THE NEW INTERNATIONAL YEAR BOOK

A COMPENDIUM OF THE WORLD'S
PROGRESS

FOR THE YEAR

1927

1928

PREFACE

THE NEW INTERNATIONAL YEAR BOOK, in its twenty-sixth volume herewith presented, furnishes a concise yet comprehensive historical narrative for the year 1927. Arranged along lines which for many years have proved so serviceable, it aims, in the small compass of a single volume, to reflect and record the more noteworthy activities of the year under review. Manifestly, the YEAR BOOK, even with an increased staff of contributors, can deal but in outline with the many topics it seeks to cover, but the selected bibliographies accompanying many of the articles serve to indicate the manner and extent of the increase of human knowledge during the year. These bibliographies have proved so welcome a feature to librarians and others that the contributors to the YEAR BOOK have been encouraged to extend them.

In the 1927 YEAR BOOK there are certain new features which deserve special mention. For many years there has been carried an article, FINANCIAL REVIEW. This has been retained in the 1927 YEAR BOOK, and in addition authoritative articles on BANKS AND BANKING, BUSINESS REVIEW, PUBLIC FINANCE, and TAXATION have been added, which record the year's activity in these respective fields, and which are allied with present-day economic and political conditions. A distinctly timely special article on INVESTMENT TRUSTS has also been prepared, which undoubtedly will prove of service. In the field of POWER ENGINEERING a new contributor discusses advances in this branch of mechanical engineering, so closely allied with industrial developments.

As usual, articles on LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; PHILOLOGY, MODERN; SCANDINAVIAN LITERATURE, and SPANISH LITERATURE are available, and furnish an interesting and acceptable record of intellectual activity. For the first time there is presented an article on SPANISH-AMERICAN LITERATURES which affords a useful chronicle of the productive effort in literature in Central America and South America, a field too often ignored in the northern hemisphere, and one that the YEAR BOOK is glad to cultivate.

THE LEAGUE OF NATIONS, with its meetings and the discussions it developed, continued in interest, and the record of the proceedings of its Council and committees shows important advances. The progress of Europe was marked everywhere by general improvement, particularly as evidenced under FRANCE, GERMANY, POLAND, and RUSSIA, while CHINA continued in a more or less turbulent condition.

Each year the YEAR BOOK seeks to give the more important events and the commercial progress of the various countries on the American Continent. In addition to the outline of the history of the year, the more essential commercial statistics are presented, derived from such authoritative sources as the Bureau of Foreign and Domestic Commerce of the United States Department of Commerce, the Dominion Statistician of Canada, the Bureau of Pan American Republics and other official agencies to which the Editor of the YEAR BOOK is pleased to express his indebtedness.

In 1927 the State articles assumed added importance, due to the fact that

PREFACE

so many of their legislatures were in session. In their preparation the interest of many State officials has been generously manifested and unusual efforts have been made to secure accuracy in their compilation. Similar coöperation has been received from the headquarters' officials of the various churches and religious denominations and from the secretaries of universities and colleges. The same statement applies to the national and other societies from which information has been received and used in preparing the articles. Obviously, it is impossible to mention the names of so many kind friends to whom the YEAR BOOK is indebted in one way or another.

Unusual events of the year include such topics as the SACCO-VANZETTI CASE, in Massachusetts, which up to its very close held the attention of the entire world. The serious FLOODS in the Mississippi Valley and New England, with their vast destruction, receive special treatment at the hands of the contributor of METEOROLOGY. PROHIBITION, while no longer novel, continued a topic of prime interest and the YEAR BOOK article reflects the discussion not only in the United States, but in other countries. Under AERONAUTICS are described the great transatlantic flight of Colonel Charles A. Lindbergh and other notable achievements of the year in this field. Important awards of NOBEL PRIZES were made in 1927. Science made its advances, as recorded under ANTHROPOLOGY, BOTANY, CHEMISTRY, GEOLOGY, MINERALOGY, PSYCHOLOGY, and ZOÖLOGY; while there were notable developments in Medicine and Surgery as well as in VETERINARY MEDICINE.

The obituary record of the year serves to emphasize the passing of important men and women of whom brief biographies are as usual included.

HERBERT TREADWELL WADE.

EDITOR
HERBERT TREADWELL WADE

LIST OF CONTRIBUTORS

AGRICULTURE, BOTANY, FOOD, FORESTRY, HORTICULTURE, ETC.

EDWIN WEST ALLEN, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE,
AND
ALFRED CHARLES TRUE, PH.D.,
UNITED STATES DEPARTMENT OF AGRICULTURE;
WALTER H. EVANS, PH.D. (BOTANY AND
PLANT DISEASES); JOHN I. SCHULTE (CROP
PRODUCTION); GEORGE HAINES (LIVESTOCK;
DAIRYING); WALTER H. BEAL (FERTILIZERS
AND SOILS); SYBIL L. SMITH (FOOD AND
NUTRITION); HOWARD L. KNIGHT (AGRICULTURAL
LEGISLATION); JOSEPH W. WELLINGTON (HORTICULTURE
AND FORESTRY); AND WILLIAM A. HOOKER (ECONOMIC
ENTOMOLOGY; VETERINARY MEDICINE).

ANTHROPOLOGY (WITH ETHNOLOGY)

LESLIE SPIER, PH.D.,
PROFESSOR OF ANTHROPOLOGY, UNIVERSITY OF
OKLAHOMA.

ARCHAEOLOGY

OLIVER SAMUEL TONKS, PH.D.,
PROFESSOR OF ART, VASSAR COLLEGE.

ARCHITECTURE

TALBOT F. HAMLIN,
MEMBER OF AMERICAN INSTITUTE OF ARCHITECTS.

ASTRONOMY; METEOROLOGY; EARTHQUAKES; FLOODS; RELATIVITY

EDGAR W. WOOLARD,
UNITED STATES WEATHER BUREAU.

BIOGRAPHY

THE OFFICE STAFF.

CHEMISTRY; EXPOSITIONS; CELEBRATIONS

MARCUS BENJAMIN, PH.D., Sc.D., LL.D.,
EDITOR FOR THE UNITED STATES NATIONAL
MUSEUM.

CIVIL ENGINEERING; AERONAUTICS

HERBERT TREADWELL WADE.

DRAMA AND THEATRE

AVERELL BROUGHTON, A.M.

**ECONOMIC, SOCIAL AND POLITICAL
SCIENCE SUBJECTS**

L. M. HACKER, A.M.

EDUCATION; UNIVERSITIES

MILTON B. HILLEGAS, PH.D., LL.D.,
PROFESSOR OF EDUCATION, COLUMBIA UNIVERSITY.

ELECTRICAL ENGINEERING SUBJECTS

REGINALD GORDON,
FORMERLY ASSOCIATE EDITOR OF *Industrial Management*.

EUROPEAN HISTORY AND GAZETTEER

IRWIN SCOFIELD GUERNSEY, A.M.,
PROFESSOR OF AMERICAN HISTORY, DE WITT CLINTON
HIGH SCHOOL, NEW YORK CITY.

**EXPLORATION; POLAR RESEARCH;
ALASKA**

A. W. GREELY, PH.D.,
MAJOR GENERAL, UNITED STATES ARMY, RETIRED;
COMMANDER GREELY POLAR EXPEDITION.

**FINANCIAL REVIEW; BANKS AND
BANKING; BUSINESS REVIEW; INVESTMENT
TRUSTS; PUBLIC FINANCE; TAXATION**

H. PARKER WILLIS, PH.D.,
EDITOR, *The Journal of Commerce*, NEW YORK;
PROFESSOR OF BANKING, COLUMBIA UNIVERSITY.

FRENCH LITERATURE

ALBERT SCHINZ, PH.D.,
PROFESSOR OF FRENCH LITERATURE, SMITH
COLLEGE.

GEOLOGY

DAVID HALE NEWLAND,
FORMERLY ASSISTANT STATE GEOLOGIST OF NEW
YORK.

GERMAN LITERATURE

AMELIA VON ENDE.

INSURANCE

WILLIAM S. CRAWFORD,
INSURANCE EDITOR, *The Journal of Commerce*,
NEW YORK.

**ARBITRATION; INTERNATIONAL LAW;
LEAGUE OF NATIONS; WORLD COURT;
PEACE MOVEMENTS; ETC.**

CLINTON ROGERS WOODRUFF, LL.D.,
HONORARY SECRETARY OF THE NATIONAL MUNICIPAL
LEAGUE AND MEMBER OF THE MOHONK CONFERENCE;
FORMERLY PRESIDENT OF THE BOARD OF PERSONAL
REGISTRATION, PHILADELPHIA.

LABOR LEGISLATION

JOHN B. ANDREWS, PH.D.,
SECRETARY OF THE AMERICAN ASSOCIATION FOR
LABOR LEGISLATION AND EDITOR OF *American Labor
Legislation Review*.

LITERATURE, ENGLISH AND AMERICAN

WILLIAM BENFIELD PRESSEY, A.M.,
ASSISTANT PROFESSOR OF ENGLISH, DARTMOUTH
COLLEGE.

MEDICAL SUBJECTS
EDWARD PREBLE, M.D.

METALLURGY
EDWARD HODGES ROBIN,
ASSOCIATE EDITOR OF *Engineering and Mining Journal*.

MILITARY PROGRESS
JOHN J. BRADLEY,
COLONEL, INFANTRY, UNITED STATES ARMY,
RETIRED.

MINERALOGY
HERBERT P. WHITLOCK, C.E.,
CURATOR DEPARTMENT OF MINERALOGY, AMERICAN MUSEUM OF NATURAL HISTORY, NEW YORK CITY.

MUSIC
ALFRED REMY, M.A.,
EXTENSION LECTURER, COLUMBIA UNIVERSITY,
AND FORMERLY PROFESSOR OF HARMONY AND COUNTERPOINT, INTERNATIONAL CONSERVATORY,
NEW YORK; EDITOR OF *Baker's Biographical Dictionary of Musicians*.

NAVAL PROGRESS AND RELATED SUBJECTS
LEWIS SAYRE VAN DUZER,
CAPTAIN, UNITED STATES NAVY, RETIRED;
WRITER ON NAVAL AND NAUTICAL SUBJECTS.

PAINTING AND SCULPTURE
EVELYN VAN NORMAN.

PHILOLOGY (CLASSICAL)
CHARLES KNAPP, PH.D.,
PROFESSOR OF GREEK AND LATIN, BARNARD COLLEGE, COLUMBIA UNIVERSITY; MANAGING EDITOR OF *The Classical Weekly*.

PHILOLOGY (MODERN)
JOHN LAWRENCE GERIG, PH.D., LITT.D.
AD. HON. (UNIVERSITY OF ROME); PROFESSOR OF CELTIC, EXECUTIVE OFFICER, DEPARTMENT OF ROMANCE LANGUAGES, COLUMBIA UNIVERSITY; HONORARY DIRECTOR, DEPARTMENT OF SPANISH STUDIES, UNIVERSITY OF PORTO RICO; CAVALIERE DELLA CORONA D'ITALIA; CHEVALIER DE LA LEGION D'HONNEUR. EDITOR OF *Romanic Review*, etc.

PHILOSOPHY
JEROME ROSENTHAL, A.M.,
BENJAMIN GINZBURG, PH.D.

PHYSICS
HENRY D. HUBBARD,
SECRETARY, UNITED STATES BUREAU OF STANDARDS.

POWER ENGINEERING; POWER PLANTS; ETC.
ALFRED D. BLAKE, M.E.,
ASSOCIATE EDITOR OF *Power*.

PSYCHOLOGY; PSYCHICAL RESEARCH; PSYCHO-ANALYSIS
BENJAMIN GINZBURG, PH.D.

RAILWAYS
WILLIAM E. HOOPER,
FORMER FINANCIAL EDITOR, *Railway Age*.

RELIGIOUS BODIES AND SOCIETIES
ELLEN NELSON COLLIERAN, OFFICE EDITOR.

ROMAN CATHOLIC CHURCH
THOMAS F. MEEHAN,
EDITORIAL STAFF, *America*.

SANITARY ENGINEERING AND MUNICIPAL SUBJECTS
MOSES NELSON BAKER, PH.D., C.E.,
ASSOCIATE EDITOR OF *Engineering News-Record*.

SCANDINAVIAN LITERATURE
HARRY V. E. PALMBLAD, PH.D.,
PROFESSOR OF GERMAN AND FRENCH, PHILLIPS UNIVERSITY.

SPANISH LITERATURE; SPANISH-AMERICAN LITERATURES
JOHN D. FITZ-GERALD, PH.D., LITT.D.,
PROFESSOR OF ROMANCE PHILOLOGY, UNIVERSITY OF ILLINOIS; MEMBER OF THE HISPANIC SOCIETY OF AMERICA; CORRESPONDING MEMBER OF THE SPANISH ROYAL ACADEMY, AND OF THE ROYAL ACADEMY OF HISTORY OF MADRID.

SPORTS
CHARLES A. TAYLOR,
SPORTING DEPARTMENT, *New York American*.

UNITED STATES AND STATE ARTICLES
PHILIP COAN,
EDITORIAL STAFF, *The Brooklyn Daily Eagle*;
FORMER EDITOR OF *The New York Sun*.

ZOOLOGY AND EVOLUTION
AARON L. TREADWELL, PH.D.,
DEPARTMENT OF ZOOLOGY, VASSAR COLLEGE.

KEY TO PRONUNCIATION

ā as in ale, fate. Also see **ɛ**, below.
ā " " senate, chaotic.
ā " " glare, care, and as **e** in there. See **ɛ**, below.
ā " " am, at.
ā " " arm, father.
ā " " ant, and final **a** in America, armada, etc.
 In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short **u** (**ū**).
“ " " final, regal, where it is of a neutral or obscure quality.
ā " " all, fall.
ē " " cvc.
ē " " elate, evade.
ē " " end, pet. The characters **ē**, **ā**, and **ā** are used for **ä**, **ae** in German, as in Baedeker, Gräfe, Händel, to the values of which they are the nearest English vowel sounds. The sound of Swedish **d** is also sometimes indicated by **ē**, sometimes by **ā** or **ā**.
ē " " fern, her, and as **i** in sir. Also for **ō**, **oe**, in German, as in Göthe, Goethe, Ortel, Oertel, and for **eu** and **œu** in French, as in Neufchâtel, Crèveccœur; to which it is the nearest English vowel sound.
e " " agency, judgment, where it is of a neutral or obscure quality.
i " " ice, quiet.
i " " quiescent.
i " " ill, fit.
ī " " old, sober.
ō " " obey, sobriety.
ō " " orb, nor.
ō " " odd, forest, not.
o " " atom, carol, where it has a neutral or obscure quality.
oi " " oil, boil, and for **eu** in German, as in Feuerbach.
ou " " food, fool, and as **u** in rude, rule.
ū " " house, mouse.
ū " " use, mule.
ū " " unite.
ū " " cut, but.
ū " " full, put, or as **oo** in foot, book. Also for **u** in German, as in München, Müller, and **u** in French, as in Buchez, Budé; to which it is the nearest English vowel sound.
ū " " urn, burn.
y " " yet, yield.
z " " the Spanish Habana, Córdoba, where it is like a **v** made with the lips alone, instead of with the teeth and lips.
ch " chair, cheese.

ɔ as in the Spanish Almodovar, pulgada, where it is nearly like **th** in English then, this.
g " " go, get.
g " " the German Landtag, and **ch** in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
h " **j** in the Spanish Jijona, **g** in the Spanish gila; where it is a fricative somewhat resembling the sound of **h** in English huc or **y** in yet, but stronger.
hw " **wh** in which.
k " **ch** in the German ich, Albrecht, and **g** in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of **h** in huc, or **y** in yet; or the sound made by beginning to pronounce a **k**, but not completing the stoppage of the breath. The character **x** is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of **kh** in the word Khan.
ɲ " in sinker, longer.
ng " sing, long.
n " the French bon, Bourbon, and **m** in the French Etampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by **n**, as in the case of São Antão.
sh " shine, shut.
th " thrust, thin.
th " then, this.
zh " **z** in azure, and **s** in pleasure.
 An apostrophe (') is sometimes used to denote a glide or neutral connecting vowel, as in tū'b'l (table), kīz'm (chasm).
 Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
 When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. Pronunciation is discussed in the NEW INTERNATIONAL ENCYCLOPEDIA.

THE NEW INTERNATIONAL YEAR BOOK

ABBEMA, ab-bá'mă, LOUISE. French painter, died at Paris, France, July 29. She was born at Étampes in 1855. Her work was first exhibited at the Salon in 1874, and later she executed decorative panels for various town halls, for the Hôtel de Ville in Paris, the Musée de l'Armée, the Theatre Sarah Bernhardt, the hall of the National Society of Horticulture of France, the Abbey of Fécamp, the Palace of the Governor of Dakar, and other buildings. She painted many portraits, including those of Sarah Bernhardt, of whom she was a lifelong friend, Ferdinand de Lesseps, and Dom Pedro, Emperor of Brazil. At the various exhibitions in Paris she received honorable mention and bronze and silver medals, and she was created a Chevalier of the Legion of Honor; she received, also, many other honors in France and Indo-China. She was vice-president of the Beaux Arts section of the French National Society of Horticulture.

ABBOT, EDWIN HALW. American railroad attorney and official, died at Cambridge, Mass., May 30. He was born at Beverly, Mass., Jan. 28, 1834, and was educated at the Boston Latin School and at Harvard College, graduating at the latter institution in 1855 and receiving the degree of A.M. in 1858 and that of LL.B. in 1862. He practiced law in Boston from 1862 to 1870, when he moved to Milwaukee and became general solicitor and director of the Wisconsin Central R. R. In 1878 he became vice president and trustee of this road, taking possession of it as active trustee and operating it for the bondholders from 1878 to 1889. He constructed the Wisconsin Central associated lines and, with Charles L. Colby, built the Grand Central Station and terminals in Chicago. He was the originator of the voting trust method of corporate control, which he devised for the Wisconsin Central in 1879. From 1890 to 1899 he was president and treasurer of the Wisconsin Central, the Chicago, Wisconsin and Minneapolis, and Milwaukee and Lake Winnebago roads. In 1909 he retired from business, having brought about an amicable union of all the Wisconsin Central roads into one company, notwithstanding strong opposition. With W. W. Crago he established the first car-ferry for entire trains across Lake Michigan between Manitowoc and Ludington, a distance of 54 miles. He was also director of the Atchison, Topeka and Santa Fé and the Northern Pacific, 1887-93. In 1905-06 he was active in life insurance reforms, serving as chairman of the Massachusetts Policy Holders'

Committee. He contributed to various reviews and magazines, and lectured at many universities.

ABBOT, HENRY LARCOM. American soldier and engineer, died at Cambridge, Mass., October 2, being at the time of his death the oldest retired army officer and the oldest graduate of the U. S. Military Academy. He was born at Beverly, Mass., Aug. 13, 1831, and graduated at the U. S. Military Academy in 1854, entering the Corps of Engineers, in which organization he served until he retired from the Army in 1895. His first engineering work was done in connection with the survey of the Pacific Railroad and the hydrographic survey of the Mississippi River delta. During the Civil War he was actively engaged in engineering and artillery operations, his most important service being in command of the siege artillery in the operations around Richmond in 1864. He was wounded at Bull Run, in 1861. At the close of the war he was brevetted Major General of Volunteers, and returned to the regular army, being placed in command of the engineer post at Willets Point, N. Y. While there he developed a torpedo and submarine defense of the Long Island Sound approach to New York City, and founded the school for engineers. Much of the work of developing submarine mines and mortar batteries, and the defense and fortifications of the United States, was carried on under his direction or by boards and commissions of which he was a member. In addition to military engineering he became active in civil engineering, particularly in hydrographic work. He was a member of the board to devise a plan for the protection and reclamation of the Mississippi basin, and much of the levee work and the carrying out of plans for the protection of the neighboring land were done under his direction. He was also president of a board of consulting engineers which considered the proposed ship canal from Pittsburgh to Lake Erie, and he designed the harbor at Manitowoc, Wisconsin. After his retirement from the army he served on important engineering commissions, and in May, 1897, he was appointed a member of the technical committee of the New Panama Canal Company. He was elected a member of the National Academy of Sciences in 1872. He was the author of *Siege Artillery in the Campaign against Richmond* (1867); *Experiments and Investigations to Develop a System of Submarine Mines for Defending Harbors of the United States* (1881), and, with Gen. A.

A. Humphreys, *Physics and Hydraulics of the Mississippi*; he wrote, also, a large number of reports of military and engineering commissions and boards. Among his later writings may be mentioned *Problems of the Panama Canal* (1905-07).

ABERT, ßb-ért, HERMANN. German musicologist, died at Berlin, in September. He was born at Stuttgart, Mar. 25, 1871. He received his musical instruction from his father and at the conservatory of his native city. In 1902 he established himself as privatdozent at the University of Halle, becoming full professor in 1909. In 1919 he succeeded Riemann as professor of music at the University of Leipzig, and in 1923 was called to the University of Berlin as successor to Kretzschmar. His principal work is the monumental biography of *Mozart* (2 vols., 1920-21), begun originally as a revision of Jahn's book. Other works are *Schumann* (1903); *Mozarts Persönlichkeit* (1923) and several valuable monographs on early music.

ABORTION IN LIVESTOCK. See VETERINARY MEDICINE.

ABYSSINIA. See ETHIOPIA.

ACADEMY, FRENCH (ACADÉMIE FRANÇAISE). The oldest of the five academies which make up the Institute of France, and officially considered the highest; founded in 1635, reorganized in 1816. The list of the Immortals at the beginning of 1927 was as follows: Paul Bourget; Gabriel Hanotaux; Henri Lavedan; René Bazin; Maurice Donnay; Raymond Poincaré; Eugène Brieux; R. Doumic; Marcel Prévost; Henri de Régnier; Maréchal Lyautey; H. R. D. Cochin; Pierre de la Gorce; Henri Bergson; Maréchal Joffre; Louis Barthou; Monsignor Baudrillart; François de Curel; Jules Cambon; Georges Clemenceau; Maréchal Foch; H. Bordeaux; Robert de Flers; Joseph Bédier; André Chevrillon; Pierre de Nolhac; Georges Goyau; Georges de Porto-Riche; Edouard Estaunié; Maître Henri Robert; Charles Jonnart; Abbé Bremond; Georges Lecomte; Emil Picard; Albert Besnard; Paul Valéry; Auguste Armand Ghislain Marie Joseph Nomphe de Caumont; Duke de la Force; and Louis Bertrand.

During the year the Marquis de Flers (q.v.) a member of the Academy, died, while two members were elected to take the places of Jean Richepin and René Boylesve-Tardiveau who died in 1926. The new Immortals were M. Abel Hermant, an author and playwright, and M. Emile Male, director of the French School at Rome. Monsieur Hermant was born at Paris, Feb. 3, 1862, and was educated at the Lycée Bonaparte, Condorcet, receiving the degree of Licencié es lettres. He was president of the Société des Gens de Lettres in 1902, and a member of the Société des Auteurs et Compositeurs Dramatiques. He was well known as a writer of novels and plays and as a journalist, contributing weekly articles concerning Parisian matters to the *Temps*, and as a grammatical purist, as shown in his *Entretiens sur la Grammaire Française* (1923). His best known novels are: *Le Cavalier Miserey* (1887); *Serge*; *Les Confidences d'une Aïeule* (1893); *La Currière*; *Les Transatlantiques* (1897); *La Meute*; *Souvenirs du Vicomte Courpière* (1901); *Les Grands Bourgeois*; *La Discorde*; and *Heures de Guerre de la Famille Valadier*. His play, *La Meute*, taken from his novel of the same name, not only was successful when produced at the Théâtre de la Renaissance

in 1896, but brought on a duel between its author and the Prince de Sagan. His play, *Les Transatlantiques*, written in 1897, satirizes both Americans and French with much humor.

Monsieur Emile Male was born in Commentry in the Allier in 1862, and was educated at the Lycées de Saint-Étienne, Louis-le-Grand, and was a former pupil of l'École Normale Supérieure. He devoted himself to questions of art, particularly religious art, and his work *L'Art Religieux au Treizième Siècle*, written in 1898 as a thesis for a doctorate, was crowned by the Académie des Inscriptions et Belles Lettres. He was professor of medieval art at the Sorbonne for several years, and a member of the Société des Antiquaires de France. In addition to the work cited he was the author of: *L'Art religieux à la fin du moyen âge* (1908); *L'Art allemand et l'art français du moyen âge* (1917); and *L'Art religieux du XII^e siècle en France* (1922).

The daily press stated that among the candidates for the two seats who failed to secure the requisite number of votes were Professor Richet of the Sorbonne, Claude Farrère, and the Comte de Blois.

Announcement was made towards the end of the year of the election to the Academy of Louis Madelin, a French historian and man of letters, succeeding the late Robert de Flers (q.v.). Emile Marie Louis Madelin was born May 8, 1871, and was educated at the Collège Fénélon, Bar-le-Duc, France; the University of Nancy, and l'École de Chartes. He became a fellow of the university and a doctor of letters, and was formerly connected with the French school in Rome. In 1907-8 he lectured, as a representative of the Alliance Française, in the United States and Canada. He was elected vice president of the Société des Gens de Lettres in 1919. M. Madelon saw active service during the War, and received the Croix de Guerre and election as a Chevalier of the Legion of Honor. He wrote: *Fouché* (1901), which received a prize from the French Academy; *La Rome de Napoléon* (1903), second Gobert prize of the Academy; *Oroquis Lorrains* (1905); *La Révolution* (1910), grand prize Gobert; *France et Rome* (1911); *Danton* (1912); *La Bataille de France* (1919); *Les Heures Merveilleuses d'Alsace et de Lorraine* (1920); *Le Chemin de la Victoire* (1921); *L'Expansion Française* (1921).

ACADEMY OF ARTS AND LETTERS, AMERICAN. A society founded in 1904 by members of the National Institute of Arts and Letters, and incorporated and given a charter by Act of Congress approved April 17, 1916. The purposes of the organization are the furtherance of the interests of literature and the fine arts. The membership, limited to 50 chairs, is similar to that of the French Academy, and vacancies caused by death are filled by election by the members from the National Institute on the basis of lifetime achievement in literature, painting, sculpture, architecture, and music. At the annual meeting on Nov. 10, 1927, four new members were elected: John Russell Pope, Edwin Arlington Robinson, James Earle Fraser and John Huston Finley, to fill the vacancies caused by the deaths of: John Singer Sargent, who died Apr. 15, 1925; Stuart P. Sherman, who died Aug. 21, 1926; James Ford Rhodes, who died Jan. 22, 1927; and Albert J. Beveridge, who died Apr. 27, 1927. In addition to the four named, the membership in 1927 included the

following in order of election: Daniel Chester French; William Milligan Sloane; Robert Underwood Johnson; Henry van Dyke; William Crary Brownell; Arthur Twining Hadley; Edwin Howland Blashfield; Thomas Hastings; Brander Matthews; George Edward Woodberry; George Whitefield Chadwick; George de Forest Brush; William Rutherford Mead; Bliss Perry; Abbott Lawrence Lowell; Nicholas Murray Butler; Owen Wister; Herbert Adams; Augustus Thomas; Timothy Cole; Cass Gilbert; Robert Grant; Frederick MacMonnies; William Gillette; Paul Elmer More; Gari Melchers; Elihu Root; Brand Whitlock; Hamlin Garland; Paul Shorey; Charles Adams Platt; Archer Milton Huntington; Child Hassam; David Jayne Hill; Lorado Taft; Booth Tarkington; Charles Dana Gibson; John Charles Van Dyke; Royal Cortissoz; Henry Hadley; Charles Downer Hazen; George Pierce Baker; Edwin Anderson Alderman; Edward Channing; Wilbur L. Cross; and Hermon A. MacNeil.

At a public meeting held on April 21, 1927, the Academy presented to Miss Edith Wynne Mathison its gold medal for good diction on the stage, which had been awarded by a ballot of the Academy.

The Directors of the Academy in 1927 were: President, William Milligan Sloane; Chancellor, Nicholas Murray Butler; Secretary, Robert Underwood Johnson; Treasurer, Thomas Hastings; Wilbur L. Cross, Hamlin Garland, Cass Gilbert, Archer Milton Huntington, and Augustus Thomas. The Academy has headquarters in its building at 633 West 155th Street, New York.

ACCIDENTS. See RAILWAY ACCIDENTS; SAFETY AT SEA.

ACKERT, CHARLES H. American railway official, died at Chicago, Ill., June 5. He was born in Dutchess County, N. Y., Feb. 19, 1856. Entering the railway service in 1872 as a telegraph operator, in 1888 he became general manager of the Iowa Central Ry. In 1893 he was appointed general manager of the Elgin, Joliet & Eastern Ry., succeeding in 1899 to the presidency of the company, and also of the Chicago, Lake Shore and Eastern Ry. In 1901 he became general manager of the Mobile and Ohio, and on March 15, 1902, he was appointed general manager of the Southern Ry. Three years later he was elected fourth vice president of the Southern, resigning to become vice president of the Chicago and Alton in 1909. He retired from active railway service in 1917, when he became president of the National Railway Time Service Company of Chicago.

ACOUSTICS. See PHYSICS.

ADAMS, BROOKS. American author and lawyer, died at Boston, Mass., February 13. He was born at Quincy, Mass., June 24, 1848, the son of Charles Francis and Abigail Brown (Brooks) Adams, and graduated from Harvard College in 1870. After a year at the Harvard Law School he went to Geneva as secretary to his father, when the latter was a member of the Alabama Claims Arbitration Commission. He was admitted to the bar of Massachusetts in 1873, and engaged in active practice at Boston until 1881. He served as lecturer in the Boston University School of Law from 1904-11, and

was a delegate to the Massachusetts State Constitutional Convention in 1917. His more notable writings include: *The Emancipation of Massachusetts* (1887); *The Law of Civilization and Decay* (1896) (translated into French and German); *America's Economic Supremacy* (1900) (translated into German); *The New Empire* (1902) (translated into German and Russian); two chapters in *Centralization and the Law* (1905); *Railways as Public Agents* (1910); *The Theory of Social Revolutions* (1913); and *Emancipation of Massachusetts—The Dream and the Reality* (1919).

ADAMS, EDWIN AUGUSTUS. American clergyman and former pastor of the Bethlehem Congregational Church of Chicago, died at Walpole, Mass., April 10. He was born at Franklin, Mass., Oct. 21, 1837, and graduated at Amherst College in 1861, later studying at Union College and at Andover Theological Seminary. His first pastorate was at North Manchester, Conn. where he was from 1868 to 1872, and from 1873 to 1882 he served as a missionary at Prague, in Bohemia, now Czechoslovakia. He became pastor of the Bethlehem Congregational Church in Chicago, serving for thirty-four years, when he retired to his home at Walpole. He was the father of six distinguished children, Prof. Edwin P. Adams of Princeton, Prof. George P. Adams of the University of California, Prof. Kathryn Adams, President of Constantinople College for Women, Prof. Elizabeth Adams of Olivet College, Mrs. E. H. Harper, and Miss Rebecca B. Adams.

ADELBERT COLLEGE. See WESTERN RESERVE UNIVERSITY.

ADELPHI COLLEGE. A non-sectarian college of arts and sciences for women, at Brooklyn, N. Y.; incorporated in 1896. In the autumn of 1927 there were 600 students in the regular courses leading to the A.B. degree, distributed as follows: Seniors, 128; juniors, 142; sophomores, 161; freshmen, 169. The summer school registration was 112. The faculty numbered 41, the following additions having been made: One assistant professor each in biology, economics and sociology, education, an instructor in French, and an instructor in English and Latin. The income for the year was \$187,577.34. The library contained over 18,000 volumes. President, Frank Dickinson Blodgett, A.M., LL.D.

ADEN, a'den or s'den. A volcanic peninsula on the Arabian coast belonging to Great Britain; about 100 miles east of Bab-el-Mandeb. Area, 75 square miles; including the protectorate, about 9000 square miles. The settlement comprises also the peninsula of Little Aden, and some villages on the mainland, and the island of Perim, the last named having an area of 5 square miles. In 1921 the population of Aden and Perim was 54,923, of whom 80 per cent were Mohammedans. The population of the protectorate was about 100,000. The manufactures, which are unimportant, consist chiefly of salt and cigarettes.

Aden is the principal commercial centre of the Arabian peninsula and the entrepôt for the Red Sea markets of Ethiopia, Eritrea, and Somaliland. It possesses great importance as a fueling station owing to its position halfway between Europe and the Orient and to its low prices for fuel, oil being imported free of duty and coal obtained cheaply from South Africa. The imports for the 1925-26 period amounted to \$32,032,000 and the exports to \$26,756,000. A

large amount of this commerce represents transhipped goods. The chief imports are cotton piece goods, grain, coal, coffee, sugar, hides and skins, tobacco, fruit, vegetables, and other provisions; and among the chief exports, coffee, gums, hides and skins, cotton goods, tobacco, grain, sugar, and provisions. In 1925-26, 1315 merchant vessels of 4,356,326 tons entered the port of Aden; 678 of these were British.

Attached to Aden are the Kuria Muria islands off the Arabian coast, five in number, ceded by the Sultan of Muskat. Aden is under a British political resident with four assistants, the British Colonial Office having charge of all political questions and the British War Office of military questions. Beginning with Apr. 1, 1927, the Government of India, which has charge of the internal administration of the settlement, was to contribute a fixed sum of £250,000 a year for three years towards the military and political charges, and thenceforward one-third of these charges, subject to a maximum of £150,000 a year. Political resident and general officer commanding in 1927, Maj.-Gen. J. H. K. Stewart.

ADULT EDUCATION, AMERICAN ASSOCIATION FOR. An organization formed in 1926 to serve as a source of information concerning adult education activities, and particularly to act as a clearing house through which the experience and findings of each adult education enterprise may be made available to others. The Association seeks, also, to advise those who are already engaged in adult education, to aid those who are planning to initiate such work, to publish and secure the publication of material useful to those in the field, and to assist in studies of problems fundamental to adult education.

It is the Association's view that adult education should count in its enrollment those men and women, young and old, who are pursuing some kind of education after working hours, either by correspondence, under public library guidance, or in university extension classes, workers' classes, folk schools, institutes or museum classes. In such institutions new theories and practices of education are being worked out with their own problems, methods and literature. Studies of adult education, published by the Association, approached the subject from two angles. First, came the reports of surveys, covering five great divisions of adult education, which were made under the auspices of the Carnegie Corporation of New York. The volumes issued were: *Libraries and Adult Education*, American Library Association; *New Schools for Older Students*, Nathaniel Peffer; *Educational Opportunities for Young Workers*, Owen D. Evans; *The University Afield*, Alfred L. Hall-Quest; *Correspondence Schools, Lyceums, Chautauquas*, John S. Noffsinger. Second, were cross-section studies of the varied adult education facilities in such selected communities as Buffalo, Cleveland, Chicago, and Detroit. The report of the survey of Buffalo had already been printed and others were in course of preparation at the close of the year. The Association published an occasional *Journal*, which it hoped in time to expand into a quarterly or monthly periodical. Up to the end of 1927 it had held two national conferences with a numerous attendance of educators. It is affiliated with the World Association for Adult Education.

The Association conducted four teacher-

training courses at the New School for Social Research, New York, during the winter of 1926-27, where teachers learned how to humanize their knowledge, in accordance with the principle that one of the primary needs in adult education is a corps of teachers whose scholarship measures up to the highest academic standards, and who are also capable of working out new methods by which they can present their subjects in vivid, unacademic form. Membership in the Association is open to individuals or groups interested in adult education. It depends for its financial support upon dues from members, and upon the interest of private individuals and of educational foundations. The officers of the Association in 1927 were: President, Dean James E. Russell, of Teachers College, Columbia University; vice-president, Prof. Leon J. Richardson, University of California; treasurer, J. H. Puelicher, American Bankers' Association, Milwaukee; secretary, Miss Margaret Burton, National Board of the Young Women's Christian Association, New York; executive director, Morse A. Cartwright, New York. The foregoing with fourteen other members composed the executive board of the Association. National headquarters are at 41 East 42nd Street, New York.

ADVANCEMENT OF SCIENCE. AMERICAN ASSOCIATION FOR THE. Founded in 1848 to advance science, to give a stronger and more general impulse and more systematic direction to scientific research, and to procure for the labors of scientific men increased facilities and a wider usefulness. In 1927 its membership included over 15,000 individuals interested in the advancement of science and the progress of knowledge and education, 116 autonomous and independent associated scientific societies, of which 85 were officially affiliated with the Association, 23 being local academies of science. The direction of the association rests in a council consisting of the officers, representatives of the affiliated societies and academies, and eight members elected at large by the council. It holds an annual meeting at the same time as the association and operates in the interim through an executive committee. The activities of the association are of three kinds: Those related to the holding of the annual and other meetings; those related to publications; and those related to the advance of knowledge by research. It has 15 sections representing the main current subdivisions of science, as follows: Mathematics, physics, chemistry, astronomy, psychology, social and economic sciences, historical and philological sciences, anthropology, geology, zoological sciences, botanical sciences, engineering, medical science, agriculture, and education.

The official organ of the association is a weekly journal, *Science*, which furnishes an open forum for the discussion of questions regarding science and education, almost every branch of scientific knowledge being represented in its columns. In addition the association issues an elaborate programme for each annual meeting, and it publishes at four-year intervals a volume of summarized *Proceedings*, including a directory of members. The permanent endowment of the Association, the income from which is employed to advance scientific research, amounted in 1927 to \$142,476.66; grants are made annually to individuals or scientific organizations to promote research. Two regional divisions are conducted

by the Association: The Pacific Division, including the Pacific States, Alaska, the Philippines, and the Hawaiian Islands, and the Southwestern Division, including Arizona, New Mexico, Colorado, western Texas, and northern Mexico. These divisions are autonomous, holding annual and other meetings and engaging in other projects in their respective fields.

The eighty-fourth meeting of the Association convened in Nashville, Tenn., Dec. 26 to 31, 1927, with an attendance of 1662, this being one of the smaller meetings. Twenty-nine associated societies met with the Association and 163 sessions were held, at which 1191 papers and addresses were read. The science exhibition was well developed, with exhibits by commercial firms as well as by individual research workers and research institutions and laboratories. Dr. Arthur A. Noyes, eminent chemist, of the California Institute of Technology, was president at this meeting.

The annual Association prize of \$1000 was awarded to Dr. H. J. Muller of the University of Texas for his outstanding contribution to our knowledge of the influence of X-rays on inheritance. The standing committee of the Association on the place of the sciences in education, with Dr. Otis W. Caldwell of Columbia University as chairman, was making a survey of this subject. There was also a committee of 100 on general scientific research, the secretary of which was Dr. Rodney H. True of the University of Pennsylvania. The permanent secretary of the Association is Dr. Burton E. Livingston of Johns Hopkins University, from whom information regarding the organization may be secured by addressing him at the headquarters of the Association, Smithsonian Institution Building, Washington, D. C. The president of the Association elected for 1928 was Henry Fairfield Osborn, president of the American Museum of Natural History. It was decided to hold the 1928 meeting from Dec. 27, 1928 to January 2, 1929, at New York City.

ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR. The American Association for the Advancement of Science (q.v.) held its 1927-28 meeting in Nashville, Tenn., Dec. 26-31, 1927. The Pacific Division met at Reno, Nev., June 22-24, 1927, and the Southwestern Division met at Santa Fe, New Mexico, Apr. 12-14, 1927. The British Association for the Advancement of Science (q.v.) met at Leeds, Aug. 31-Sept. 7, 1927. The Indian Scientific Congress met at Lahore, India, January 3-8, and the South African Association for the Advancement of Science met at Salisbury, Rhodesia, June 29-July 4; the French Association for the Advancement of Science at Lyons, France, July 24-August 1; and the meeting of the Australasian Association at Hobart, Tasmania, was set for Jan. 6-20, 1928.

ADVENT CHRISTIANS. See **ADVENTISTS**.

ADVENTISTS. The Advent Movement had its origin in America with William Miller, who believed not only in the coming of Christ in person, power and glory, but that such an advent was at hand and that the date might be fixed with some definiteness. The movement, however, began in England and on the Continent, under the leadership of the Rev. Hugh McNeile and the Rev. Edward Irving, in England, and the Rev. Joseph Wolfe, D.D., LL.D., in Prussia. A Prophetic Conference was held at Albury

Park in 1836, at the residence of Henry Drummond, Esq., afterwards a member of the British Parliament, with "eight days of serious study of the prophecies," at which the Rev. Hugh McNeile presided. The first general gathering in America of those interested took place in Boston, October, 1840, the movement at that time being wholly within the existing churches, but in April, 1845, a conference was held at Albany, N. Y., at which the adherents of the Adventist doctrine were organized and a declaration of principles was adopted, embodying the views of Mr. Miller. For the next ten years this organization included practically all the Adventists, but gradually separate bodies developed, beginning with the Advent Christian Church, in 1855, and including the Seventh-Day Adventists, organized in 1860; Life and Advent Union, in 1864; The Church of God (Adventists), in 1866; and The Churches of God and Christ Jesus, in 1888.

ADVENT CHRISTIAN CHURCH. This church, which is congregational in church government, holds simply to the general immanence of Christ's return but takes the position that the day cannot be determined. It holds a biennial general conference, the meeting in 1928 to be at Dowling Park, Florida, June 17-24. Statistics of 1925, covering 46 conferences, showed 537 churches; 528 ordained ministers; 137 licensed ministers; 28,297 church members; 289 Sunday schools; 15,435 Sunday school members; 138 Young People's Societies of Loyal Workers, with 4758 members. Sixteen conferences are not included in these totals. The denomination maintains four publication societies and two educational institutions, Aurora College at Aurora, Ill., and the New England School of Theology in Boston. Periodicals published include the *World's Crisis* (Boston), *Messiah's Advocate* (Oakland), *Our Hope* (Mendota, Ill.), and *Present Truth Messenger* (Live Oak, Fla.). Among the philanthropic institutions of the denomination are the American Advent Christian Home and Orphanage at Dowling Park, Fla., and the Vernon Home for ministers and missionaries at South Vernon, Mass. The Rev. J. William Denton was general director in charge of the headquarters at 160 Warren Street, Boston 19, Mass.

SEVENTH-DAY ADVENTISTS. In 1926 this was the largest denomination of the Adventist group and embraced 12 union conferences in the United States and Canada. This denomination believes that the seventh day of the week, from sunset on Friday to sunset on Saturday, is the Sabbath established by God's law and that immersion is the only proper form of baptism. The local church is congregational in government, though under the general supervision of the conference. The statistical report of the denomination for 1926 indicated 2240 churches in the North American Division, 848 ordained ministers and 110,422 church members. Sabbath schools numbered 2734 and the membership 119,005. Figures for the foreign division were 3622 churches, 869 ordained ministers, 151,412 church members, 5542 Sabbath schools, with an enrollment of 192,013. The movement maintained in the United States and Canada 57 educational institutions, which in 1926 had 12,314 students enrolled. Of the colleges and seminaries, Loma Linda Medical College, Calif., and Pacific Union College, St. Helena, Calif., were the largest. There were also 64 educational institutions

maintained in foreign countries. The denomination had 18 publishing houses in North America, and 38 in foreign countries. Denominational literature was issued in 131 languages, and evangelistic work was conducted in 126 countries. Periodicals of the movement included: *Advent Review and Sabbath Herald* (Washington); *Signs of the Times* (Mountain View, Calif.); and *Watchman* (Nashville, Tenn.).

AERONAUTICS. The year 1927 was noteworthy not merely for the further extension of aerial navigation, but also for additional demonstrations of the capabilities of aircraft. A number of interesting flights, of which those of Charles A. Lindbergh stood out preëminent, indicated that further advances were being made

place in this competition went to E. J. Hill with A. G. Schlosser as aide in the Detroit Flying Club balloon, *Detroit III*, which landed at Skowhegan, Maine, a distance of 650 miles; and third place went to the United States Army Air Corps balloon *S-261* from Scott Field, Illinois, and piloted by Captain W. E. Kepner, U. S. A., with Lieutenant W. O. Bareckson, U. S. A., which landed at Biddeford, Me., flying 595 miles. There were 15 entries in the race including four army, three navy and eight civilian balloons, and according to the terms of the competition the balloons were limited to 35,000 cu. ft. capacity. The competition was in every way successful and the official standing of the contestants was as follows:

NATIONAL BALLOON RACE SUMMARY

Name of Pilot and Aide	Entrant	Name of Balloon	Distance in miles
1. W. T. VanOrman W. W. Morton	Goodyear Tire & Rubber Co., Akron, Ohio	<i>Goodyear V</i>	718
2. E. J. Hill A. G. Schlosser	Detroit Flying Club, Detroit, Mich.	<i>Detroit III</i>	650
3. Capt. W. E. Kepner Lt. W. O. Bareckson, U. S. A.	U. S. Army Air Corps, Scott Field, Ill.	<i>S-261</i>	595
4. J. A. Boettner J. F. Cooper	Scripps-Howard Newspapers, Ohio League		562
5. S. A. U. Rasmussen W. A. Kikoff	Detroit Flying Club, Detroit, Mich.	<i>Detroit II</i>	546
6. Lt. J. A. Powell Maj. M. R. Smith	U. S. Army Air Corps, Scott Field, Ill.	<i>S-262</i>	456
7. Lt. Paul Evert Lt. R. R. Gillespie	U. S. Army Corps, Langley Field, Va.	<i>S-265</i>	412
8. Lt. T. G. W. Settle Geo. W. Steelman	U. S. Navy, Lakehurst, N. J.	<i>S-97</i>	393
9. H. E. Honeywell R. H. Tait, Jr.	St. Louis Rotary Club, St. Louis, Mo.		384
10. Lt. Frank McKee Capt. S. T. Moore	U. S. Army Air Corps, Norton Field, Ohio	<i>S-248</i>	362
11. C. D. Williams, Jr. G. M. LeGalle	Detroit Flying Club, Detroit, Mich.	<i>Detroit I</i>	352
12. R. P. Lehr C. H. Roth	"Davey Tree" Expert Co., Kent, Ohio		320
13. C. K. Wollam Howard Wolf	Akron Beacon Journal, Akron, Ohio		315
14. Lt. Chas. Bauch Lt. F. R. Riechelderfer	U. S. Navy, Lakehurst, N. J.	<i>S-98</i>	294
15. Lt. G. V. Whittle Franklin Masters	U. S. Navy, Lakehurst, N. J.	<i>S-5861</i>	176

towards long distance and intercontinental communication. Throughout the world airways and air mail service were extended and the year witnessed a remarkable advance in the amount of commercial traffic, and particularly in the extension of air mail. Both in Europe and in America there was a marked development in the construction of municipal airports and the illumination by the government of airways. On July 1, 1927, the United States air mail service passed from the control of the government and was undertaken by private companies under contract. Some of the more notable events of the year are summarized in the following paragraphs.

BALLOONS

NATIONAL BALLOON RACE. The National Balloon Race, at which were selected the United States representatives in the International Gordon Bennett Balloon Race, was started from Akron, Ohio, on the afternoon of Memorial Day, May 30. For the third time Ward T. VanOrman was the winner, thus becoming the permanent holder of the Litchfield Cup. With W. W. Morton as aide in the balloon *Goodyear V* he accomplished a distance of 718 miles, landing on a sandy beach near Bar Harbor, Maine. Second

GORDON BENNETT BALLOON RACE. The International Gordon Bennett Balloon Race was started from the Ford Airport near Dearborn, Mich., September 10, and attracted a field of 15 starters, Germany being represented for the first time since the World War. The competition was won by the American balloon, *Detroit III*, piloted by E. J. Hill and A. G. Schlosser as aide, which landed at Baxley, Ga., a distance of 745 miles, after a flight of 47 hours, 55 minutes duration. Second place was taken by the German balloon, *Barmen*, as will appear from the accompanying table; and third, by the American balloon, *Goodyear*, with 688 and 685 miles' distance respectively. This was the sixth victory for the United States in this competition, Belgium being second with five victories. Should the United States win the trophy again in 1928, it would become the permanent property of the country. The 1927 race while not achieving the distance of previous competitions was in every way successful; at the take-off the wind was due east, but storms being encountered it was necessary to fly to the south and most of the bags landed in Georgia or South Carolina. The essential items of the competition are given in the table on the following page.

INTERNATIONAL GORDON BENNETT BALLOON RACE, FROM FORD AIRPORT, NEAR DEARBORN, MICHIGAN, SEPTEMBER 10, 1927

No.	Balloon	Country	Pilot and Aide	Landing	Duration hrs. min.	Distance* miles
1. <i>Detroit</i>		United States	E. J. Hill A. G. Schlosser	Baxley, Ga.	47.55	745
2. <i>Barmen</i>		Germany	Hugo Kaulen Alexander Dahl	4 mi. SW of Ft. Valley, Ga.	48.15	688
3. <i>Goodyear</i>		United States	W. T. VanOrman W. W. Morton	¾ mi. north of Adrian, Ga.	50.53	685
4. <i>Lafayette</i>		France	Georges Blanchet Dr. Geo. M. LeGalle	2½ mi. east of Waverley Hall, Ga.	49.00	678
5. <i>Hispania</i>		Spain	Enrique Maldonado B. Molas	8 mi. east of Eutawville, S. C.	41.30	645
6. <i>Belgica</i>		Belgium	Ernest Demuyter M. DeSoete	13. mi. NW of Florence, S. C.	32.15	600
7. <i>Münster</i>		Germany	Ferdinand Eimersmacher Dr. Rudolph Predeck	Prosperity, S. C.	47.40	575
8. <i>Duc</i>		Italy	Domenico Leone Ugo Medori	5 mi. south of Whitmire, S. C.	30.25	570
9. <i>Paris-Bruxelles</i>		France	Maurice Bienaimé A. Veenstra	7 mi. south of Dunn, S. C.	25.20	552
10. <i>U. S. Army</i>		United States	W. E. Kepner Wm. O. Eareckson	York, S. C.	25.45	530
11. <i>Wallonie</i>		Belgium	P. Quersin M. Theis	5 mi. SE of Greenville, S. C.	26.45	530
12. <i>Rex</i>		Italy	Eraldo Ilari Giuseppe Paonessa	5 mi. south of Mooresboro, N. C.	25.20	500
13. <i>Helvetia III</i>		Switzerland	Ernest L. Maag	16 mi. NW of Statesville, N. C.	21.45	465
14. <i>Bee</i>		England	George E. Meager R. S. Booth	5 mi. NE of Clover, Va.	21.20	450
15. <i>Ernst Brandenburg</i>		Germany	Dr. A. Halben Hugo Kaulen, Jr.	Sugar Island, Putin-bay, Ohio	4.15	50

* Distance scaled by U. S. Geological Survey.

RECORDS. In connection with the competition for balloons several world's records were made in the United States during the year. For balloons of the third category, of the Fédération Aéronautique Internationale, namely with 901 to 1200 cubic meters capacity, E. J. Hill and A. G. Schlosser of the United States made a record for duration of 26 hours and 46 minutes in their flight from the Ford Airport to Montvale, Va. on July 4 and 5. In the same competition S. A. N. Rasmussen flying to Hookerton, N. C., made a distance record of 920.5 kilometers (572 miles). These two records were world's records as well as for America. They also held in the fourth category, namely for balloons for 1201-1600 cubic meters. In the fifth category of balloons of 1601-2200 cubic meters capacity, a world's duration record was made in the Gordon Bennett race by Georges Blanchet and Dr. George M. LeGalle, flying from Detroit to Waverly Hall, Ga., September 10 and 12, in 49 hours. In this same competition Hill and Schlosser, flying from Detroit to Baxley, made an American record of 47 hours and 55 minutes. However, Hill and Schlosser were able to make a world's record for distance of 1198.9 kilometers or 745 miles. In the sixth category which included balloons from 2201-3000 cubic meters the same records prevailed; while for altitude Captain Hawthorne C. Gray, U. S. A., who died later in the year, at Scott Field, Belleville, Ill., made a world's record of 8690 meters or 28,510 feet. These records also prevailed for the seventh category including balloons of 3001-4000 cubic meters, and the eighth category of balloons of 4001-5000 cubic meters.

On November 4, Captain Hawthorne C. Gray, U. S. A. Air Corps, reached a height of 42,470 feet, ascending in a free balloon at Scott Field, Belleville, Ill. While this was a height greater than any previously attained, it resulted fatally for Captain Gray, as he was found dead in the basket of his balloon in the trees near Sparta, Tenn. The oxygen tube was cut by a knife, and it was the decision of the official court of in-

quiry that while endeavoring to cut away surplus equipment so as to reach a higher altitude Captain Gray accidentally cut the tube. Later in the month the U. S. Bureau of Standards reported to the War Department that the calibration of the barograph carried in Captain Gray's balloon indicated that a height of 42,470 feet had been reached. This was the same height as was reached by Captain Gray on May 4, but in this ascent, as his balloon was descending too rapidly, he was forced to jump at 8000 feet, and consequently his record was not recognized by the Fédération Aéronautique Internationale. Previously on March 9, at Scott Field, Captain Gray had made an altitude record of 8690 meters (28,510 feet).

AIRSHIPS

During the year there were under construction in several countries large airships for commercial use and it was apparent that still further trials were to be made in this form of aerial navigation notwithstanding the previous mishaps and the opinion held in some quarters that the large dirigible could not be operated with the economy and safety required in commercial use. At Friedrichshafen, the German Zeppelin works were engaged in the construction of a large new craft known as the LZ-127, which was designed for experimental work in connection with the proposed German trans-Atlantic airship service. It was stated that the cubic capacity of this new Zeppelin was to be about 3,750,000 cubic feet as compared with 2,500,000 cubic feet for its predecessor the LZ-126 built for the United States and incorporated in its navy as the *Los Angeles*. Its capacity would be somewhat less than the 5,000,000 cubic feet of the *R-100*, described below. The LZ-127 was stated to be 775 feet in length, 100 feet at its greatest diameter, 110 feet in height, and would afford accommodation for 80 passengers and carry a crew of 26.

This notable airship was designed by Dr. Hugo Eckner, the head of the company. The

work on this ship had been seriously restricted through the limitations imposed by the Versailles Treaty, but in 1926 the Allied Commission had broadened these restrictions so that the plant was able to undertake new work and endeavor to regain its former preëminence in lighter-than-air construction. While no details for the new Zeppelin under construction in 1927 were announced, nevertheless there were many innovations, some of which it was believed might change the entire trend of airship design. The fuel to be used was a gas not greatly different from ordinary illuminating gas carried in gas cells placed below the ordinary hydrogen cells and used in the engines in place of liquid gasoline. Having the same specific gravity as air, this fuel gas would permit long trips to be made with little change in the weight of the fuel, whereas with gasoline the load is very heavy at the start and diminishes gradually during the voyage. The composition of this new gas was stated to be mainly althylene which was lighter than air and ordinarily would be a satisfactory gas for an internal combustion motor. This gas, however, was lighter than air and to overcome this there was said to be added an admixture of a small proportion of another fuel gas of heavier weight, probably butane or one of its numerous derivatives. Tests were in progress during the year to define the suitable proportion for the mixture, but it was believed that 90 per cent of althylene and about 10 per cent butane would be employed.

It was stated later in the year that Dr. Eckner planned to encircle the globe on a non-stop flight with the new Zeppelin. He planned his first long flight to the United States, proceeding without stopping to San Diego, and later to put the ship into commercial service between Europe and South America. Should the new Zeppelin prove the success anticipated it was probable that new airships would be constructed for trans-Atlantic service. Naturally, improvements in metallurgy and design had made possible changes in the gas powered airship. The Zeppelin's standard type of girder was improved and simplified while a new longitudinal girder was introduced dividing the interior of the ship into the upper and lower gas cells. The power of the new Zeppelin was to be increased by using engines of greater power and of a type permitted under the amended Treaty restrictions.

BRITISH EMPIRE AIRSHIPS. At the end of the year the *R-100*, the first of two airships of 5,000,000 cubic feet capacity ordered for British Empire use under construction at East Howden, had reached a point where its completion by the following April was anticipated. This ship was being built to a contract for £350,000 by the Airship Guarantee Company, and like a sister ship under construction at the Royal Airship Works at Cardington, was designed for a gross lift of 160 tons, a structure weight not exceeding 90 tons, and a speed of 70 miles an hour. In regard to these items it was claimed that the specifications actually had been improved upon so that a gross lift of 156 tons, a structure weight of only 83 tons, and top speed of 83 miles an hour, and a cruising speed of 75 miles an hour for 4500 miles in still air was secured with a full load of 100 passengers and their supplies. It was claimed by the designers that the factors of safety secured in the new airship were double those required by the Committee on

Airworthiness, and wind conditions in excess of any reasonably to be anticipated had been provided for. The *R-100* was constructed of duralumin, 709 feet in length with the greatest diameter of 130 feet and a transverse frame so spaced that no one gasbag between the frames would take more than 10 per cent of the total lift. Each of the gas bags, the largest of which have a capacity of 500,000 cubic feet, was enclosed in a net and anchored to a framework so as to prevent any bending strains being put upon the girders. In the bow where the mooring strains were centred the girders were uniform and reinforced, and at the centre the principal stresses to be met due to hogging are arranged with the lower girders stronger to resist compression than the upper girders. The passenger unit is suspended from the ship, not resting on any girder or frame and consists of two and four berth cabins, lounge, dining rooms, verandas, etc.; while there are three engine nacelles and the commander's control cabin, the latter being sunk through the underside of the vessel amidships. The engines are six Rolls-Royce Condor units of 700 horse power each and would use gasoline as fuel as the new engines designed to burn hydrogen and kerosene or crude oil were not to be available on the completion of the ship. It was believed that the *R-100* could make the trip from London to New York in 48 hours and operate profitably at an average fare of £100 per passenger. The ship was estimated to cost about £450,000.

U. S. NAVY AIRSHIPS. In the United States, the large airship *Los Angeles* was still in use, and under further tests and experiments to develop further information to be used in the construction of the new United States airships which had been provided for in the aviation programme of the previous year. The problems of landing and entering sheds were better understood, and the design for the 6,000,000-cu. ft. dirigibles was developed and preparations were being made to award contracts for one or both of the ships authorized by Congress. Proposals had been received for the construction of the hangar in which the new airships were to be built.

NOTABLE FLIGHTS

During the year 1927 a large number of notable flights were made under varying circumstances which served to demonstrate not only the progress in the development of aircraft, but also to indicate more than ever the possibility of long-distance communication. A number of these flights were remarkable not only for the distance traveled, but also for demonstrating international good-will and the ease with which communication could be maintained between distant nations.

Probably the most spectacular flight in the history of aviation was that of Captain Charles A. Lindbergh, a St. Louis Air Mail Pilot, who, leaving Roosevelt Field, New York, at 7.52 a.m. on Friday, May 20, made a non-stop trip to Paris, landing safely at Le Bourget Field at 5.21 p.m. New York daylight saving time, May 21, or 33½ hours for a passage of 3610 miles at an average speed of about 108 miles per hour.

Captain Lindbergh previously had flown from San Diego to St. Louis and from St. Louis to New York reaching Roosevelt Field May 12. Observing the weather conditions and considering

Underwood & Underwood

COLONEL CHARLES A. LINDBERGH
AMERICAN AVIATOR

the various meteorological reports he decided to start the flight just before midnight on Thursday, May 19, in spite of the heavy fog and slight rain. The weather reports indicated that the fog was lifting along the coast and at 2 A.M. when Captain Lindbergh made his final preparations the rain had stopped and at 7.52 A.M. on Friday, May 20, he took his departure. An hour later he was sighted over East Greenwich, R. I. and then over Halifax, N. S., and at several times in the afternoon over Nova Scotia. He was last seen at 6.15 when he passed St. Johns, Newfoundland, and headed over the Atlantic. Various wireless reports were made as Lindbergh approached the Irish coast and as he flew over Ireland his plane was observed at several points. At 8 P.M. French time he was over Bayeux, France, and a few minutes later over Cherbourg, and at 10.24 P.M. on Saturday, May 21, he landed amid great enthusiasm at Le Bourget Air Port. Over 100,000 people swarmed over the field and it was with difficulty that the aviator could make his exit and proceed to the American Embassy where he became the guest of Ambassador Herrick and procured much needed rest.

The plane in which Colonel Lindbergh made his flight was designed by Donald Hall, chief engineer of the Ryan Airlines, Inc., and was known as the *Ryan NY-P* before it was formally christened *The Spirit of St. Louis*. The plane had a span of 46 feet 10 inches, a chord of 7 feet, a length of 38 feet, and a wing area of 319 square feet. The cockpit was entirely enclosed, being placed to the rear of the fuel tanks for safety and balance. These fuel tanks obscured vision directly forward so that a periscope was used consisting of two 45° mirrors so mounted as to reflect the image on the instrument board directly in front of the pilot. This periscope could be extended on the left-hand side of the fuselage at about eye level or could be drawn in out of the way. Additional visibility was secured through windows at each side of the fuselage and by a skylight in the wing. An air scoop provided fresh air in the cockpit at all times. The fuselage was made of welded steel tubing without wires for bracing as a truss system was employed. The engine mounting was built separately of steel tubing and pinned to the fuselage proper by four nickel steel bolts above the gasoline compartment in the fuselage and the outboard struts attached the wings to the fuselage, the outboard struts being of steel with airfoil sections. The wings were of conventional fabric construction being built in one piece, suitably reinforced and covered with fabric and six coats of aluminum pigmented dope.

The engine used for this plane was the Wright "Whirlwind" J5C giving 223 h.p. at 1800 revolutions per minute, and there were gasoline tanks with an aggregate capacity of 450 gallons, one tank of 210 gallons capacity being mounted in the centre of the fuselage and another of 88 gallons in front of it in the engine mount. In the wing were three smaller tanks with a volume of 152 gallons; while to the rear of the engine acting as a fire wall was a 25-gallon oil tank. The engine and mounting were well cowled in, ending in a neat nose spinner on the standard steel propeller.

The instruments installed included an earth inductor compass, mounted aft of the cockpit with the controller convenient to the pilot's right hand and the indicator directly in front of

the pilot, a magnetic compass, an air speed indicator, a bank and turn indicator, a speed and drift meter, a speed timer (stop watch), a motorometer (heat indicator), an oil pressure gauge, ignition switch, an oil temperature gauge, and an anemometer developed by Lindbergh.

The fuselage of the airship was carefully designed and well streamlined so that wherever a longitudinal section was taken it would show smooth curves from the propeller spinner to the tail. The propeller was of duralumin set at 16½° pitch. *The Spirit of St. Louis* weighed complete with instruments 2150 pounds and carried a useful load of 3144 pounds distributed as follows:

	Pounds
Pilot	170
Gasoline—450 gallons	2,759
Oil—25 gallons	175
Miscellaneous	40
Total	3,144

Thus the gross weight fully loaded at the start of the flight was 5294 pounds. It was reported, however, that the total load of the plane on the take-off was 5150 pounds; while the gross weight lightly loaded at the end of the flight without gasoline and food, but with 10 gallons of oil left was 2415 pounds.

Lindbergh, after his notable reception in Paris, flew to Brussels, where he was similarly received by an enthusiastic populace and by the King and Queen, from whose hands he received decorations and other honors. Flying to London, he enjoyed a repetition of his triumphs, and was given an audience by King George and the Prince of Wales. On his return to France his machine was dismantled, and he sailed to Washington on the U. S. cruiser *Memphis*. He reached Washington on June 11, and there received the Distinguished Flying Cross from President Coolidge. Flying to New York on June 11, he was enthusiastically greeted, and a great public demonstration was held in his honor, in the course of which during a military parade he rode in an open car from the Battery to Central Park. On June 16, he was presented with the \$25,000 prize offered by Raymond Orteig for the first non-stop flight from New York to Paris.

On July 20 Colonel Lindbergh, for he had been promoted as a reserve officer, left New York under the auspices of the Daniel Guggenheim Fund for a tour of the United States in his airplane, *The Spirit of St. Louis*. This circuit was completed on October 23, the total distance of the tour being 20,350 miles, and the total time spent in the air 260 hours. During this tour Colonel Lindbergh, who was accompanied by a cabin monoplane belonging to the Department of Commerce, visited 23 State capitals, made a total number of 13 touch stops, and 69 long stops, at all of which he was enthusiastically greeted. Only on one occasion was he late when arriving at the designated point. He used the original engine that was in the plane during his New York-Paris flight. On November 14, Colonel Lindbergh received from the hands of President Coolidge the Hubbard Medal of the National Geographic Society, and on December 8 he received the Langley Medal of the Smithsonian Institution, an honor which had been previously awarded to Orville and Wilbur Wright, Glenn H. Curtiss, and Gustave Eiffel.

The interest which Colonel Lindbergh had aroused by his trans-Atlantic flight and later by his tour of the United States, was again stimulated when this self-possessed and enterprising aviator took off from Bolling Field, Washington, D. C., on December 13, in the *Spirit of St. Louis* for Mexico City, Mexico, a 2031-mile non-stop flight. This trip was made at the invitation of President Calles of Mexico, and as soon as announced it straightway aroused the greatest enthusiasm in Mexico. Lindbergh flew the distance in 27 hours, 10 minutes, or approximately six hours less than his flight from New York to Paris, and he carried a full load weighing 4750 pounds, including 368 gallons of gasoline and 15 gallons of oil. Colonel Lindbergh safely reached his destination, though the weather conditions were far from perfect, and much of the time he was forced to fly blind in addition to experiencing about 13½ hours of darkness.

After a triumphant reception in Mexico City, in the course of which Lindbergh was the recipient of official honors as well as general acclaim, he proceeded to Guatemala City, which he reached on December 29, and was received by President Chacon. On the following day he flew to Belize, the capital of British Honduras. This flight through Central America, which it was intended should be continued to the northern part of South America, did much to promote friendly relations between the Central American republics and the United States. Lindbergh continued his remarkable success as an ambassador of goodwill, and everywhere made warm friends for himself and his country; he was still on his way at the close of the year.

GOOD-WILL FLIGHT. The Good-will flight, to which reference was made in the YEAR BOOK of 1926, was started at Kelly Field, San Antonio, Texas, Dec. 21, 1926, and involved an 18,500-mile circuit of Central and South America by a group of five amphibian airplanes of the U. S. Army Air Corps, navigated by ten officers of that service.

Leaving the City of San Antonio, Tex., these aviators proceeded by stages southward down the east coast of Mexico, reaching Punta Arenas, Costa Rica, on January 16, and then passed down the coast, arriving at La Paz, Bolivia, February 14. The planes went as far as Valdivia, Chile, and then crossed the Andes, and on February 22 the group arrived at Bahia Blanca, Argentina. In their flight to Buenos Aires a mishap occurred February 26, in which Capt. C. F. Woolsey and Lieut. J. W. Benton were killed, in a collision between planes. This accident, however, did not interfere with the progress of the flight which, extending up the Paraná River, reached Asuncion, Paraguay, March 3. Next came Brazil, the Guianas and Venezuela, and by successive stages through the Caribbean sea and the islands of the lesser Antilles, Haiti, and Cuba, the fliers reached Washington, where on May 2, at Bolling Field, the tour was completed. The survivors, Maj. H. A. Dargue, Capt. A. L. McDaniel, Capt. Ira C. Baker, and First Lieuts. E. C. Whitehead, C. McK. Robinson, M. S. Fairchild, B. S. Thompson and E. D. Weddington, were greeted by the President and honored with the Distinguished Flying Cross.

Pinedo's Flight: A notable flight of the year was that of Col. Francesco de Pinedo, who left Ostia, Italy, in the airplane *Santa Maria II*

February 13, and flew to the Cape Verde Islands. On February 22, Colonel de Pinedo took off for South America, making the flight to the Island of Ferdinando do Moronha, Brazil, a distance of 1432 miles, in 12 hours. On February 26, he arrived at Rio de Janeiro and then flew to Asuncion, Paraguay, which he reached March 15. He then turned towards North America, and on March 29 arrived at New Orleans, after a flight from Havana. On April 6, while at Roosevelt Dam, Arizona, his plane was destroyed by fire in an accident, and he was forced to await the arrival of a new plane, which on May 8 was assembled and flown experimentally from New York to Boston. De Pinedo completed his tour of the North American continent, and departing from Trepassy, N. F., on May 23, he flew across the Atlantic. He was, however, forced to alight on the water near the Azores, to which he was towed, reaching Horta May 30. After repairs he proceeded, stopping at Lisbon and Barcelona, reaching Ostia at the mouth of the River Tiber on the afternoon of June 16, having completed a 25,000-mile aerial journey involving two flights across the Atlantic and flying over some of the wildest and unexplored regions of South America. The *Santa Maria* alighted on the sea in front of a float where Mussolini and other officials of Italy welcomed Colonel de Pinedo, his navigating officer, Captain Carlo Delprete, and the mechanic, Vitalo Zacchetti.

Following Colonel de Pinedo's flight, Maj. Sarmiento Beires of Portugal on March 17 flew across the Atlantic from the Bissagos archipelago of Portuguese Guinea to Fernando do Noronha, Brazil.

On April 26 Lieut. Com. Noel Davis, U. S. N., and Lieut. Stanley H. Wooster, who were trying out the airplane *American Legion*, intended for making a New York-Paris flight, were killed in a crash during a test trip at Langley Field, Virginia.

The list of tragedies involving aviators attempting to cross the Atlantic began May 6 when Captain St. Roman and Commander Mounceyres, in an airplane without pontoons, having reached a point 120 miles off Brazil in a flight from Senegal, Africa, to Buenos Aires, disappeared without a trace. The last wireless message gave their position as 120 miles east of the Brazilian coast.

Another tragedy occurred May 8, when Captain Charles Nungesser (q.v.) and François Coli, in the airplane *White Bird*, attempting to fly from Paris to New York, disappeared. The last news of them was that they were sighted passing over Ireland. A careful search was made in Newfoundland, but no traces were found.

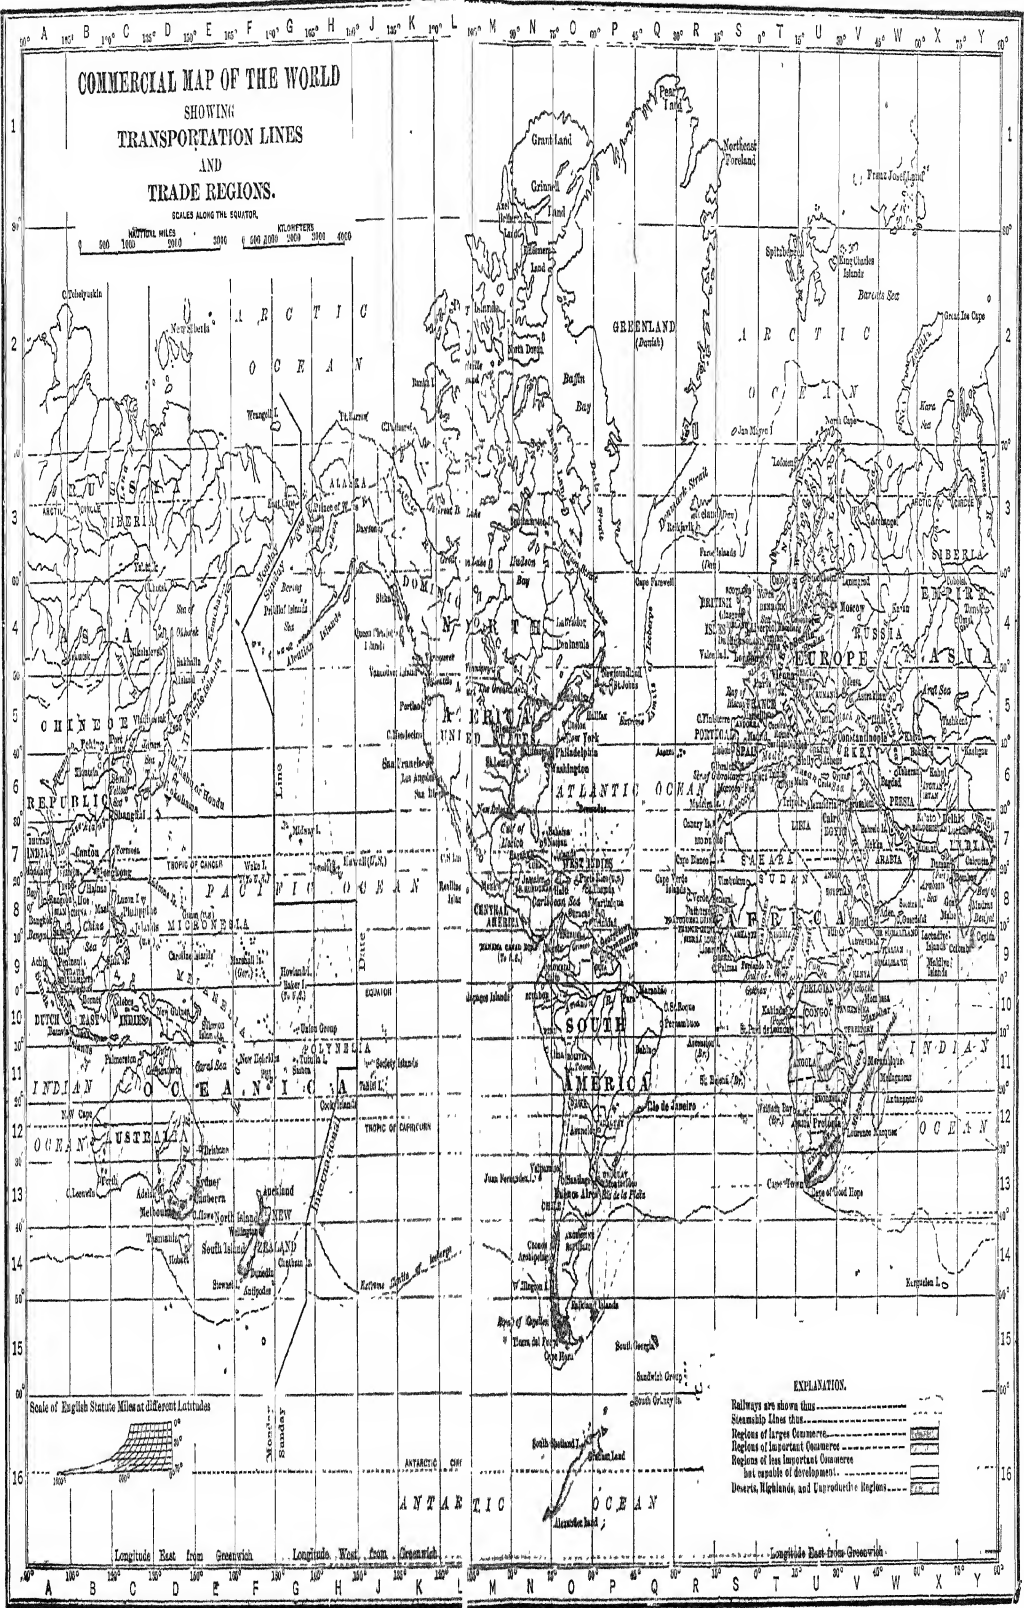

CHAMBERLIN'S TRANS-ATLANTIC FLIGHT. As if the accomplishment of Lindbergh were not enough, within a month a second American-built airplane, with an American born pilot, and for the first time carrying a passenger, made its way to the mainland of Europe, traveling 3905 miles in 43 hours. This plane was the Bollanca monoplane *Columbia*, piloted by Clarence D. Chamberlin, and carrying the passenger, Charles A. Levine, which previously, April 14, had made the world's endurance record, elsewhere discussed. This plane left Roosevelt Field, L. I., at 6:05 A.M., Saturday, June 4, and made its flight to Heilft, Germany, where a landing was made at 4:15 A.M., Monday, June 6, establishing a new world's non-stop distance record.

The landing was made at Helfta, near Eisleben, Saxony, on account of lack of gasoline and inability to know their location. Taking on gasoline, they proceeded to Kottbus, where they were forced again to the ground in a marsh, with a broken propeller. The damage repaired, they proceeded to Berlin. Chamberlin and Levine were the recipients of notable honors on their landing at the German capital, and at other European cities.

PACIFIC FLIGHTS. While aviators were busy over the Atlantic, Lieut. L. J. Maitland, U. S. A., and Lieut. A. F. Hegenberger, U. S. A., in the army transport C-2, a Fokker plane with three Wright Whirlwind engines flying from Oakland Airport, Cal., June 28, reached Wheeler Field, Island of Oahu, Hawaii, June 29, a distance of 2400 miles in 25 hours, 15 minutes. This was the first time that a trip by air had been made between the American continent and the Hawaiian Islands, and in addition a world record for distance flying over open water was made. On landing, the two officers received a notable welcome, and on their return to San Francisco, July 12, they were given official receptions, and July 21 the Assistant Secretary of War for Aeronautics, F. Trubee Davison, cited them for the Distinguished Flying Cross.

The transit of the Pacific, however, was not confined to army officers, for on July 14, Ernest L. Smith and Emory B. Bronte flew from San Francisco to Molokai, Hawaii, in a civilian monoplane, *City of Oakland*, a distance of 2348 miles, in 25½ hours. The plane was wrecked in a forced landing due to exhaustion of gasoline.

Previously, May 25, James D. Dole of San Francisco had announced awards of \$25,000 and \$10,000 for non-stop Pacific Coast-Hawaii flights, open to civilians and available August 1. The substantial prizes for this specific trip aroused general interest, and a number of civilian and other aviators announced their intention of competing, though the time of preparation, as was demonstrated later, was all too short. Even before the race two regrettable accidents occurred, resulting in fatalities. On August 10 Lieut. George W. D. Covell, U. S. N., and Lieut. R. S. Wagner, U. S. N., were killed at Point Loma, Cal., when their plane crashed as they were on their way to participate in "the Dole Derby," as the race became known. On August 12 Capt. Arthur V. Rogers, a British ace, also was killed at Los Angeles, during a test flight in preparation for the same event.

On August 16, the date arranged for the race, a number of planes left Oakland, Cal., and the Travelair monoplane *Woolaroo*, with Arthur C. Goebel as pilot and Lieut. W. N. Davis, U. S. N., as navigator, successfully made the journey in 26 hours, 17 minutes 33 seconds, and won the first prize of \$25,000. The second prize was won by the Breese monoplane *Aloha*, piloted by Martin Jensen with Paul Schuler as navigator, in 28 hours 16 minutes; these two planes alone completed the flight. Of the other entries, the plane *Miss Doran*, with Mildred Doran, John A. Pedlar and Lieut. V. R. Knope, and the *Golden Eagle*, with J. W. Frost and Gordon Scott, were both lost; while the plane *Dallas Spirit*, with W. P. Erwin and A. H. Eichealdt, which left in search of the missing craft August 19, also was not heard from.

COMMANDER BYRD'S FLIGHT. Returning to the Atlantic, record should be made of a notable

flight by Com. Richard E. Byrd, U. S. N., who flew from New York in a tri-motor Fokker monoplane, *The America*, accompanied by Bert Acosta, Lieut. George O. Noville, U. S. N., and Bernt Balchen, leaving Roosevelt Field, L. I., at 5.24 A.M. June 29. At 2.30 A.M. on July 1, this plane, after being in the air 43 hours and 21 minutes, was forced down at Ver-sur-Mer on the western coast of France 200 yards from the shore, in a persistent fog and rain. The descent was forced by exhaustion of the fuel supply. The plane, which weighed 17,261 pounds on starting, was badly damaged, but the records and the official mail were saved, the aviators making their way ashore by means of a rubber life raft. The major object of this flight was to obtain scientific data looking towards regular trans-Atlantic aviation, and while the aviators were unable to make their landing in Paris as they anticipated, the technical results obtained fully warranted the attempt. Commander Byrd and his companions received official and other honors in Paris, and on July 12 they sailed from France to New York, being joined at Southampton by Clarence D. Chamberlin. The five received a notable welcome in New York city on their arrival July 18. On the following day Commander Byrd and Lieutenant Noville were decorated by Secretary of the Navy Wilbur with the U. S. Navy Distinguished Flying Cross.

A misfortune that occurred on or about August 25 was when an American aviator, Paul Redford, took off from Glynn Isle Beach, Brunswick, Ga., in the plane, *Spirit of Brunswick*, in an attempt to make a 4600-mile non-stop flight to Rio de Janeiro, Brazil. He was sighted by a north-bound steamer on his first night, flying over open water, but from that time no trace of plane or flyer was found. He carried in the plane a load of 518 gallons of gasoline, which would have enabled him to stay aloft for about 52 hours if everything had gone well. He planned to arrive in Rio de Janeiro August 27 at about 2.30 P.M.

During the spring and summer the question of a flight from Europe to America was further discussed, notwithstanding the fate of Nungesser and Coli. On August 14 the two Junker all-metal monoplanes, *Bremen* and *Europa*, left Dessau, Germany, on a western passage, but both failed, the *Europa* being forced down in a fog and the *Bremen*, encountering head winds and storms off Ireland, returning to its place of departure.

On August 31 a Fokker Jupiter airplane *St. Raphael*, carrying Princess Anne Löwenstein-Wertheim and Capt. Leslie Hamilton and Lieut.-Col. Frederick F. Minchin, leaving Upavon, England, for Ottawa, Canada, was lost. Nothing was heard of the plane after it left the Irish coast.

Another accident occurred September 8, when the plane *Old Glory*, with Lloyd Bertaud, James DeWitt Hill, and Philip A. Payne left Old Orchard Beach, Me., on a projected flight to Rome, Italy. Nothing positive was heard of the airplane after a call of SOS was picked up by the steamships *Carmania* and *Lapland*. On the same day two Canadians, Capt. T. B. Tully and Lieut. James V. Metcalf, who had come from London, Ontario, flew from Harbor Grace, N. F. V., in the plane *Sir John Carling* on a proposed non-stop flight to London, England. Apparently the beginning of the flight was successful, but no trace was later found of the plane and its aviators.

SCHLEE AND BROOK. An interesting flight in an attempted trip around the world was made by Edward F. Schlee and William S. Brock in the Stinson-Detroit monoplane *Pride of Detroit*. It ended at Tokio, Japan, September 14, when they gave up their original intention to cross the Pacific, lacking fuel supplies at the Midway Islands. These aviators, who had departed from Detroit, flew from Harbor Grace, N. F., August 28, landing at Croydon Aerodrome, England. They continued their progress in an easterly direction, stopping first at Munich and then at 14 other cities en route, and making 12,295 miles in 145 hours of flight during 18 days. They were engaged in an effort to beat the world's record of 28 days for the aerial circumnavigation of the globe, and without extraordinary or government preparation had carried on their trip in an efficient and earnest manner. On account of the many accidents that had taken place on trans-oceanic flights, they were persuaded to give up their flight across the Pacific from Japan and to ship their plane home by steamship.

On October 11 Ruth Elder and George Halde-man flew from New York in a single-motored monoplane, *The American Girl*, for Paris, the former being anxious to gain the record of being the first woman to cross the Atlantic in an airplane. Owing to a broken oil connection developing, after a distance of 2000 miles had been accomplished, the plane was forced down, and Miss Elder and her companion were picked up by a Dutch steamer off the Azores. The plane was a total wreck, but the two aviators continued their journey to Europe where they were honored in several capitals.

Still another disaster occurred when Mrs. Frances W. Grayson and her pilot, Bruce Goldsborough, leaving Roosevelt Field, N. Y., in the Sikorsky plane *Dawn*, December 23, bound for Harbor Grace, N. F., disappeared entirely. They were last seen over Cape Cod, two hours after they took off. Notwithstanding a search by the U. S. Navy dirigible *Los Angeles* and the destroyers *Mahan* and *Sturtevant*, carried on by order of the U. S. Navy Department, no trace of the plane was found.

Another important trans-Atlantic and extended flight commenced October 10. Dieudonne Costes and Joseph Le Brix took off from Le Bourget airport, Paris, for St. Louis, Senegal, about 2700 miles distant, which they reached in 25 hours, 17 minutes. On October 14 they proceeded to Port Natal, Brazil, whence, after stopping a day, they set out for Rio de Janeiro. They flew in a Breguet plane, named *Nungesser-Coll*, with a 500-h.p. Hispano-Suiza water-cooled engine. It was the Breguet plane that was used to make the two long-distance records from Paris to Omsk, Siberia, and from Paris to Djisk, Persia, in the previous year, distances of 3350 miles and 2580 miles, respectively, being covered. The plane was recovered, inspected and reequipped for the trip, and functioned successfully not only in the trip across the Atlantic, but in subsequent flights of these aviators in South America. Costes and Le Brix remained the rest of the year in South America, and did considerable flying.

AVIATION COMPETITIONS

SCHNEIDER TROPHY RACE. This important competition for seaplanes was held September 26

off the Lido, Venice, Italy, over a course of 50 kilometers and a total distance of seven laps, or 350 kilometers. The race was held in Italy because Maj. Mario de Bernardi, Italy's representative, won the competition at Norfolk, Va., in 1926. (See the 1926 NEW INTERNATIONAL YEAR BOOK.)

The race was won by Flight Lieut. S. N. Webster, R. A. F., for Great Britain, flying in a Super Marine S-5 Napier monoplane with a geared-down Napier Lion racing engine. Lieut. Webster flew the 350 kilometers (211.483 miles) in 46 minutes and 20.08 seconds, or an average speed of 453.282 kilometers per hour (281.655 miles per hour). Second place was also won for Great Britain by Flight Lieut. O. F. Worsley, flying another Super Marine S-5 Napier machine fitted with a direct-drive Napier Lion engine, in 47 minutes, 46.75 seconds, with an average speed of 439.472 kilometers per hour (273.073 miles per hour). These two British machines were the only ones of a field of six starters that were able to finish, and the winners' average speed may be compared with the previous record of 246.496 miles per hour established in 1926.

Of the four other contestants in 1927, Major de Bernardi, who flew in a Macchi plane equipped with a Fiat 12-cylinder engine, was forced out on the second lap, while Capt. Arturo Ferrarin, the other Italian representative, also in a Macchi plane, ruptured a piston and experienced backfire on the first lap and was compelled to drop out soon after crossing the starting line. Flight Lieut. S. M. Kinkhead of England, in a Gloster IV plane fitted with a Napier Lion engine, after flying very fast, dropped out on the sixth lap, owing to his propeller spinner starting to burst; while Captain Guazzetti of Italy, in a Macchi machine, almost completed the sixth lap, but was compelled to retire by irregular fuel supply.

The Jacques Schneider Cup had been won once by France, three times by Italy, twice by the United States, and once by England, the 1927 victory making England's second success. It was stated in connection with this competition that the average speed of the race had increased from 1921 at an approximate rate of 30 miles per hour per year. The United States was not represented in the 1927 competition, as the most available plane, the Kirkham racing plane, with a 1200-h.p. Packard X engine, of Lieut. A. J. Williams, U. S. N., could not be conditioned in time to be sent to Europe. In connection with this race it was proposed after the competition in Italy to make it a biennial event, on the ground that the preparations involved in developing one or more planes were so elaborate as to make it almost impossible for a team to be developed each year. However, no definite decision had been reached in this matter at the end of the year.

NATIONAL AIR RACES, 1927. This important American competition was held at Felt's Field, Spokane, Wash., September 19-25, and was one of the most successful meetings of the kind ever held in the United States, both financially and from the standpoint of performance. There were no accidents of any consequence, and the races paid their own way, the gate receipts and other revenues amounting to about \$114,068, and the total expenses being estimated at \$113,106, in which amount were included sor-

Underwood & Underwood

AMERICAN AVIATORS OF 1927

GROUP OF FAMOUS TRANS-OCEANIC FLIERS RECEIVED AT THE WHITE HOUSE, NOVEMBER 14, 1927
 LEFT TO RIGHT: LIEUTENANT LESTER J. MAITLAND, U.S.A., CLARENCE D. CHAMBERLIN, ARTHUR C. GOEBEL, CHARLES A. LINDERBERGH,
 MISS RUTH ELDER, PAUL SCHLUTER, EMORY B. BRONSTE, LIEUTENANT A. F. HEGENBERGER, U.S.A., COMMANDER RICHARD E. BYRD, U.S.N.,
 GEORGE HALDEMAN, CHARLES A. LEVINE, BERNHARD BALOHEN, AND WILLIAM S. BROCK

\$47,251 for prize money and \$19,411 for trophies and other expenses. The guarantee of \$60,000 advanced by business men of Spokane was returned.

A non-stop race from New York to Spokane was scheduled in connection with the National Air Races, but was not successful. Three pilots were on hand the day of the start, but there were only two actual starters. Eddie Stinson, accompanied by Fred Koehler in a Stinson-Detroit monoplane with a Wright Whirlwind engine, made the better performance, landing at Missoula, Mont., while C. A. Schiller and Edward Bohn, in a plane of similar type, were forced down at Billings, Mont.

The meet opened with the National Air Derby, race for civilian planes, from Roosevelt Field, L. I., to the Spokane airport, in two classes. The race in Class A, with fifteen planes starting September 20, was won by a Laird biplane, with right Whirlwind engine, entered by the National Lead Battery Company. It was piloted by W. Holman, and won in the elapsed time of 19 hours, 42 minutes 47 seconds. Second place was taken by a Laird plane, piloted by E. Ballough in 20 hours, 18 minutes and 1 second, and third was won by a Buhl Airer plane, piloted by N. B. Mamer, with an elapsed time of 20 hours, 59 minutes and 13 seconds. There were eight entries that flew the distance, a number of others being withdrawn failing to start. The first prize in this competition was \$10,000. In class B, with 25 planes starting September 19, the first prize of \$5,000 was won by a Waco airplane piloted by C. W. Meyers, with an elapsed time of 30 hours, 23 minutes and 15 seconds; second prize was won by an Eaglerock plane, piloted by Leslie C. Meyers, in 30 hours, 47 minutes and 3 seconds; and third by an Eaglerock plane, piloted by J. S. Charles, in 31 hours, 48 minutes and 37 seconds. Nine of the entries completed the course, numerous others failing to start or being withdrawn.

The Pacific Coast Air Derby was for a flight from Mills Municipal Field, San Francisco, Cal., to the Spokane Airport. In class A the Travel Air airplane, piloted by H. C. Lippiatt, won with an elapsed time of 8 hours, 16 minutes and 17 seconds; the International biplane, piloted by Lee Schoenhair, was second with 8 hours, 40 minutes and 35 seconds; and the Breese monoplane, piloted by Vance Breese, was third with 10 hours, 5 minutes and 24 seconds. There were five entries in this class, for which the first prize was \$1500. For Class B of the Pacific Coast Air Derby six out of eight entries started and four finished, the winner, who received a prize of \$1000, being C. L. Langdon, in the International airplane, with 9 hours, 59 minutes and 18 seconds. Second place was taken by the Travel Air airplane, piloted by D. C. Warren, in 10 hours, 18 minutes, 14 seconds, and third place by the Eaglerock airplane piloted by Lee Willey, in 10 hours, 27 minutes, 28 seconds.

After these preliminary distance flights, the first event of the National Air Race was for the *Aero Digest* Trophy, to be competed for by civilians flying sport planes over a course of 60 miles. The first prize of \$500 was won by E. B. Heath, with a speed of 74.43 miles per hour, three other entries withdrawing.

Next came a civilian competition for light commercial planes, for prizes offered by the

Aviation Town and Country Club of Detroit, in which both speed and efficiency featured. The first prize for speed of \$500 was won by James Ray in a Pittcairn airplane, who made a speed of 138.394 miles per hour and ranked third in the efficiency competition with a score of 33.074. First place in the efficiency competition, carrying with it \$900, was taken by John H. Miller in a Hamilton Metal Company airplane, with a score of 528.400. There were ten competitors in this race, while one did not finish and six entries did not start.

The Western Flying Trophy Competition, a free-for-all race for two or more place low-powered airplanes for civilians only, brought out ten starters, and the first prize of \$1000 was won by Eugene Detmu in a Travel Air airplane, with a speed of 102.55 miles over the eight 10-mile laps.

The only starter in the *Dayton Daily News* light airplane trophy competition for civilians was E. B. Heath, who flew in a Heath Parasol airplane, making a speed of 73.417 miles per hour for the 30 miles and taking the first prize of \$500.

A military competition for the Liberty Engine Builders' Trophy, for observation type, two-place airplanes flown over a course of 100 miles, with individual trophy awards to the first four winners, was won by Lieut. H. A. Johnson in a Curtiss Falcon XO-13A airplane with Curtiss V-150 engine, who made an average speed of 170.156 miles per hour. In this competition each plane was required to carry a contest load based on engine displacement, and in addition 340 pounds of crew weight.

Another military competition was the Packard Motor Car Company trophy race for large-capacity airplanes, in which individual trophy awards were given to the first, second, third and fourth place winners. Lieut. H. W. Beaton, in a Fokker C-2 airplane, took first place with a speed of 115.198 miles per hour.

The race for pursuit type army planes, with individual trophy awards to the first four place winners, was won by Lieut. W. L. Cornelius in a Curtiss P-1-B airplane, with a speed of 158.412 miles per hour.

The Seattle Chamber of Commerce free-for-all race for two-, three- or four-place airplanes, was restricted to civilians and carried a first prize of \$1000. It was won by James Ray, in a Pittcairn airplane, with a speed of 136.145 miles per hour, flying one lap at a speed in excess of 141 miles per hour. Twelve planes finished, the number including all actual starters. This competition was over a course of 80 miles, or 10 laps.

The *Aero Digest* National Guard Trophy speed race for National Guard pilots and planes was won by Capt. Tom Simons in a Douglass O-2 plane, with a speed of 110.834 miles per hour, there being four starters, of which one was ruled out for fouling the pylon.

Three civilian airplanes started in the *Detroit News* Air Transport Trophy speed and efficiency race. First place for speed, with a prize of \$750, was won by Frank M. Hawkes in a Ryan airplane, making 104.837 miles per hour. Second place for speed was won by Jack Frye in a Fokker plane, with 100.085 miles per hour, and third place by John H. Miller, in a Hamilton plane, with 96.080 miles per hour. When it came to efficiency this order was re-

versed, Miller ranking first with 925.587, Frye second with 918.727, and Hawkes third with 905.011.

The Spokane *Spokesman-Review* offered a set of trophies for a free-for-all military pursuit-ship race, which was won by Lieut. Eugene C. Batten with a Curtiss XP-6A (Curtiss Hawk) airplane equipped with a Curtiss V-1550 engine and with wing radiators. This plane made the remarkable speed of 201.239 miles per hour, winning from Lieut. A. J. Lyon, whose Curtiss Hawk plane had a tunnel radiator under its nose, but used a similar engine. Lieutenant Lyon's speed was 189.608 miles per hour. There were ten starters in this race, all but nine finishing, one being ruled out for cutting a pylon in his circuit.

In the closed event for Naval and Marine Corps planes known as the Alexander Pantages Trophy race for pursuit-type navy planes, there were five entries, first place being taken by Lieut. T. P. Jetter in a Boeing F. B.-type plane, with a speed of 177.040 miles per hour.

FORD RELIABILITY TOUR. The third Ford reliability tour started at Detroit, June 27, and ended at that city July 12. Fourteen planes took off for the 3800-mile journey, which included 25 sections and involved stops at Buffalo, Geneva, Schenectady, Boston, Hartford, New York, Philadelphia, Baltimore, Pittsburgh, Cleveland, Kalamazoo, Dayton, Columbus, Cincinnati, Louisville, Memphis, Pine Bluff, Dallas, Oklahoma City, Tulsa, Wichita, Omaha, Moline, Hammond, Grand Rapids and Detroit. Of the planes which started, one was withdrawn for personal reasons, another, although completing the tour, was so seriously delayed by engine troubles that it was disqualified, while twelve planes finished in a satisfactory condition. The tour was won by Eddie Stinson, who flew in a Stinson-Detroit monoplane with a single Wright Whirlwind engine, with a point score of 9853.7. Second place was taken by Randolph Page, in a Hamilton monoplane, also with a single Wright Whirlwind engine, with a total of 7863.5 points; and third place was won by Harvey C. Mummert in a Mercury biplane with a Curtiss C-6A engine. Previous to the tour, tests of landing and take-off speeds and high speeds with contest loads were made to determine the "merit factor" of each plane. The formula used to decide the tour provided that the winner was to be the airplane carrying the greatest load with the least horse power at the highest speed plus the ability to get off the ground quickly and to stop in the shortest distance when landing. The Ford tour indicated further improvement in the construction and operation of planes and demonstrated the relative merits of both planes and engines when handled by experienced pilots.

AIRPLANE RECORDS. During 1927 a number of important records were made by airplanes, which served to indicate distinct progress in the development of the airplane and its engines as well as in skill of the pilots. In addition to the notable trans-Atlantic and trans-Pacific flights already referred to, the United States obtained at least its share of the records of the year. In Class C for airplanes returning to the point of departure without fueling, a world's record for duration was made by the German aviators, Cornelius Dillard and Johann Risties, flying in a Junkers W-33 plane, with a Junkers L-5 engine of 230 h.p., at Dessau, August 3-5, when

they spent 52 hours, 22 minutes, and 31 seconds in flight. In this trip they also made the world's record for distance, namely of 4660.02 kilometers, or 2895.07 miles. The world's record for duration thus supplanted, and the American record, had been made at Roosevelt Field, L. I., April 12-14, when Clarence D. Chamberlin and B. B. Acosta, in a Bellanca monoplane with a Wright Whirlwind J-5, 200-h.p. engine, were in the air 51 hours, 11 minutes, and 25 seconds. Chamberlin also made a world's record for air-line distance when on June 4 he started in his Wright-Bellanca plane, with a Wright J-5 200-h.p. engine, flying to Esleben, Germany, making a distance of 6294 kilometers, or 3911 miles, as referred to elsewhere.

During the year the world's altitude record was claimed by a French aviator, Jean Gallizo, but an investigation revealed fraud on the aviator's part, so that the record was supplanted by that of Lieut. C. C. Champion, U. S. N., who on July 25, 1927, had made a record of 11,727 meters, or 38,474 feet, flying in a Wright Apache plane with a Pratt & Whitney Wasp super-charged 425-h.p. engine. Lieutenant Champion, it may be stated, also had previously made a world's record for seaplanes, rising on July 4, 1927, at Washington to a height of 11,581 meters (37,995 feet), these records, of course, being American records as well as world's records.

It was stated that the world's altitude record was broken December 23, at Turin, Italy, by Renato Donati for whom an ascent of 38,792 feet was claimed.

On March 21-22 the world's records for duration and distance for airplanes with useful load of 500 kilograms (1102.3 pounds)—that is, pay load or ballast, exclusive of pilot, gasoline and oil—returning to point of departure, were made by the German aviators W. K. Schnabele and Fritz Loose, in a Junkers W-35 plane with a Junkers L-5 engine of 320 h.p., at Dessau. The world's duration record thus made was 22 hours, 11 minutes, and 45 seconds, and a distance record of 2735.588 kilometers (1690.81 miles). With the same amount of useful load, a world's record for 2000 kilograms was made by the German aviator, H. Steindorff, in a Rohrbach-Roland plane with 3 B. M. W. 230-h.p. engines, at Staaken, July 31, 1927, amounting to 205.407 kilometers per hour, or 127.632 miles per hour. In this same flight Steindorff, who flew 2315.338 kilometers (1438.680 miles), made a distance record with a useful load of 1000 kilograms, and a speed record of 214.855 kilometers per hour (133.504 miles), and a speed record for 2000 kilograms of 205.407 kilometers per hour (127.632 miles).

The world's duration record for an airplane with a useful load of 1000 kilograms (2204.12 pounds), was also made by a German aviator, Fritz Horn, in a Junkers G-24 plane with three Junkers L-11 engines of 230 h.p. each, at Dessau, April 4. With the same load, Steindorff, in the plane mentioned above, at Staaken on August 12, made a world's record for altitude of 6805 meters, or 22,326 feet.

The speed record for 500 kilograms for airplanes with a useful load of 1000 kilograms was made by the Czechoslovakian aviator, A. Jesek, in a Letov S-16 plane with a Hispano-Suiza engine of 450 h.p., flying from Prague, October 13. His speed was 230.929 kilometers per hour (143.492 miles). With an even heavier load,

namely of 2000 kilograms, or 4409.24 pounds, the record for duration was broken by J. Ristetics, a German aviator, in a Junkers G-24 plane with three Junkers 280-h.p. engines, at Dessau, June 29, his time in the air being 13 hours, 1 minute, 12.8 seconds. With a similar load, Herman Steindorff, in a Rohrbach-Roland plane with 3 B. M. W. engines of 230 h.p., each, flew a distance of 1750.469 kilometers (1087.68 miles), at Staaken, July 31.

The altitude record for an airplane with a useful load of 2000 kilograms was made by an Italian, Domenico Antonini, at Cascina, Malpensa, May 26, when, flying in a Caproni C. A.-73 plane with two Isotta-Fraschini engines of 500 h.p. each he reached a height of 6262 meters (20,544 feet). With a useful load of 2000 kilograms, Steindorff, on July 28 made speed records for 500 and 1000 kilometers, at Staaken, of 215.378 kilometers per hour (133.828 miles), and 214.855 kilometers per hour (133.504 miles).

In contrast to the foregoing records, a number of world's records for light airplanes were also made during the year. In the first category, Class C, for two-seaters weighing empty less than 400 kilograms, Finat and Labric of France, flying in a closed circuit in a Candron-109 with a Salmson 40-h.p. engine, at Le Bourget, Oct. 20, made a world's record for a distance of 1146.834 kilometers (712.08 miles). On October 22, Monsieur and Madame Finat, in the same plane, flying from Le Bourget to Tempelhof Field, Berlin, flew 858.0 kilometers (539.3 miles), making a world's record for air-line distance. The world's record for altitude for this category of plane was achieved October 9, by the German aviators, Joseph Bohme and Reinhold Lofmk, in a Baumer B. L. V. DI-158 with a Wright L-4 engine of 60 h.p., at Hamburg, when a height of 5080 meters (15,630 feet) was recorded. The speed record for this class also went to Germany, Paul W. Baumer and F. Puls Baumer making a speed of 191.959 kilometers per hour (119.276 miles), on July 10 in a flight from Hamburg to Faulsbuttel.

In the second category of light airplanes, including single-seaters which weighed empty less than 200 kilograms, the world's record for distance in a closed circuit was made by the Hungarian, Charles Kaszala, flying in a Lanipich monoplane with a Thorotzkai engine of 18 h.p., at Budapest, September 14. He achieved a distance of 650 kilometers (403.9 miles). In the third category of light airplanes, Class C, including single-seaters that weighed empty from 200 to 300 kilograms, inclusive, Max Knipping of France, flying in a Candron-109 with a Salmson 40-h.p. engine at Le Bourget, October 26, flew 1581.840 kilometers (983.304 miles) in a closed circuit. Knipping also achieved the world's air-line distance for this class, flying October 30, from Le Bourget to Königsberg, Germany, a distance of 1400.8 kilometers (870.3 miles). The altitude record in this class was won by the German aviator Paul W. Baumer, in a Baumer airplane with a Wright 60-h.p. engine, rising from Hamburg, July 8, to a height of 6782 meters (22,250 feet). The speed record for light airplanes of the third category was made August 24 by the British aviator, Capt. H. S. Broad, in a D. H. Tiger Moth plane with a D. H.-32 engine of 130 h.p., at Stag Lane.

The year 1927 was notable for important records being made by seaplanes, the first of

these being that for distance made by Lieuts. B. J. Connell and H. C. Rodd, U. S. N., flying in the P. N.-10 with two Packard 600-h.p. engines at San Diego, Cal., August 16 and 17, when they made a world's and American record for distance flying of 2525 kilometers (1569 miles), returning to the point of departure without refueling.

The world's and American record for altitude already mentioned were made by Lieut. C. C. Champion, U. S. N., in a Wright Apache plane with Pratt & Whitney Wasp supercharged 425-h.p. engine, at Anacostia, D. C., July 4, when 11,581 meters (37,995 feet) were attained. Later in the year the Fédération Aéronautique Internationale awarded to Lieutenant Champion the world's record for altitude of 38,474 feet, made July 25. The maximum speed record for seaplanes, also mentioned above, was made by Maj. Mario de Bernardi in a Macchi M-52 plane with a Fiat-51 engine at the Lido, Venice, Italy, November 4. It was 479.290 kilometers per hour (297.816 miles). In unofficial trials this speed was bettered. The speed record for 100 kilometers by seaplane was made by Lieutenant Webster of the British Royal Air Force in a Super Marine S-5 with a Napier 1000-h.p. engine, in the Schneider trophy competition at Venice, September 26. It was 456.522 kilometers per hour (283.669 miles).

The world's seaplane record for 1000 kilometers came to the United States, being achieved by Lieut. Rutledge Irvine, U. S. N., in a Vought Corsair plane with a Pratt & Whitney Wasp 425-h.p. engine, on May 21, over the short closed course of 25-km. circuit at Hampton Roads, Va.; a speed of 210.716 kilometers per hour (130.932 miles), was achieved. This involved making 119 turns, and beat the world's record by over 27 miles per hour. The speed record for 2000 kilometers went to Switzerland, where Richard Wagner and George Zinsmaier, in a Dornier Merkur plane with a B. M. W. 500-600-h.p. engine, at Altenheim, August 10, accomplished 172 kilometers per hour (106.87 miles). The American speed record for 2000 kilometers was made by Lieuts. B. J. Connell and H. C. Rodd, U. S. N., at San Diego, Cal., August 15-16, in a P. N.-10 plane with two Packard engines of 600 h.p. each, at a speed of 126.597 kilometers per hour (78.644 miles).

Seaplanes flying with a useful load of 500 kilograms (1002.31 pounds), and returning to the point of departure, also scored new records in 1927. Lieutenants Connell and Rodd, in the flight referred to above, also made a world's and American duration record of 20 hours, 45 minutes, and 40 seconds, and a distance record of 2525 kilometers (1569 miles). A seaplane altitude record, with 500 kilograms useful load, was made by Lieut. George R. Henderson, U. S. N., in a Vought Corsair observation plane with a Pratt & Whitney Wasp engine of 425 h.p., at Washington, D. C., April 14, when he achieved 6760 meters (22,178 feet). Likewise, a world's speed record for 100 kilometers under similar conditions came to the United States when Lieut. S. W. Calloway, U. S. N., in a similar plane at Hampton Roads, April 23, made 236.998 kilometers per hour (147.263 miles). For 500 kilometers with a useful load of 500 kilograms Lieut. J. D. Barber, U. S. N., in a Vought Corsair plane with a Pratt & Whitney Wasp engine of 425 h.p., at Hampton Roads, Va.,

made a world's record of 218.90 kilometers per hour (136.023 miles), on April 30.

Under similar conditions the world's record speed for 1000 kilometers was made at Dessau, May 11, by the German aviator, George Juterbock, in a Junkers W-34 plane with a Bristol Jupiter engine of 420 h.p., who achieved 181.447 kilometers per hour (112.695 miles). An American record for this distance was made at San Diego, Cal., July 8, by Lieuts. B. J. Connell and S. R. Pope, U. S. N., in a P. N.-10 plane with two Packard engines of 600 h.p. each, and was 142.74 kilometers per hour (88.69 miles).

The world's record for duration, for seaplanes with a useful load of 1000 kilograms (220.462 pounds), returning to point of departure, came to the United States for the flight made on July 8 by Lieutenants Connell and Pope, referred to above. It was 11 hours, 7 minutes and 18 seconds. The distance record under these conditions was made by the Swiss aviators Wagner and Zinsmeyer, in their flight of August 8, and was 1600 kilometers (994.19 miles). The American distance record was made by Lieutenants Connell and Pope on their July 8 flight, and was 1525.189 kilometers (947.705 miles). The altitude record with a useful load of 1000 kilograms went to Switzerland, Richard Wagner in his Dornier Merkur plane with a B.M.W. 500-600-h.p. engine, at Altenheim, July 8, accomplishing 5851 meters (19,196 feet). The world's speed record for 100 kilometers under these conditions went to J. Ristetics, the German aviator, who flew June 1, at Dessau in a Junkers W-34 plane with a Jupiter 420-h.p. engine, and accomplished 196.078 kilometers per hour (121.836 miles). The American record for 100 kilometers, as well as for 500 and 1000, was made by Lieutenants Connell and Pope at San Diego, Cal., July 8, in the flight already noted. For 100 kilometers, it was 148.92 kilometers per hour (92.53 miles), for 500 kilometers, 145.68 kilometers per hour (90.52 miles); for 1000 kilometers, 142.74 kilometers per hour (88.69 miles). The world's record for speed for a seaplane with a useful load of 1000 kilograms for a distance of 1000 kilometers was accomplished by Wagner and Zinsmeyer in their flight of August 8, mentioned above, and was 175.0 kilometers per hour (109.11 miles). For a seaplane with a useful load of 2000 kilograms (4409.24 pounds), returning to the point of departure, world's records for duration and distance were made by Lieutenants Connell and Pope in their flight of July 8. The duration achieved on this occasion was 11 hours, 7 minutes, and 18 seconds, and the distance 1525.189 kilometers (947.705 miles).

The altitude record for a seaplane with 2000 kilograms was made at San Raphael, France, by Lieutenant de Vaisseau with a Paris C.A.M.A. plane with two Jupiter-Gnome engines of 480 h.p. each, on August 18, and was 4684 meters (15,368 feet). The American altitude record was made by Lieutenants Connell and Rodd, U. S. N., in a P. N. plane with two Packard 600-h.p. engines at San Diego, Cal., August 18, and was 2008 meters (6588 feet). The world's record for speed for 100 kilometers went in 1927 to Switzerland, being taken by Richard Wagner in his Dornier Merkur plane with a B.M.W. 500-600-h.p. engine, at Altenheim, July 18, and was 190.435 kilometers per hour (119.112 miles). Lieutenants Connell and Pope, in their flight

on July 8, made the American speed record for 100 kilometers of 148.92 kilometers per hour (92.53 miles). For 500 kilometers they also made an American record of 145.68 kilometers (90.52 miles) per hour, and for 1000 kilometers, 142.74 kilometers per hour (88.69 miles).

The United States Navy aviators, Lieutenants Connell and Rodd, in the flight on August 18, achieved a world's record for the greatest payload carried to an altitude of 2000 meters (6551.7 feet) when in a P.N.-10 plane with two Packard 600-h.p. engines, at San Diego, Cal., on August 18, they carried 3504 kilograms (7726 pounds).

ENGINES. Possibly the most significant item in aviation in 1927 was the development of the air-cooled engine of large horse power. This was employed in new aircraft built for various purposes, and by the reduction of the unit weight of engine secured greater efficiency and power. Large engines of this type were built both for military and naval planes and extensively for commercial aircraft as used in mail and passenger flying. The Wright Whirlwind motor used by the various trans-Atlantic and other fliers was an air-cooled radial engine. It was used by Lindbergh, Chamberlin, Byrd, Maitland, Smith, Goebel, Jensen, and Black in flights already mentioned. These engines resulted from experiments initiated as early as 1916 by Charles L. Lawrance, and from 1920 to 1927 seven successive models of air-cooled engines were developed which underwent practical tests and service in the United States Army and Navy Air Service.

In 1927 it was estimated that some 540 commercial airplane engines, all of which were of the air-cooled type and most of which were over 100 horse power, were built in the United States. One of the most interesting of the engines of the year was the 400 horse power air-cooled radial type which was used extensively in connection with air mail operations. On the Boeing Air-transport Company's lines between Chicago and San Francisco, the Wasp engine was employed, and, having less weight than the Liberty engine on account of its air-cooling, more payload could be carried.

COMMERCIAL AVIATION

AIRPORTS. One of the great developments of the year in the United States was the establishment not only of improved airway facilities, but also of airports. In a report by the Aeronautics Branch of the Department of Commerce, issued on July 15, 1927, it was stated that there were approximately 804 airports and intermediate landing fields permanent in character, this number including only those sites which had been marked in some way and which had more or less facilities for airplanes. In the year previous there had been established over 52 new airports, and it was estimated at the end of 1927 that there were in use about 1000 airports and intermediate fields well distributed over the United States. The 804 fields referred to included 267 municipal, 163 commercial and private airports, 124 Department of Commerce intermediate fields, 287 miscellaneous intermediate fields, 81 Army, Navy, and National Guard fields, one Treasury, and one Agricultural field.

The Department of Commerce lighted and marked intermediate fields at the end of 1928 would amount approximately to 202 as compared with 124 on July 1, 1927. In addition 93 munic-

ipal fields were proposed; while the Department of Commerce had on record some 3000 unimproved fields throughout the country on which landings or take-offs could be made.

Among the municipal airports that of Buffalo, covering 518 acres and equipped at a cost of \$727,255, was a striking example; while the city of Chicago had laid out a great airport with an eight direction runway system, complete night lighting, spacious hangars, and other equipment. Oakland, Sacramento, and San Francisco also were developing air terminals during the year, the last named being referred to below in more detail. Portland, Oregon, was using Swan Island as an airport; while at New Orleans, La., Calender Field had been developed. Cleveland, Ohio, was improving a well designed airport during the year; while Schenectady, N. Y., had a commercial airport, and Baltimore had determined to construct a municipal airport. Kansas City, Mo., voted for a municipal airport which was put under way.

Many other cities were providing airports of improved type and it was estimated that by the end of 1928 a thousand airports would be in operation, a large proportion of which would be municipal. In addition numerous cities and towns were being air marked, and one large company alone had painted city names on more than 4000 of its stations.

The Department of Commerce took over 92 fields in the Post Office Department during the year, 32 of which had been established in the fiscal year 1927, but a number more were added before the close of the calendar year, and others planned for 1928. Beacon lights were placed on a number of airways; while the intermediate fields were well lighted not only as marks, but in case of inclement weather or for forced landings or temporary stops.

In May the city of San Francisco opened a municipal airport at Mills Field. In seven and one half months there were 2895 flights and landings involving 4560 passengers. There was a continual growth of business each month, that for December nearly doubling that of November. As indicating the development and appreciation of this airport the following table giving the monthly statistics is of interest:

	<i>Flights and Landings</i>	<i>Passengers</i>
May	18	15
June	19	17
July	57	85
August	874	601
September	871	678
October	638	1,091
November *	508	756
December	920	1,322

* Decrease due to rain.

New York suffered from having no municipal airport and during the year active measures were being taken by national and local authorities to supply this need, but without any definite action.

During 1927 the Aeronautics Branch of the Department of Commerce began to function under the provisions of the Air Commerce Act of 1926 which afforded important encouragement and support to aeronautics though without direct subsidy. William P. MacCracken, Jr., had been appointed assistant secretary of commerce in

charge of aviation, and on July 9, announcement was made of the appointment of Clarence R. Young of Iowa as director of the Aeronautics Branch, in the Department, created by Congress. There were organized two new units, one for the promulgation and enforcement of air regulations and the other for the collection and dissemination of information on civil aeronautics. The Air Regulations Division was specifically charged with the inspection, registration and licensing of aircraft, the examination and licensing of pilots and mechanics, the identification of all aircraft not licensed, and the promulgation of air traffic rules.

The Aeronautics Branch accordingly promulgated air regulations and appointed experienced aircraft and engine inspectors to form the nucleus of a force which within a year was expected to reach fifty. A medical director was named to organize the work of giving physical examinations to pilots and applicants for pilots' licenses and about 200 physicians at various points throughout the country were designated as medical examiners. Ten new airplanes were purchased or contracted for, of which five were placed in operation. During the year the work of examining applicants for licenses was proceeding, but not all the airmen in the country had applied for license and applications had been submitted for only a small portion of the aircraft in operation. It was estimated that additional civil planes were being placed in operation at the rate of over 100 a month which would increase the problem of bringing all civil craft and their operating personnel under the system of registration and inspection. In 1927 the Department of Commerce received 2762 applications for airplane licenses and had issued 655 with 1645 others pending.

The U. S. Department of Commerce was active also in laying out and providing properly illuminated airways, for the economical use of the airplane in commercial transportation demands flying by night as well as by day and in all vicissitudes of weather and season. It was proposed accordingly to furnish to air traffic those aids which would result in the greatest degree of efficiency. On June 30, 1927, there was 4121 miles of lighted airway, including the 2041 miles on the transcontinental airway which was transferred on that date from the Post Office Department to the Aeronautics Branch of the Commerce Department. (See LIGHTHOUSES.)

According to the Aeronautics Branch of the Department of Commerce more than 12,000,000 miles were covered in civil flying in the first half of 1927. There were carried 395,000 passengers, 621,236 pounds of mail and 1,045,222 pounds of express matter. Airplanes of new design were rapidly replacing the war surplus types which had been doing service. New air routes were being charted in all parts of the country.

AIR MAIL. The United States at the end of 1927 had by far the most extensive air mail system in the world and it was estimated authoritatively that on June 30, 1928, there would be about 24,500 miles of scheduled flying by air transport lines each 24 hours. This mileage includes the air mail contract lines in operation at the end of 1927 and the routes for which contracts had been awarded but which at that time were not yet in operation.

The increase in the amount of mail carried

by the United States Post Office for three years is shown in the accompanying table which also indicates the number of miles traveled with mail.

<i>Fiscal year</i>	<i>Miles traveled with mail</i>	<i>Letters carried (40 per lb.)</i>
1927.....	2,829,553	22,885,000
1926.....	2,256,137	14,145,640
1925.....	2,076,784	9,800,520

When it is recalled that the first air mail route was established between Washington and New York on May 15, 1918, and that in that year only 6000 miles of flight with mail were recorded, the growth of the air mail may be appreciated. Its increase, which must be considered in spite of heavier charges than for rail service, was continuous during the year. There was also an increase in safety, there being only one fatality in the fiscal year of 1927; while in 1926 and 1925 there were two fatalities each year.

On July 1 the U. S. Post Office Department relinquished its activities in commercial transportation, turning over to private companies on a contract basis the carrying of the mail, the last air route passing out of its control on September 1. This transfer of the air mail routes from government to private operation was accomplished without confusion and in a way satisfactory to the Post Office Department and the general public. The contracts were awarded for the most part to strong and competent organizations. Thus the Boeing Air Transport for six months maintained nearly whole-time service over the Rocky Mountains on the 1900 mile route between Chicago and San Francisco, transporting not only the mail but also passengers daily, at least for parts of the distance and not infrequently for all of it, the passage from Chicago to San Francisco costing \$200, and requiring less than 24 hours, in place of three days by train. This important arrangement had reduced the time for mail between New York and San Francisco to 35 hours. The trip between Chicago and San Francisco was possibly the most difficult encountered in any commercial air route in the world as not only must distance be traversed but extremes of altitude and temperature. The journey was divided into nine stages, marked by appropriate landing places and transfer points, at some of which additional mail from feeder lines or railways was received. The route was illuminated by beacons, making possible night flying, and the airplanes were carrying increasingly greater loads. From Chicago the National Air Transport carried the air mail in seven and eight hour scheduled flights to Hadley Field, N. J., 25 miles from New York City. From Cleveland the Colonial Air Transport operated a passenger and express service to Buffalo, which it planned to extend in 1928 to Albany, taking in the various cities along the Mohawk Valley en route and connecting with feeder lines from New York and Boston.

AIRCRAFT PRODUCTION. The year 1927 was a very favorable one for the American aircraft industry and there was practically an increase of 100 per cent over the total number of airplanes produced in 1926. In fact it was the first year in the history of the industry when the output of planes for commercial use had exceeded those designed for the military and naval services. A special survey made by the United States Department of Commerce indicated that 1184

airplanes were manufactured during the calendar year 1926, and of these 636 were commercial planes. While there were no definite and official figures for 1927 available at the end of the year, yet it was estimated that between 2000 and 3000 planes were manufactured including those for commercial aviation as well as those for military and naval service.

An analysis made by the magazine *Aviation* from data collected from the larger producers of airplanes during the year indicated that 1653 commercial planes were produced in 1927, and taking into consideration the military and naval aircraft the total production of the year was 2353. There were 364 airplanes accepted by the United States Navy Department during the calendar year 1927; while the United States Army Air Corps received 289 planes during the fiscal year ended June 30, 1927.

In 1927 there were 103 establishments manufacturing airplanes as compared with 67 in 1926 which was an increase of 23 over the previous year. In the State of California there were 21 establishments producing commercial airplanes; while Ohio with seven establishments produced 460 planes. Of 700 planes manufactured in the year ended Sept. 1, 1927, 348 were built in California and Washington. The Pacific Coast industry gave employment to 1265 persons who received wages amounting to \$1,033,000 and the output of planes was valued at \$4,537,825. The area around New York, of course, was the productive centre of the industry, the plants of the Wright Aeronautical Corporation, the Fairchild-Camenev Engine Corporation, the Curtiss Aeroplane and Motor Corporation, the Atlantic Aircraft Corporation, the Chance Wright Co., the Loening Co., and G. M. Bellanca, all being located in the metropolitan district, while the Pratt & Whitney Co., manufacturing the Wasp and Hornet engines, was at Hartford, Conn., and the Anthony H. G. Fokker Co. had determined to build at Wheeling, W. Va.

GUGGENHEIM SAFETY COMPETITION. On April 30, 1927, the Daniel Guggenheim Fund for the Promotion of Aeronautics announced the Safe Aircraft Competition for prizes totaling \$150,000 and this straightway aroused great interest among European and American aircraft manufacturers and designers. On the first day on which entries could be received five British and five American builders made application and additional entries were expected before the competition closed on Oct. 31, 1929, or at any time prior to that date if the trustees of the fund should consider that the object of the competition had been achieved. Aircraft entered in this competition were designed to provide certain characteristics and capacities which were required by technical experts of aerial safety. Many of these characteristics had been accomplished in individual planes, but the object of the competition was to coördinate the various elements and principles and develop a safe airplane which would be acceptable to the general public. The minimum performance requirements were: A. Minimum flying speed 35 m.p.h. b. Minimum gliding speed 38 m.p.h. c. Top speed of 110 m.p.h. d. Initial climb of 400 ft. a minute. e. Landing run of 100 ft. f. Approach over an obstruction 35 ft. high, and coming to rest 300 ft. from the base of the obstruction. g. Take off in 300 ft. h. Take off over an obstruction 25 ft. high in a distance of 500 ft. from base

of obstruction. i. Flattest glide at 8° to the horizontal. j. Steepest glide at 16° to the horizontal.

BIBLIOGRAPHY. Among the more important works in aeronautics published during the year were the following: *Adventure and War*: Roald Amundsen and Lincoln Ellsworth, *First Crossing of the Polar Sea*; Charles A. Lindbergh, *We*; H. A. Toulmin, *Air Service*, A. E. F., 1918; Floyd Gibbons, *The Red Knight of Germany*, the story of Baron Richthofen; Roald Amundsen, *My Life as an Explorer*; Alan Cobham, *My Flight to the Cape and Back, Australia and Back*; Oliver Stewart, *Strategy and Tactics of Air Fighting*; J. M. Spaight, *Aircraft and Commerce in War, Air Power and War Rights*; Walter Mittelholzer and others, *By Airplane Towards the North Pole*; Jefferson Davis, *World's Wings*; J. Laurence Pritchard, *The Book of the Aeroplane. Aerodynamics*; Walter S. Diehl, *Engineering Aerodynamics*; E. P. Warner, *Aerodynamics and Airplane Design*. Balloons and Airships: Thomas L. Blakemore and W. Watters Pagon, *Pressure Airships*; Lehmann and Mings, *The Zeppelins*; C. P. Burgess, *Airship Design*; "Neon," *The Great Delusion*. Landing Fields and Airways: Donald Duke, *Airports and Airways*; Lowell Thomas, *European Skyways*. Flying: Captain Horatio Barber, *The Aeroplane Speaks, Aerobatics*; Lord Thomson, *Air Facts and Problems*; V. W. Page, *Modern Aircraft*. Legal Aspects of Aeronautics: Carl Zollman, *Law of the Air*; Rowland W. Fixel, *Law of Aviation*. Historical: L. Lat. Driggs, *Heroes of Aviation*.

Among the important books of the year published in England were the following: *All the World's Aircraft*, the seventeenth year of this publication which is edited by C. G. Grey, editor of *The Aeroplane*; the Rt. Hon. Sir Samuel Hoare, M. P., Secretary of State for Air, *India by Air*; Major C. C. Turner, *The Late Flying Days*; James M. Spaight, *The Beginnings of Organized Air Power*; C. L. M. Brown, *Conquest of the Air*; J. B. Hart and W. Laidler, *Elementary Aeronautical Science*.

AÉROPLANES, See AÉRONAUTICS.

AFGHANISTAN, af-gān'-i-stān'. An independent kingdom of Asia between the parallels 29° and 38° 20' north latitude and 61° and 72° east longitude with a narrow strip extending to 75° east. The estimates of the area vary from 245,000 to 270,000 square miles. The population is estimated at about 12,000,000 although some authorities place it at about half that number. Capital, Kabul, with a population of about 100,000. Other important towns are Kandahar, Herat, and Mazar-i-Sharif. The Afghan is the dominant race, and the chief tribes are the Duranis and the Ghilzais, numbering about 2,200,000. The prevailing languages are Persian and Pushtoo, and the dominant religion is Islam.

In the spring of 1927 it was reported that Afghanistan was departing from its traditional policy of nonintercourse with other nations. Evidence to support this theory was the appointment of a consul, Bashir Ahmad, to the city of Karachi, India. Heretofore, Afghanistan commercial interests had been represented in India by a trader who, in addition to his business in piece goods and general lines of merchandise, acted as his government's trade agent. It was also reported that during the past two years the highways of the country had been greatly improved and that more roads were being built

during 1927. As Afghanistan has no railways, development of motor roads there was of prime necessity. Evidences were also present of the government's intentions of building railways. Afghanistan was deeply concerned with the exploitation of its natural resources, and, although no complete survey of the country's resources had been made, it was known to be rich in coal, iron, and precious stones, and to possess large agricultural and pastoral areas.

The country has no financial institutions and, therefore, all commercial transactions are conducted through the medium of currency, principally rupees. Notwithstanding the primitive methods of doing business, the country's foreign commerce amounts to \$10,000,000 annually, equally divided between imports and exports. The country's fruits, melons, raw wool, shawls, and rugs are exchanged for cotton piece goods, yarn, manufactured leather goods, tea, metal manufactures, wearing apparel, dyes, automobiles, and lac.

Since 1922 the government of Afghanistan has been a constitutional monarchy with legislative and state assemblies, and a cabinet which is presided over by the king himself. The reigning king in 1927 was Amanullah Khan, who ascended the throne as Amir, when his father was assassinated in 1919. In 1922 he changed his title from Amir to King. Nothing of national or international importance regarding Afghanistan was published in the press during the course of the year.

AFRICA. The various divisions of Africa in this volume are discussed under their own heads. See articles on the respective countries and territories, including ETHIOPIA; KENYA; EGYPT; MOROCCO; TUNIS; SOUTH AFRICA, UNION OF, etc. See also the articles ANTHROPOLOGY; ARCHEOLOGY; and EXPLORATION.

AGRICULTURAL EXPERIMENT STATIONS. The development of research at the State agricultural experiment stations throughout the United States continued during the year under the Federal appropriations. These appropriations increased as a result of the Purnell Act by \$480,000, or \$10,000 for each of the stations. The amount under that act totaled \$1,440,000 for the fiscal year ended June 30, 1927, and an equal amount was available under the Hatch and Adams Acts of 1887 and 1906 respectively. Each State received, therefore, \$60,000 for its experiment station, or a total for all of \$2,880,000. In addition, Federal experiment stations were maintained in the territories and insular possessions—Alaska, Hawaii, Porto Rico, Guam, and the American Virgin Islands, with a varying allotment aggregating \$233,980.

As in the past, most of the States generously supplemented the Federal appropriations, the amounts varying all the way from a few thousand dollars up to several hundred thousand. Fifteen States each provided over a hundred thousand dollars for their experiment stations. The aggregate State appropriations were over \$9,000,000, making the combined Federal and State support approximately \$12,000,000 for the year. The stations had some 5000 active research projects, covering the broad field of agricultural production, agricultural economics, rural sociology, and home economics, including the practical and the scientific aspects of the problems involved. More and more their investigations were leading the stations into the field of original

inquiry in the sciences related to agriculture, in order adequately to understand their problems and secure exact information which can be reliably and intelligently applied to practical questions.

To assist in outlining the research field in rural sociology and formulating projects in that subject, as provided for under the latest Federal appropriation act for experiment stations, an Institute on Research Methods in Rural Sociology was held at Purdue University from April 4 to 8 inclusive, 1927. It resulted from a movement sponsored by the research workers themselves and was widely attended. It was considered a marked success and a significant step in the development of research in this relatively new field.

The U. S. Bureau of Education was granted an appropriation to make a study of the organization, administration, and work of the land-grant colleges, with which the agricultural experiment stations are connected. The stations were to be included in this survey, plans for which were under way, with the advice and assistance of specialists whose services had been secured.

There was an unusual number of changes in directorship during the year, the directors of the Alaska, Massachusetts, New York, Texas, and West Virginia Stations resigning to retire or engage in work elsewhere. F. B. Morrison of Wisconsin became director of the New York Stations. Dr. Thomas F. Hunt, for many years director of the experiment station in California, died April 25, 1927. Dr. Charles E. Marshall, a bacteriologist of note, connected with the Massachusetts Station, died March 20, 1927.

A gift of \$130,000 for the endowment of a research professorship in forest soils was made to Cornell University by the Charles Lathrop Pack Forestry Trust, together with additional funds for operating expenses in the advanced line of investigation to be undertaken. The enterprise will be assigned to the College of Agriculture. It constituted a new development in forest research in the United States, and was to deal primarily with the chemistry and biology of soils.

An experimental farm connected with the University of Virginia, bequeathed by the late Graham F. Blandy, was under development, with Dr. O. E. White of the Brooklyn Botanic Garden as director. Five research fellowships were established, open to graduates in biology or agriculture from standard colleges, the appointees to register for advanced work in the University.

A bequest of the late Mrs. Elizabeth Blee Frasch of \$1,000,000 to establish the Herman Frasch Foundation for Chemical Research, the income to be devoted to research in agricultural chemistry, was upheld by the New York Court of Appeals. The experiment stations, as leading exponents of research in that field, were entitled to share in the grants under this bequest.

The Dominion Grain Research Laboratory has been established in Winnipeg, Manitoba. It is under the supervision of the Board of Grain Commissioners, and is designed to assist in the solution of technical problems. It is equipped for investigations in milling and baking, with laboratories for general research, and is conducting some cooperative investigations on the value of tough and dried grains, under the supervision of the Canadian National Research Council.

Plans were approved for the early establish-

ment of a German National Tobacco Research Institute, near Karlsruhe. A grant of 150,000 marks from the National German Government and 50,000 marks from the State of Baden was contributed for the operation of the institute during 1927. Among the problems to be studied are those relating to cultural methods, fertilizers, and the introduction of foreign tobacco strains.

An institute for rubber research was incorporated by the legislature of the Federated Malay States and established. It is financed by government funds and is controlled by a board representing both the government and the rubber-growing interests. It will concern itself with chemical and physical work on soils, latex and preparation of rubber, plant nutrition and physiology of growth, pathology, and similar matters relating to the rubber industry.

Consult also *Report on the Agricultural Experiment Stations, 1926*. U. S. Department of Agriculture, Office of Experiment Stations.

AGRICULTURAL EXTENSION WORK.

Coöperative extension work in agriculture and home economics was carried on in the 48 States by the U. S. Department of Agriculture and the State agricultural colleges under the Smith-Lever Extension Act of May 8, 1914, and related Federal and State legislation. Through this system over 4,000,000 instances of the adoption of improved practices on the farms and in the farm homes in 1926 were reported. These were brought about largely by the successful conduct of practical demonstrations to farmers and their families under the direction of the extension agents and through meetings, tours, campaigns, press articles and other activities of the extension forces. The county extension agents in every State coöperated with local committees in studying the economic needs of their counties and helped to organize programmes of work based on such needs in 31,422 communities. In marketing of farm products extension agents gave assistance to about 425,000 farm families and more than 3000 cooperative associations, which did a business of \$232,000,000 at an estimated saving to farmers of \$16,000,000. The work among the farm women related to clothing, foods, nutrition, house furnishing, home management, health and sanitation. The women made about 320,000 demonstrations of improved home practices, more efficient local leadership among farm women was developed and 14,800 community clubs with 285,000 members were in operation.

The work among farm youth increased in variety and importance. Over 40,000 4-H clubs enrolled about 600,000 boys and girls, who carried on demonstrations on the farms or in the farm homes with the assistance of about 50,000 volunteer local leaders. This work included the growing of corn, cotton, potatoes and other field, truck and orchard crops; the raising of high quality livestock and standard-bred poultry; canning of fruits and vegetables, making of garments, food preparation, beautification of home grounds, etc. For the first time a national 4-H club camp was held at Washington, D. C., in June, 1927. Two boys and two girls from each State, accompanied by two State leaders or assistant leaders, were invited to attend. Forty States were represented in this camp, including all regions except the far West. A conference on club problems and leadership training was held

at the same time. There were also visits to the Government departments, trips about Washington and vicinity, inspirational addresses by prominent speakers and recreation. Over 1000 boys and girl belonging to 4-H clubs in 42 States attended the International Livestock Exposition at Chicago in 1927, where a national club congress was held and prizes were given in various competitions.

Emergency situations in various sections of the country in 1927 brought out the great usefulness of the extension service in times of distress. The sharp reduction in the price of cotton in the fall of 1926 brought acute financial trouble to many farmers in the South. This led the extension agents there to push measures for immediate relief and at the same time to emphasize the importance of a safe farming programme to prevent recurrence of such disasters. The fall seeding of oats and wheat where practicable was urged as an immediate relief measure. The planting of more corn and soy beans in the spring, the growing of potatoes, sweet potatoes and truck as cash crops, increase of dairy cattle and poultry and the production of more of the family food supply were stimulated with beneficial results.

The spread of the corn borer in the Great Lakes region and the consequent threat to the corn crop in the corn belt led Congress to appropriate \$10,000,000 for an intensive campaign to control this pest in the infested area. The Extension Service of the Department of Agriculture and its cooperative agents in Indiana, Michigan, New York, Pennsylvania and Ohio were drafted to conduct the educational features of this campaign. These included the holding of field meetings and demonstrations, preparation and distribution of publications, posters, motion pictures, lantern slides and exhibits, and the maintenance of a news service in all the daily and weekly papers in the area. The work was carried on in 82 counties by the county agricultural agents, assisted by the regular staff of entomologists, agricultural engineers, editors and supervisory officials. Temporary assistant county agents and clerks were also employed. It is intimated that 90 per cent of the farmers voluntarily carried out the control work imposed upon them.

In Florida the extension forces in the counties laid waste by the hurricane in September, 1926, materially aided the farmers by encouraging the planting of gardens and developing quick resources of home-grown food supplies.

In connection with the Mississippi Valley flood the extension organization in Mississippi, Louisiana, Arkansas and Missouri cooperated closely with the Red Cross in strengthening the levees, aiding in the evacuation of the flooded territory and obtaining supplies for the refugee camps. When the waters receded the county agricultural agents actively aided the planting of crops, the rehabilitating of homes and the securing of seeds, livestock and supplies. The home demonstration agents helped the women to put their homes in good sanitary condition and to get home-grown food as soon as possible. They also obtained large amounts of canned fruits and vegetables and other supplies as contributions from farm families outside the flood area. Near the close of the year extension agents in Vermont did much to relieve the distress of people in the flood area there.

The demonstration work on the Federal reclamation projects, now carried on through the Extension Service of the Department of Agriculture, centred largely around the development of livestock industries and stressed improved feeding practices, pure bred sires, sanitation and organized marketing of farm products.

The special Federal appropriation of \$50,000 for forestry extension work greatly stimulated the activities of extension foresters and county agents in 30 States. Nearly 4000 forest planting demonstrations were reported and measures were taken to improve woodland management and forest protection.

The motion picture laboratory of the Department of Agriculture had nearly 400 films, and a large number of these were in active circulation. The attendance reported at showings of department films totaled 4,300,000.

The Office of Exhibits made exhibits at 34 State, interstate and national fairs, and at the World's Poultry Congress at Ottawa, Canada.

For the fiscal year beginning July 1, 1927, about \$500,000 was appropriated for the Extension Service in the United States Department of Agriculture. Of the \$20,400,000 used in the States about \$1,050,000 was derived from direct appropriations to the Federal Extension Service, \$4,580,000 from the Smith-Lever Act and \$1,300,000 from the supplementary Federal fund, making the total amount of the Federal contribution \$6,930,000.

This was met by approximately \$13,468,000 from sources within the States, including \$5,400,000 to offset the regular and supplementary Smith-Lever fund, \$2,386,000 additional State and college funds, \$4,673,000 from counties and \$1,029,000 from farm bureaus and miscellaneous sources. About \$10,440,000 was used for the demonstrations and other activities of the county agricultural agents and their leaders. Much of their work bore on the problems of the farm home but \$3,527,000 was allotted to the work of the home demonstration agents. About \$1,215,000 was used for special work among boys and girls, about \$3,850,000 for the tasks of the specialists in various branches of agriculture and home economics, \$867,000 for administration and \$250,000 for publications.

On June 30, 1927, there were in the 48 States 2263 white county agricultural agents, 910 home demonstration agents, 153 paid county leaders of boys' and girls' club work, and 977 specialists in the various branches of agriculture and home economics with headquarters at the agricultural colleges.

The white agents did much effective work which directly benefited the negro farmers and their families, but in the Southern States there were also 177 negro agricultural agents, 177 negro women agents and six negro club agents. The work in each State was administered by an Extension Director, with numerous State and district leaders. Including the supervisory officers and their assistants 5055 persons trained in agriculture or home economics were employed in the extension work in the States in 1927. These public agents were assisted by over 200,000 voluntary local leaders in rural communities in the several States.

The general interests of the extension work throughout the United States were promoted by the Extension Service of the United States De-

partment of Agriculture under the supervision of the Director of Extension Work. This Service included (1) the Office of Cooperative Extension Work, which deals with the Department business under the Smith-Lever Act and related Federal legislation, (2) the Office of Exhibits, which makes agricultural exhibits at State, interstate and international fairs, (3) the Motion Picture Laboratory, which prepares scenarios and films on subjects connected with the work of the Department, and (4) the Office of Agricultural Instruction, which prepares publications on agricultural subjects for the use of secondary and elementary schools.

Farmers' institutes were held in 1926 under official supervision in 12 States. In nine States the agricultural colleges held 2130 institutes with an attendance of 969,864 at a cost of about \$91,162. In three States where the institutes were managed by the State departments of agriculture 719 institutes were held with an attendance of 192,756 at a cost of \$101,474. Over 61,400 demonstrations were conducted by negro farmers and 179,500 negro women adopted improved practices through home demonstration work. About 21,960 negro boys and 38,230 negro girls were enrolled in clubs.

In Hawaii extension work was continued by the Federal Experiment Station and in Porto Rico by the Insular Bureau of Agriculture, which maintained four district inspectors, 15 deputy inspectors and 33 agricultural agents in the municipalities. A publication entitled *Revista de Agricultura* was issued. The Federal Station in the American Virgin Islands had an extension agent on the Island of St. Thomas.

GREAT BRITAIN. In England and Wales extension work was continued through the County Agricultural Councils on plans approved by the Ministry of Agriculture and Fisheries. In 1926, 324 men and women gave their whole time to extension instruction. Of these 49 were agricultural organizers in 53 counties, who did demonstration, lecture and advisory work and directed the activities of specialists. There were 77 instructors in agriculture, 77 in horticulture, 48 in dairying, 36 in poultry, 23 in dairying and poultry combined, and 15 in farriery, beekeeping, veterinary science, farm accounting or manual processes. The women's rural institutes continued to grow in numbers and popular favor. While chiefly attended by the married women, there were junior groups in a number of counties. These institutes are doing much to provide training in practical and technical subjects and to improve village life and are aiding local education committees in child-welfare work.

The courses and lectures given in connection with the institutes deal not only with home economics and handicraft but also with English literature, history, citizenship, arithmetic, household accounts, singing and music. Continuation classes for rural boys and girls from 14 to 16 years old were planned by the interdepartmental committee of the Ministry of Agriculture and the Board of Education, acting in an advisory capacity to aid local education authorities. The plan involves evening, afternoon and whole-time courses during the winter months, in English, history, geography, arithmetic, farm book-keeping, nature study, and craftsmanship, and in livestock, poultry, dairying, horticulture, beekeeping and home economics. The rural community councils, formed after the World War to aid

persons needing employment, now promote in a general way social, educational and industrial activities in the villages. Oxford County was a pioneer in this work and was soon followed by Kent County. In 1926 there were councils in 10 other counties. In Kent County over 20 organizations are represented in the council.

In Scotland the women's rural institutes, begun in 1917, had spread throughout the country. In October, 1925, there were 420 institutes with 27,500 members. They are grouped in areas consisting of several counties. A committee in each area elected by delegates from the institutes, receives and administers funds, encourages the work of the institutes, elects two members to serve on the central committee and convenes meetings of the institutes within the area. The central committee meets with a representative of the Board of Agriculture acting in an advisory capacity, to receive and administer funds and if necessary to raise funds for the institutes. The Board of Agriculture disseminates information useful to the institutes, helps to form new institutes and encourages those in operation. For the past five years the Board has granted to the institutes 3000 pounds a year, and thus has met all their expenses. It is now expected that they will be self-supporting.

In Ireland the organization known as United Irish Workers, founded in 1910 as a branch of the Irish Agricultural Organization Society, performs to a considerable extent functions similar to those of the women's rural institutes. A monthly magazine is published by the board of managers of the association.

CANADA. In the several provinces extension work was continued by public agents and through short courses at colleges and boys' and girls' clubs. In British Columbia the work of the pig, calf and poultry clubs was actively promoted. In the Mission district particularly the poultry clubs were very successful under the influence of the poultry instructor and the competitions at the fair of the Mission Agricultural Society.

In the province of Quebec boys' and girls' swine clubs were stressed with a view to stimulating the bacon hog industry. A special feature at the fairs was the car-load-lot entry consisting of at least 60 hogs furnished by one or two clubs. In Nova Scotia as the result of the report of an agricultural inquiry committee in 1926, extension activities were greatly stimulated. The work was reorganized under the Ministry of Natural Resources. An extension director was appointed under whom were 10 agricultural representatives, four of whom worked in single counties and the other in two or more counties.

AUSTRALIA. The extension work in South Australia was reorganized in 1926 under the Department of Agriculture. Five agricultural instructors were appointed and assigned to districts including five to 15 counties. Their duties included lectures to representative agricultural bodies, the holding of classes for adults on special agricultural subjects, the establishment of demonstrations by farmers on their own farms, the organizing of crop and other competitions, and the giving of information and advice to public school teachers and to farmers.

In Victoria radio lectures on agricultural subjects were broadcast three nights a week by specialists of the Department of Agriculture. In Western Australia the courses on subjects in

home economics were continued by the Department of Agriculture in cooperation with Perth University. Two lectures were given each morning during the course, the afternoon and evening being left free for excursions and entertainments.

UNION OF SOUTH AFRICA. Since Apr. 1, 1926, boys' and girls' club work had been under the supervision of the division of agricultural education and extension in the Department of Agriculture. Such clubs inaugurated by the Transvaal Agricultural Union were known as Prosperity League Clubs. This name later was adopted for clubs organized anywhere in the Union. Close cooperation with the rural schools is maintained. The teachers organize and manage the clubs, which carry on demonstrations, contests and other activities in much the same way as similar clubs in the United States.

The Transvaal Agricultural Union also established a women's branch with local organizations which do work in educational, civic, social and commercial lines, corresponding in a general way to the activities of the women's institutes in England.

INDIA. The agricultural departments of the various provinces continued to employ extension workers in cooperation with agricultural associations, cooperative societies and other agencies.

FRANCE. The extension organization under the Ministry of Agriculture included inspectors-general in the eight agricultural regions, directors of agricultural services in the several departments (counties), and professors of agriculture or special subjects. Work in agriculture and home economics for women and girls was continued. Agricultural associations also carried on much extension work.

BELGIUM. The Ministry of Agriculture continued to carry on extension work through numerous specialists in agriculture, veterinary medicine, forestry and farm housekeeping. A unique feature is the caravan farm-household management school, introduced after the World War to hold classes for farmers' daughters in the devastated regions of Flanders. Courses of three or four months and of shorter duration are held. Four vans about 23 feet long and 8 feet wide are used and are so placed as to form a large classroom, with two smaller rooms on each side. These rooms are furnished to represent a house with classroom, dining room, kitchen, bedroom, and dairy. Beginning with 1925 the League of Belgian Peasants added to its activities the organization of boys' clubs. Meetings largely attended by young peasants were held in the several provinces and several thousand boys were enrolled. These clubs work in close connection with the guilds of adult farmers. In the winter study sections are formed and in the summer there are excursions to experimental fields, exhibitions, etc.

DENMARK. Extension work continued to be carried on by the Department of Agriculture, the Royal Agricultural Society, and about 120 local farm organizations.

THE NETHERLANDS. The Department of Agriculture carried on extension work through inspectors of agriculture. Advisers in agriculture and horticulture were located in the 11 provinces, together with specialists in dairying, animal husbandry, poultry and bee-keeping.

SWEDEN. Extension work continued to be carried on by over 200 advisers and experts employed by the 26 county agricultural societies,

subsidized by the general government. The young farmers' league continued its activities, which resemble those of boys' and girls' clubs. Local groups are formed in the several parishes, under the direction of boards of at least three adults. The league receives contributions from the government and the general agricultural society of Sweden. There are also grants from the Clara Lachman fund to provide for an exchange of speakers from Denmark, Norway and Sweden, and from the Rockefeller International Education Board to aid in training leaders.

FINLAND. The women's organization, known as The Martha Association, founded in 1899 was divided in 1925 into two bodies according to the use of the Swedish or Finnish language in any region. One of the main objects of these societies is to improve the economic condition of the small home by encouraging such industries as poultry raising, weaving curtains or doll making. The local groups have lectures, housekeeping courses, instruction in industries, excursions to farms and schools, and competitions at fairs. The work is supported by contributions from communes, agricultural societies, banks and individuals, together with a moderate annual subsidy from the government.

GERMANY. Every farmer is required to keep an account of his business and as a consequence the work of the farm bookkeeping bureaus has greatly increased. The bureaus organize bookkeeping on the farm or keep books for the farmer on the basis of weekly or monthly reports. They also encourage farm bookkeeping, especially on small farms, through special courses, lectures and sale of forms. In Prussia, Brandenburg, Saxony, Silesia and the Rhine province the itinerant schools of rural housekeeping were successfully continued without State subsidy. And in Prussia there were also rural continuation schools for girls.

POLAND. Associations of the older and young farm women were doing useful work. The latter organized young women in the villages into clubs and helped them in acquiring the necessary preparation for their future work as farm wives. The clubs have lectures, theatricals, pageants, dances and excursions. In the winter a three-months course for training women to give instruction in sewing was held. The work among the young women has the collaboration and support of the Ministry of Public Instruction and various social organizations. The Association of Rural Young People included over 2500 boys' and girls' clubs with about 90,000 members and the Union of Polish Youth had over 100,000 members. These organizations had a variety of educational and recreational activities and issued many publications.

CZECHOSLOVAKIA. The Association for the Interest of Rural Women, founded in 1918 and the Association of Rural Welfare, organized in 1925, were in successful operation. Over 30 per cent of the persons engaged in agriculture, silviculture and pisciculture in Czechoslovakia are women. These associations aid the farm women to perform their work intelligently on the farm and in the home, encourage modern practices and the use of improved implements, and promote the establishment of cooperative associations, day nurseries and libraries.

The Institute of Farm Bookkeeping and Rural Economy of the Republic of Czechoslovakia collects data on farm incomes, educates farmers in

keeping accounts, and keeps the accounts of those farmers who pay fees. The general expenses of the institute are defrayed by the Ministry of Agriculture.

SWITZERLAND. The Swiss Peasants Union conducted extension work through traveling lecturers, who also gave oral and written information on agricultural subjects.

SPAIN. A Service of Itinerant Chairs was established by royal decrees of Oct. 18, 1926, and Mar. 24, 1927. The chairs were provided for in 12 regions, with headquarters in agricultural schools or associations, and were supervised by two inspectors-general. The chief of the chair may be assisted by specialists in the important branches of agriculture in the several regions. Experiments, demonstrations, analyses of soils, seeds, etc. will be made.

ITALY. The great interest of the present government in increasing agricultural production in Italy has led to financial provision for a larger number of itinerant teachers to instruct the farmers in intensive methods of agriculture and the use of new crops and improved implements.

Consult *Report of the Director of the Extension Service*, 1927, by C. W. Warburton (United States Department of Agriculture).

AGRICULTURAL LEGISLATION, UNITED STATES. On Feb. 11, 1927, the McNary-Haugen farm relief bill, introduced into Congress late in 1926 and described in the 1926 YEAR BOOK under *Agricultural Legislation*, passed the Senate by a vote of 47 to 39 after an amendment to include tobacco along with wheat, corn, swine, cotton, and rice as the commodities for which stabilization of farm prices was to be attempted. Passage in the House of Representatives followed on February 17 by a vote of 214 to 178, but on February 25 the bill was vetoed by President Coolidge. In his veto message the President stated in substance that he did not believe the bill would prove to be economically practicable, and that it would discriminate against the large number of farmers whose products were not included under its provisions, and he included an opinion rendered by the Attorney General expressing the belief that in several respects the bill was also unconstitutional. He suggested that other plans before Congress offered promise of sound assistance to farmers "without these unconstitutionality, invasions of executive authority, this contracting with packers and flour millers and other manufacturers, this overproduction with its inflation and inevitable crash, without this indirect price fixing, buying and selling, this creation of huge bureaucracies. They are, on the contrary, devoted entirely to the principle of building up farmer-controlled marketing concerns to handle their problems, including occasional surplus production, and applicable to all agriculture and not to a minor fraction," and he recommended the adoption of some such plan. In the few days intervening before the final adjournment of the session on March 4, no attempt was made, however, to pass the McNary-Haugen bill over his veto or to enact alternative legislation.

Upon the convening of the Seventieth Congress on December 5, President Coolidge's annual message again devoted considerable space to the agricultural problem and in particular to the agricultural surplus. He declared that while it is "impossible to provide by law for an assured success and prosperity for all those who engage

in farming," and that "if acreage becomes overextended, the Government can not assume responsibility for it," none the less the Government can assist cooperative associations and other organizations in orderly marketing and handling a surplus clearly due to weather and seasonal conditions in order to save the producer from preventable loss. In his opinion, "a beginning could be made by setting up a Federal board or commission of able and experienced men in marketing, granting equal advantages under this board to the various agricultural commodities and sections of the country, giving encouragement to the cooperative movement in agriculture, and providing a revolving loan fund at a moderate rate of interest for the necessary financing."

The remaining days of December saw the re-introduction of the McNary-Haugen bill with some modifications, including its extension to all farm products, but retaining the equalization fee principle to which objection had been raised. A number of other measures proposing to relieve the agricultural situation in a wide variety of ways were also brought forward. At the close of the year it was expected that agricultural relief would again prove to be one of the major issues of the session, but as the radical differences of opinions which had thus far prevented legislation in this field seemed still to prevail, the outlook for ultimate agreement appeared to be correspondingly uncertain.

Despite the virtual deadlock on the problem of the agricultural surplus, considerable legislation along other lines was completed during the year. Prominent among this was the annual act making appropriations for the support of the Federal Department of Agriculture, discussed elsewhere (see AGRICULTURE, U. S. DEPARTMENT OF); a special appropriation of \$10,000,000 to enable the Secretary of Agriculture to cooperate with the States, organizations, or individuals in the eradication of the European corn borer; and an act authorizing an appropriation of \$8,000,000 to enable the Secretary to make loans to farmers in the drought- and storm-stricken areas of the Northwestern States and the cotton States for the purchase of seed grain, feed, and fertilizer. The last-named appropriation itself was included in a deficiency bill which failed of passage and hence was not available, but reduced emergency transportation rates to and from sections suffering from disaster were authorized in an amendment of the Interstate Commerce Act and Transportation Act of 1920.

Under a law signed March 4 discrimination against farmers' cooperative organizations by boards of trade and similar organizations was forbidden. A measure approved March 3 prohibited the destruction or "dumping" without sufficient cause of any perishable farm products received in interstate commerce or the District of Columbia by commission merchants and others, and required a true and correct accounting. The collection of additional cotton statistics by the Secretary of Agriculture was authorized and their dissemination regulated, and an amendment was adopted to the U. S. Cotton Futures Act for the settlement of disputes as to grades in future contracts. The agricultural Credits Act of 1923 was extended to cover the discount of notes, drafts, etc., based on agricultural crops being grown for market.

The importation of milk and cream into the

United States was regulated in an act signed February 15, designed to promote the dairy industry of the country and conserve the public health. Permits must now be obtained from the Secretary of Agriculture for milk and cream importations, based either on inspections by the Department or at its discretion on certificates by accredited officials of foreign Governments or a State or municipality of the United States.

A method for leasing the public lands of Alaska outside of the national forests and certain other areas for grazing purposes was prescribed in charge of the Secretary of the Interior. With a view to encouraging the breeding of riding horses suitable for the army, the Secretary of War was empowered to accept donations of horses for breeding and donations of money or other property to be used as prizes or awards at agricultural fairs, horse shows, and similar exhibitions.

The establishment and maintenance of a national arboretum on land within or adjacent to the District of Columbia, for purposes of research and education concerning tree and plant life, was authorized in an act signed March 4, although the acquisition of the land was delayed by failure to obtain the necessary appropriation until the enactment of a deficiency appropriation act approved December 22. This arboretum was to be developed with special reference to the agricultural, horticultural, and forestry interests of the Department, so correlated as to bring about the most effective utilization of its facilities and discoveries.

Much of the agricultural legislation which failed of enactment in the Sixty-ninth Congress was reintroduced into the Seventieth Congress, together with a considerable number of new projects. In addition to the agricultural surplus and similar relief bills already mentioned, these measures sought to provide for the disposition of the Government's holdings at Muscle Shoals, Ala., long a matter of controversy as potential producers of fertilizer and power; and included the "truth in fabrics" bill, designed to advise the consumer of the actual content of virgin wool; bills regulating transactions in future markets and the collection of statistics and the dissemination of crop predictions by official agencies; providing additional funds for agricultural extension work; and authorizing appropriations for various local experimental projects. Those measures were pending before the appropriate committees at the close of the year.

AGRICULTURAL MACHINERY. See AGRICULTURE.

AGRICULTURE. Substantial progress was made in 1927 in the recovery of American agriculture from the effects of post-war depression. This was evidenced in better balanced production, in advancing prices for several important products, notably cotton and cattle, and in further improvement in the relationship between the prices of farm products and the prices of other goods. As the U. S. Department of Agriculture pointed out, since June, 1921, when the depression was at its lowest, the unit buying power of farm products had increased more than 35 per cent. This means that agriculture had regained more than three-fourths of the buying power lost per unit of its products in the post-war price decline. Furthermore, the productivity of American agriculture, as measured by the output per farm worker, had increased greatly

in the last few years. On fewer acres and with a farm population nearly 3,000,000 less than in 1919, agriculture since 1923 had averaged a larger volume of production than in the years immediately following the War. This suggests a reduction in the cost of production, despite continuing high overhead and labor expenses, a view strengthened by recent data made available. It is a reasonable inference that the farmers, through increased efficiency, were offsetting, to some degree at any rate, the effect of unfavorable relative prices. While the troubles of the farmer were not yet over, the balance of the year's developments was on the side of progress.

From 1919-24 there was a decrease of 13,000,000 acres in crop land in the United States, the first decrease ever shown by census statistics in the agricultural area. At the same time, there was a decrease in the number of farm animals, a decrease in the number of farms, and a falling off in farm population. Despite this, there was a very substantial increase in crop production in the period 1922-26, as compared with 1917-21, estimated at about 5 per cent. The output of animal products likewise showed an increase, estimated at fully 15 per cent. The result has been an increase in farm production more rapid than the rise in the country's population.

Two circumstances stand out prominently in the year, namely, the floods in the Mississippi Valley in the spring and in New England and New York in the fall, and the inauguration of an intensive campaign against the European corn borer. The latter was made possible by a Congressional appropriation of \$10,000,000, in the endeavor to clean up infested areas and prevent the further spread of the insect. It was the most extensive campaign of its kind ever undertaken and met with a gratifying degree of success. See ENTOMOLOGY, ECONOMIO.

The great flood in the lower Mississippi Valley did enormous damage to agriculture, entailing great losses of stock and buildings and injury to land. The overflow covered 18,269,000 acres in the States of Illinois, Missouri, Kentucky, Tennessee, Arkansas, Mississippi, and Louisiana, nearly 4,500,000 of which were planted to crops in 1926. It was estimated that 2,000,000 acres of this crop land would make no substantial money returns in 1927. More than half the cultivated land in the flooded area, or about 2,600,000 acres, is normally in cotton, about 1,100,000 in corn, 360,000 acres in hay, and 370,000 acres in other crops. The estimated livestock losses included 25,000 horses and mules, 50,000 cattle, 150,000 swine, and 1,250,000 poultry. The total loss by the floods was placed by the Weather Bureau from the compiled data at between \$350,000,000 and \$400,000,000. Since the lower Mississippi Valley is primarily a farming section, with comparatively few large cities on the lowlands, the flood losses were mainly agricultural. The U. S. Department of Agriculture, the State agricultural colleges and experiment stations, the agricultural extension service, and other agencies gave very practical assistance, while the American Red Cross and voluntary relief contributions lent relief to the flood sufferers. See FLOODS.

Severe floods occurred in the New England States and New York in the fall, causing heavy loss, particularly of farm buildings, livestock, and crops, and injury to farm lands. Vermont

suffered particularly heavily. In that State it was estimated that 15,000 milch cows perished. Farmers of the flooded districts were said to be abandoning their farms to take up day labor. Their difficulties were emphasized by the fact that 50 per cent of the Vermont farms were mortgaged before the flood, and the farmers in the inundated regions were unable to raise more money on their property for rehabilitation purposes.

Two important scientific meetings of the year were the First International Congress of Soil Science, at Washington, June 13-22 (See SOILS), and the Third World's Poultry Congress, held at Ottawa, July 27 to August 4 (See LIVESTOCK). Both of these gatherings were largely attended and resulted in much benefit to technical agriculture.

The International Economic Conference at Geneva in May gave considerable attention to agricultural affairs such as agricultural problems in their international aspects, agriculture and the international economic crisis, the part played by cooperative organizations in the international trade in wheat, dairy produce, and certain other agricultural products, relation of labor costs to total costs of agricultural production, etc. The results of these considerations were published in the form of documents.

THE AGRICULTURAL SITUATION. Despite numerous evidences in the direction of improvement, considerable unrest continued to prevail among farming people and their organizations, with agitation for some measure of relief which would place agriculture in a more advantageous position in comparison with other industries. The passage of the McNary-Haugen Bill (See AGRICULTURAL LEGISLATION), early in the year, was a response to this feeling, and the veto message of the President was a close analysis of the objectionable features of the measure from the standpoint of economics and public policy.

Several quite extensive investigations were made of the agricultural problem by special agencies. The first of these was by the National Industrial Conference Board, a research organization of manufacturers and industrial associations, with a quite extensive report; which was followed in the summer by a study conducted by a Business Men's Commission on Agriculture, composed of representatives from the U. S. Chamber of Commerce and the National Industrial Conference Board. The latter commission advocated, among other things, gradual tariff adjustment to equalize more nearly the benefits of the protective tariff system as between agriculture and the manufacturing industry, the provision of a Federal Farm Board to assist in the stabilization of farm prices and production, a comprehensive land utilization policy, to be administered through an endowed national agricultural foundation, revision of State and local tax systems, strengthening of the rural banking system, revision of the railroad rates on farm products, and development of waterway systems.

A special committee of the Association of Land-Grant Colleges and Universities made a very extensive investigation of the agricultural situation, in which it had the assistance of forty-one experiment stations, the U. S. Department of Agriculture, various farm agencies, and a considerable number of economists. This was perhaps the most comprehensive, scientific and

unbiased investigation that has been made of the subject. The report in condensed form was presented at the annual convention of the Association of Land-Grant Colleges and Universities at Chicago in November, 1927, and published by the Association.

The report declared that "agriculture in most parts of the country is still in an unsatisfactory condition." The industry has been more prosperous in some regions than in others, a fact which has confused the public and made more difficult the statement of the agricultural situation as a whole. It is asserted that incomes from farming since 1920 have not been sufficient to pay a fair return on capital and a fair wage for the farmer's labor, or to permit farm people to maintain a standard of living comparable with other groups of like ability. The situation is recognized as complex, and there is no one line of action which will bring about universally satisfactory conditions in the agricultural industry. A large number of adjustments are required.

From the above report and other sources, some of the features of the agricultural situation and factors which have contributed to the slow and uncertain recovery may be enumerated as follows:

(1) Overexpansion of agriculture, especially in the decade 1910-20, with greatly increased acreage of staple crops since then.

(2) Continued high production of many farm commodities in the face of expanded production in foreign countries, which lessened the demand for American exports.

(3) The sudden and severe decline in the general price level, which was disproportionately heavy in many agricultural products.

(4) Inherent difficulties in rapid change or adjustment of the farming system to meet demands, due to the fact that farming is not on an annual basis, owing to necessity for rotation systems, the time required for growth and marketing of livestock, requirement of special farm equipment, etc. Unorganized competition among widely scattered individual producers results in maladjustments and violent swings in the production of certain commodities.

(5) High marketing, distribution, and processing costs, which have persisted since deflation and increased in some cases, accentuating the wide margin between producers' and consumers' prices.

(6) Recurring surpluses of various crops, partly inherent in the season and partly due to overexpansion, without adequate provision for controlling or carrying such surpluses.

(7) Failure of farm expenses, labor and living costs, to decline as much as have prices of farm products, and disproportionately higher taxes. From 1914 to 1926-27 taxes increased 250 per cent, while prices received for farm products increased about 135 per cent.

(8) Attempts to utilize lands for crop production and home making which are much better adapted to forests and grazing than to general farming.

(9) A general decline in land values, accompanied by little decrease in the volume of agricultural indebtedness, resulting in a disproportionate decline in the farmers' equity. This, combined with the low current income, has increased the number of farm bankruptcies from 1.4 a year per 10,000 farms in 1904-13 to 12.2 per year in the past three years.

(10) Movement of people away from farms, a decline in farm population of more than 2,000,000 persons since January, 1922, shared in by all States except some in New England, and California, Washington, and Nevada in the West.

The report of the special college committee not only set forth the situation, but made numerous recommendations. It considered that "agricultural legislation is a far broader question than a single Act of Congress designed to alleviate the present situation, and that such legislation should provide for equalization with reference to such matters as taxation, tariff, and freight rates, provide for a sound land policy, and further improvement of credit facilities." It urged that legislation designed to aid in emergencies should be adopted in advance of such emergencies and should terminate as an emergency ends. A far-sighted land policy should recognize the lack of present need to develop more land for agricultural uses and the advisability of turning land of low productivity back to forests and other purposes; hence the report disapproved of further Government reclamation projects for the present. It pointed to the need of equalizing the tax burden in the case of each State, the recognition of short-term and immediate credit problems, and special efforts to overcome the obstacles to further agricultural co-operation.

FARM RELIEF. The McNary-Haugen Bill in somewhat modified form, but still containing the equalization feature, was re-introduced in Congress in December. Other measures were proposed and discussed during the year. The Secretary of Agriculture, in his Annual Report, expressed the belief that a large part of the farm problem must be solved by individual and coöperative efforts of the farmers themselves; and that, while the individual farmer has no control over price-making forces, united action is possible and is the greatest single need of agriculture. Legislation is required to give further encouragement to large agricultural business organizations owned and controlled by farmers and managed by strong business executives chosen by the producers.

The Secretary proposed a stabilization plan (*The Official Record*, U. S. Department of Agriculture, Nov. 9, 1927), headed by a Farm Board backed by more adequate statistical service and a revolving fund from which advances could be made to commodity organizations. This board would operate in conjunction with a stabilization corporation for each major commodity, the capital stock of which would be owned by properly organized commodity coöperatives. When an exceptional season resulted in a crop surplus, the stabilization corporation representing that crop, under the guidance of the Farm Board, would take part of the surplus off the market to prevent the price from dropping to an abnormally low level. In making purchases for this purpose, the stabilization corporation, acting under the direction of the Farm Board, would ascertain and announce the maximum price which it could pay without taking undue risk of losing money. To finance the transaction, 65 to 75 per cent of the purchase price would be borrowed from Intermediate Credit Banks on produce stored in warehouses bonded by the Federal government, and the balance advanced by the Farm Board out of

its revolving fund, to be repaid when the product was sold after the price had recovered.

The operation of the plan is illustrated by the cotton crop of 18,000,000 bales in 1926, caused partly by increased acreage but largely by favorable weather conditions, which was more than 5,000,000 bales above the average of the preceding three years. Owing to the necessity of farmers to meet the demands of creditors, over 60 per cent of the crop was marketed from October to January at slightly less than 11 cents a pound, while later the price rose to above 20 cents. As a result, the record-breaking crop of 1926 brought farmers some \$300,000,000 less than the value of the smaller crop of 1927. In such a crisis, a stabilization corporation could have operated to great financial advantage to the producers, and with a probable resulting profit to the corporation after carrying charges had been paid.

The effect of the stabilization plan would have been to help automatically to stabilize acreage, through the influence of coöperatives owning the respective stabilization corporations. Surpluses resulting from overproduction through expanded acreage require readjustment by change in the farming system, the substitution of other crops, or the expansion of markets. The large coöperatives would be able to assist their members in making such adjustments.

THE CROP YEAR. Although unfavorable weather delayed planting and the season started under discouraging conditions, the gross production of the principal crops was 3.3 per cent greater than the average during the last ten years. It was, however, 2.2 per cent less than in 1926. Crop production per capita was declining, being 3.4 per cent less in 1927 than in the previous year, and 4.8 per cent below the average for the last ten years. The acreage of the principal crops increased slightly, and although the yields were lower than in 1926 the average was 2.5 per cent above the ten-year average. The total value of about fifty crops in 1927 was estimated by the Department of Agriculture on the basis of December prices at \$8,428,626,000, compared with \$7,793,480,000 for the same crops in 1926. This represented an increase in value over the preceding year of \$635,146,000, the largest increases being in corn, cotton, barley, and oats. There was a considerable decrease in the value of potatoes, and smaller ones in the case of wheat, hay, apples, peaches, and some minor crops.

The 1927 corn crop was estimated at 2,786,000,000 bushels, or 94,061,000 bushels (about 3 per cent) more than in 1926. This production was the greatest surprise of the season, because a late start and slow growth made it seem probable that much of the corn crop would be caught by frost. The increased production was not uniform the country over, there being a decrease in some sections, particularly in the eastern corn belt and the North Atlantic States. About 69 per cent of the crop was produced in the twelve corn belt States. The farm value of the crop was placed at a little over \$2,000,000,000, or \$285,000,000 more than in 1926.

The final estimates placed the 1927 wheat crop at 871,691,000 bushels, or about 41,000,000 bushels greater than in 1926. The winter wheat production in 1927 was below the relatively large crop of 1926, but the spring wheat production was the largest since the record year of 1918. The total farm value of the wheat crop was

placed at \$974,694,000, which compared with \$995,954,000 in 1926.

Cotton production was estimated at 12,789,000 bales, compared with 17,977,000 bales in 1926. In value, the lint and seed were worth \$331,000,000 more than the record crop of 1926, an increase of 29 per cent.

Oats had a poor start and the crop showed a decline compared with 1926, although the total value was somewhat greater.

Barley was seeded on a largely increased acreage, and the yield per acre was considerably above that of 1926, resulting in an increased production of some 80,000,000 bushels. An advance in price of nearly 10 cents per bushel made the value nearly \$74,000,000 greater than the previous year. The increasing popularity of barley as a feed crop was shown by the fact that acreage increased in practically every State where it is grown.

There was an increase in the rye crop and in its value, compared with 1926.

The production of flaxseed, estimated at 26,583,000 bushels, was the largest since 1924, and its value was about \$12,000,000 greater than in 1926.

Rice production declined 1,500,000 bushels, and due to a decline in price the value fell off approximately \$8,000,000 below that of the preceding year.

The potato crop of 402,000,000 bushels was about 48,000,000 bushels larger than the relatively short crop of 1926. Its value, however, was about \$113,000,000 less, owing to the lower price. The greatest decline in value occurred in the Northwestern States, where an unusually large crop was planted.

The tobacco crop was estimated at 1,237,832,000 pounds, a reduction of about 60,000,000 pounds from last year. The increase in the bright flue-cured districts of the eastern seaboard was more than offset by heavy reductions in the air-cured and fire-cured districts of the Mississippi Valley and Virginia, and less important reductions in some of the cigar districts. The average price was higher, making the value of the crop \$266,356,000, or approximately \$30,000,000 greater than in 1926.

The crop of tame hay was the largest ever produced, being estimated at 106,219,000 tons, as compared with 97,622,000 tons in 1924, the previous record crop. The farm value was placed at \$1,206,650,000, or about 1 per cent below the value of the smaller 1926 crop. The crop of wild hay was nearly double that of 1926 and was the largest since 1923.

The apple crop was approximately one-half that of 1926, but was valued at only about 4 per cent less. The peach crop showed a decline in size and in value, more than half the decrease in value occurring in California, where nearly 3,000,000 bushels were lost because of local marketing conditions.

Good conditions prevailed in the cattle and sheep industries, and the dairy industry enjoyed another good year. Conditions were relatively unfavorable for the swine industry from the standpoint of prices, due primarily to a sharp decline in the foreign demand for American pork and pork products.

See also individual crops, **HORTICULTURE; LIVESTOCK AND DAIRYING.**

Record export shipments of cotton and fruit, and substantial increases in exports of wheat,

rice, and rye, with the mentioned marked decline of pork products, featured the American foreign trade record for the year. Quantities were higher than in any year since 1921-22, but lower prices caused comparatively low returns. Agricultural products constituted 42 per cent of export values, as compared with 48 per cent in 1924-25. The tendency continued for imports of dairy products to exceed exports. Exports of condensed and evaporated milk declined 20 per cent. Butter prices abroad were consistently lower than in the United States, the margin at times exceeding the 12 per cent tariff and resulting in imports.

AGRICULTURE ABROAD. Estimates of the wheat production as reported December 21 for 39 countries amounted to 3,410,000,000 bushels, as compared with 3,297,000,000 in the same countries in 1920, an increase of 3.5 per cent. These countries in 1926 produced 96.4 per cent of the total world crop, exclusive of Russia. The first official Argentine estimate was 240,000,000 bushels, compared with 221,000,000 in 1926, while the official estimate for Australian production was 115,000,000 bushels, compared with 161,000,000 last year. European wheat production, exclusive of Russia, was given as about 4 per cent above last year, but the increase was offset by poor quality.

Potato production was about 22 per cent above that of 1926.

Returns for England and Wales showed an increase of 44,000 acres of wheat, but a considerable decrease in barley and oats. An outstanding feature of the returns was the increase of 96,000 acres in sugar beets, which comprised over 221,000 acres, or four times that of 1925. The potato acreage exceeded 500,000 acres, being nearly 15,000 acres more than in 1926. Cattle raising was on the increase, the returns showing nearly 22,000 more than in 1926, and the largest total ever recorded. Milch cows continued to show an increase, thus adding to the surplus over the needs of consumption as liquid milk. The number of sheep continued to increase as in recent years, although at a less rate, and the pig population had grown nearly half a million, encouraged by the embargo on pork from the Continent.

This increase in livestock farming was reflected in other European countries. Agriculture in France was going through quite drastic readjustments, shifting to a larger extent from cereal production to animal husbandry. Efforts likewise were being made in Germany to stimulate the production of livestock and livestock products at the expense of intensive cereal production. The numbers of hogs and cattle in that country were about 86 and 93 per cent, respectively, of the pre-war level. In Italy, on the other hand, Mussolini was urging increased cereal production to the point where the country would be self-supporting. A "back to the land" movement was under way, and the rural population of Italy was reported to have increased 1,178,731 in the last decade. The total rural population was estimated at something over 10,000,000, more than a fourth of the total population of the country.

A report on the status of agriculture in Persia issued during the year (*Experiment Station Record* 56, page 104) shows the backward condition and the handicaps to be overcome in developing a prosperous agriculture. The report is the result of a survey by J. B. Knight, undertaken at the instance of the League of Nations

AGRICULTURE

PRODUCTION BY COUNTRIES IN 1926 AND 1927 OF WHEAT, RYE, OATS, BARLEY, AND MAIZE IN BUSHELS

[illegible]

to determine possibilities of substituting other crops to replace the culture of the opium poppy, which had become a principal enterprise in certain sections.

WORLD AGRICULTURAL CENSUS. Under the direction of the International Institute of Agriculture at Rome, a world agricultural census was arranged to be taken in 1920-30. This was the first attempt of the kind and its importance is evidenced by the fact that, of the 200 countries listed by the Institute, only 60 had ever taken an agricultural census and only 40 of these had taken one since 1900.

WHEAT POOLS. An International Wheat Pool Conference held at Kansas City, Missouri, advocated a world wheat pool and endeavored unsuccessfully to commit the Secretary of Agriculture to the plan. While in favor of market stabilization through pooling, he believed this should be tried out first in the United States before giving it international scope. Plans for an American pool were under way, to be financed with Governmental aid or support.

In Canada, wheat pools organized in 1923 had been very successful and had a membership of nearly 140,000 farmers in the three prairie provinces of Manitoba, Saskatchewan, and Alberta. These pools collect the grain and turn it over to the central selling agency known as the Canadian Co-operative Wheat Producers, Ltd. During the crop year 1926 this central selling agency handled more than 215,000,000 bushels of grain, mainly wheat, but including oats, barley, rye, and also flaxseed. The provincial wheat pools handled more than 56 per cent of the entire wheat crop of Western Canada, the returns aggregating \$271,500,000. The overhead selling cost of the central agency amounted to one-fifth of a cent per bushel. These pools own and lease large terminal elevators and have complete control of the members' wheat from the time of delivery to the country shipping point until it is turned over to the central selling agency. Members sign a five-year contract binding themselves to deliver to the pool all the wheat they produce. These contracts form the foundation of the organization. All existing contracts terminated with the 1927 crop. These pools were developing a broad service for their members, and were giving the producers of grain the savings of large-scale operations and efficient management.

AGRICULTURAL MACHINERY. The increasing use of power and machinery on the farm has been a large factor in increasing the efficiency per man. Since 1920 the number of tractors, automobiles, stationary gas engines, and other appliances for power farming have shown tremendous growth, with consequent reduction in the number of work animals. This has released for other uses 15,000,000 to 20,000,000 acres of crop land formerly required to grow feed for work stock. In five years the increase in mechanical horsepower on farms was estimated as five times as great as the decrease in animal power.

Power machinery, besides increasing the productivity of the individual worker, tends to increase the size of the individual farms and influence the distribution of crops and the type of farming. The latter is illustrated by the movement of corn production westward and northward, and still more strikingly in the case of wheat. Lower production costs, made possible by power machinery, tend to push crop production farther west into the semi-arid sections and

into regions where conditions necessitate specialized farming. It is prophesied that the type of agriculture suited to power cultivation will be more and more concentrated in relatively level areas where large farms are practicable, leaving the older regions to concentrate increasingly on diversified farming.

A well-nigh revolutionary advance is the spread of the so-called "combine," which both cuts and threshes the wheat as it travels over the field, reducing the labor requirements, the time, and the cost of harvesting grain to a fraction of what it formerly was. In the days of the sickle and oxen, more than three hours of man labor were required per bushel of wheat; the modern binder reduced this to about ten minutes per bushel, and the combine has nearly cut that in half. In 1927 a large part of the grain in many sections where expansion is taking place was harvested by the combine. Half the wheat in Kansas was harvested by that means. The number of combines in that State had increased rapidly, up to over 12,000 in 1927, and the spread had been quite general in other States, even extending eastward. In Illinois more than 300 combines were in use, and the machine had been introduced into Pennsylvania, Delaware, and Virginia.

BIBLIOGRAPHY. Two books on general agriculture which appeared during the year are especially worthy of mention. The first of these is *The Farm—What Nature Has Done to Make Farming Possible, What Farming Must Do to Make it Profitable and Permanent, What Interest Society Must Take in the Enterprise*, by Eugene Davenport, former Dean of Agriculture of the University of Illinois. (New York, 1927.) The other is *The Evolution of the English Farm*, by M. E. Seebohm (London, 1927), a popular introduction to the history of English farming from the Stone Age to the twentieth century.

AGRICULTURE, UNITED STATES DEPARTMENT OF. Dr. William Marion Jardine of Kansas, in 1927 continued to be Secretary of Agriculture, with Renick W. Dunlap as Assistant Secretary. Dr. Leland O. Howard, in the service of the Department since 1888, retired as Chief of the Bureau of Entomology Oct. 11, 1927, and was succeeded by Dr. C. L. Marlatt, the associate chief. Dr. E. W. Nelson, Chief of the Biological Survey, retired May 9, 1927, and was succeeded by Paul G. Redington, assistant chief of the Forest Service. Dr. Milton Whitney, chief of the Bureau of Soils until June, 1927, died Nov. 11, 1927. A Bureau of Chemistry and Soils, including the research work of the former bureaus of chemistry and soils and the fixed nitrogen laboratory, was established July 1, 1927. Dr. Henry G. Knight, dean of the College of Agriculture of the University of West Virginia, became chief of this new bureau October 1. A Food, Drug and Insecticide Administration was established July 1, 1927, and put in charge of W. G. Campbell, Director of Regulatory Work. It will enforce the food and drugs, tea inspection, insecticides, naval stores, milk import and caustic poison acts. On June 30, 1927, the personnel of the department was 21,661, of whom

4791 were located in Washington. Plans for a group of large new buildings for the department were approved, under the public buildings act of May 25, 1926.

The report of the Secretary for 1927 dealt to a considerable extent with the economic problems of agriculture in the United States, including coöperative marketing, national farm legislation, the tariff, taxation, land utilization and movements of population.

COÖPERATIVE MARKETING. The division of coöperative marketing organized in the Bureau of Agricultural Economics under the Act of July 2, 1926, worked as a fact-finding agency regarding the organization and operations of coöperative associations dealing with cotton, grain, livestock, milk, fruits and vegetables. Coöperative associations reporting to the department in 1926 had about 2,000,000 members and transacted about \$2,500,000,000 worth of business, which was only a slight increase above that of 1925. The associations were, however, increasingly efficient and stable. Large-scale organizations were more prominent and were favorably considered by the department. More than 150 coöperative associations in the United States each handle business exceeding a million dollars annually. Congress passed an act prohibiting boards of trade or similar organizations from excluding from their membership and privileges representatives of coöperative associations or producers' organizations acting for a group of such associations.

RECENT REGULATORY LAWS. The following laws gave additional regulatory functions to the department: (1) Act of Feb. 15, 1927, to regulate the importation of milk and cream; (2) Act of Mar. 4, 1927, to safeguard the distribution and sale of certain dangerous caustic or corrosive acids, alkalies and other substances; and (3) Act of Mar. 3, 1927, to prevent the destruction or dumping of farm produce by commission merchants and to require them to account correctly for all farm produce received by them.

ROADS. During the fiscal year ended June 30, 1927, 8306 miles of road were completed under the Federal Road Act of Nov. 9, 1921, making a total of 64,209. The total cost of the projects completed during the year was \$182,770,000, of which \$81,330,000 was paid by the Federal Government. The total Federal-aid funds apportioned to the States during 11 years was approximately \$763,000,000. With Federal funds of the Bureau of Public Roads 452 miles of forest roads were completed during the fiscal year 1927, making the total 3498.

EXPENDITURES. For the fiscal year 1927 the total expenditure for the regular work of the department was \$47,037,961. Approximately \$10,600,000 was used for research; \$2,400,000 for extension work; \$9,000,000 for eradication or control of plant and animal diseases, insects and other pests; \$15,000,000 for service activities, and \$10,000,000 for regulatory work. Funds amounting to \$8,509,673 were received and deposited in the Treasury, of which \$4,652,565 was from business in the National forests. The other funds administered by the department aggregated \$106,049,018, of which \$92,072,566 was for Federal-aided roads and forest roads and trails; \$2,880,000 for experiment stations under the Hatch, Adams and Purnell Acts; \$5,880,000 for extension work under the Smith-Lever Act; \$1,299,090 for local road and school purposes,

and \$1,001,290 for forest purchase and conservation under the Weeks Act.

APPROPRIATIONS. The Appropriation Act of 1927, for the fiscal year ending June 30, 1928, carried \$128,511,739, of which \$77,500,000 was for roads. The amount available for the regular work of the department was \$47,186,739. To this must be added permanent appropriations, including \$4,580,000 for extension work under the Smith-Lever Act, \$3,000,000 for meat inspection, \$1,920,000 for experiment stations under the Purnell Act, and \$3,771,250 for various forestry purposes. The total available for the department in 1928 was \$139,862,989.

PUBLICATIONS. For the fiscal year 1927 the department issued 574 new publications, 299 numbers of six periodicals and 580 reprints, in total editions of 28,871,920 copies, of which 11,360,952 were *Farmers' Bulletins*. The Yearbook for 1926 contained a large number of short articles covering a wide range of subjects, under the title "What's New in Agriculture," together with statistics of crops, livestock, forestry, imports and exports, farm prices, farm property and income, cost of production, farm population, etc.

RADIO SERVICE. On April 1, 1927, there were 1,251,186 radio sets on farms in the United States. More than 100 commercial stations were broadcasting the department's programmes in October, 1927. These programmes included Aunt Sammy's daily housekeepers' chat, noontime farm flashes, poultry chats, insect and wild-animal allies and enemies, farm news digest, young folks' programme, primer for town farmers, and the United States radio farm school.

The department library contained about 217,000 books, pamphlets and bound periodicals, of which about 17,600 were added during 1927.

AIKENS, CHARLES THOMAS. President of Susquehanna University, died at Selinsgrove, Pa., June 21. He was born at Siglerville, Pa., Dec. 14, 1862, and graduated from the Missionary Institute at Selinsgrove in 1883. He received the degree of A.B. from Pennsylvania College in 1885 and that of A.M. in 1888 when he graduated from the Theological Seminary at Gettysburg, Pa. He was ordained to the Lutheran ministry in 1880, becoming pastor at Pinegrove, Pa., in that year and serving there until 1905, when he became president of Susquehanna University, Selinsgrove, Pa. In addition to his educational interests he was president of the Selinsgrove Realty Company, and an official of various other companies. He was a delegate to the Republican National Convention of 1916 and a member of the Electoral College for Pennsylvania in the same year. From 1897 to 1901 he was president of the Synod of Central Pennsylvania, and in 1895, 1913 and 1917 a delegate to the General Synod. He was also president of the Selinsgrove Chamber of Commerce, president of the Susquehanna Trail Association, and chairman of the Eastern State Hospital Commission of Pennsylvania.

AIRCRAFT CARRIERS. See NAVAL PROGRESS.

AIRSHIPS. See AERONAUTICS.

ALABAMA, POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 2,348,171. The estimated population on July 1, 1927, was 2,549,000. The capital is Montgomery.

AGRICULTURE. The following table gives the

acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1927	2,968,000	47,456,000	\$43,660,000
	1926	2,825,000	45,765,000	\$4,781,000
Cotton	1927	3,225,000	1,200,000	114,000,000
	1926	3,651,000	1,498,000	80,143,000
Peanuts	1927	220,000	149,600,000	5,086,000
	1926	140,000	79,800,000	3,591,000
Sweet potatoes	1927	75,000	7,850,000	6,248,000
	1926	65,000	6,500,000	5,525,000
Hay	1927	697,000	531,000	7,981,000
	1926	545,000	517,000	9,284,000
Potatoes	1927	83,000	2,475,000	3,712,000
	1926	29,000	2,050,000	3,857,000
Oats	1927	101,000	1,768,000	1,238,000
	1926	107,000	2,854,000	1,601,000
Peaches	1927	540,000	810,000
	1926	1,159,000	1,275,000

* bales, * pounds, * tons.

MINERAL PRODUCTION. Production of the State's chief minerals, coal and iron ore, was somewhat heavier in 1925 than in 1924, and coal production further slightly increased in 1926. Quantity totals of coal produced were: 1926, 20,008,638 net tons; 1925, 20,004,395 tons; 1924, 19,130,184 tons. Coal produced was valued, for 1926, at \$48,036,000; 1925, \$42,442,000; 1924, \$44,756,000. Iron ore production, in quantity, was: 1926, 6,871,412 long tons; 1925, 6,981,081 long tons; in 1924, 6,567,596 long tons. In value, it was: 1926, \$13,846,656; 1925, \$14,134,667; 1924, \$13,957,551. Blast furnaces produced of pig iron, in 1926, 2,875,534 long tons; and in 1925, 2,910,370. The value produced was, for 1926, \$58,119,260; for 1925, \$57,777,275. Coke production in 1926 was about 5,375,000 short tons; in 1925, 4,760,491 short tons valued at \$16,801,841. Cement production was, in barrels, 6,693,900 in 1926, 6,045,967 in 1925; in value, \$10,825,421 in 1926 and in 1925, \$9,824,439. Clay products, lime, sand and gravel and stone continued to be produced in important amounts. The total value of mineral products in 1925 was, with duplications eliminated, \$77,139,340; in 1924, \$77,315,758.

FINANCE. As reported by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State in the year ending Sept. 30, 1926, were \$14,268,973; per capita, their rate was \$5.66. They included \$4,127,174 for education. Interest payments were \$1,265,013; public service enterprises cost \$33,858; permanent improvement outlays, \$10,388,021. With these added totals, State payments attained \$25,955,865. Of this \$8,486,861 was for highways; for their maintenance, \$741,785, and for construction, \$7,745,076. Revenue receipts were \$19,948,374; or per capita, \$7.92. Of the revenue, the property and special taxes yielded 40.7 per cent. Their per capita rate was \$3.22. Earnings of departments and compensation paid the State for officials' services supplied 20.9 per cent of revenue; licenses, chiefly on companies and on motor vehicles, supplied 23.8 per cent. Net State indebtedness on Sept. 30, 1926, was \$34,439,224, or \$13.67 per capita. Property subject to ad valorem taxation had a value of \$1,071,205,516. State taxes levied were \$6,962,836, or \$2.76 per capita.

TRANSPORTATION. The total mileage of railway lines under operation Dec. 31, 1926, was 5184.19. During 1927, 28.85 miles of new track was built.

EDUCATION. The passage by the Legislature of the unified education bill carried appropriations to the approximate amount of \$5,000,000 a year. Equally important in the educational development of the State was the legislative proposal of a constitutional amendment to provide \$20,000,000 of State money for school construction (see *Legislation*). According to the estimate of R. W. Cowart of the State Education Association, in the *Journal* of the National Education Association, the seven months' minimum school term was guaranteed by State legislation providing in effect more than \$3,700,000 a year of increased school operating funds. For the school year ending Sept. 30, 1926, the school population was estimated at 871,701, reckoning all between the ages of 6 and 20 years, inclusive. School enrollment was 590,405; that in common schools being 485,412 and that in high schools 104,993. Expenditure of the year for school education was \$18,360,715. The salaries of teachers averaged \$655.

CHARITIES AND CORRECTIONS. The State Board of Administration acts as the central State organization in the field of welfare activities. It directs the hospitals, insane asylums and child welfare institutions of the State, and has supervised the employment of prisoners under the convict leasing system. Its report is issued quadrennially, to coincide with the sessions of the State Legislature.

LEGISLATION. The legislature held a special session of six legislative days, ending January 4, in which there was voted a constitutional amendment for submission to popular vote on April 12. This amendment provided for the financing of further State highway work by the issue of \$25,000,000 of bonds, and for a gasoline tax of 2 cents a gallon, in part to meet charges on this debt if issued and in part to provide funds for the removal of convicts from compulsory mine labor. On January 12, the Legislature reconvened, beginning its regular quadrennial session. A law was passed making an emergency appropriation of \$600,000 in order to render effective during the current year a plan to supply to public schools sufficient State aid to enable them to give instruction for a minimum of seven months annually. A measure for the expenditure of \$5,000,000 to carry out the improvement of the port of Mobile, where State docks were being brought to completion, was enacted, and was signed by Governor Brandon as his last official act, January 17. Legislation to terminate the convict leasing system in force in the State, at the end of the calendar year, and to permit transfer of convicts from county to State custody, was passed. Measures to meet a demand for higher State revenue, which were enacted, included a 15 per cent sale tax on cigars and cigarettes, which went into force October 2. An act providing for submission to the voters on Jan. 10, 1928, of a constitutional amendment to permit issue of \$20,000,000 of school improvement bonds and another to place before the people on Dec. 13, 1927, an amendment to empower counties to borrow up to 1½ per cent of assessed valuations likewise passed. The session adjourned September 2.

POLITICAL AND OTHER EVENTS. At a special election held December 13, a decisive adverse popular vote defeated a constitutional amendment authorizing increased taxation by numerous municipalities of the State. Nine other

amendments, one authorizing Jefferson County to build a tuberculosis sanatorium, were likewise defeated. A State commission having conducted an investigation of the State's rights in the Muscle Shoals development reported, March 18, that the United States had never acquired and under the State constitution could not acquire ground in Alabama over which the Tennessee River flowed. Governor Graves and members of this commission went to Washington, and declarations of the State's claims were there presented to Administration officials, the contention being that, if the Wilson Dam and power sites were turned over to private operation, Alabama should derive profit. Assistant Attorney-General Parmenter reported against this claim December 31. Counsel for C. R. Bachelor, a defendant under sentence of death, contended in the State Supreme Court that he could not be executed, a statute making execution by the electric chair obligatory having failed to provide for the case of defendants sentenced to hang before this statute had gone into effect. The Court, in the matter of the constitutionality of the appropriation to insure a seven months' term for every pupil, declared the law to that effect valid. In another decision, it sustained a lower court to the effect that the character of a man was not protected by law from defamation by a woman, and refusing damages for such defamation. The disclosure of numerous cases of flogging of unpopular persons, inflicted by bands of individuals in Crenshaw County, led to the indictment there of some 102 persons, in October, including an alleged former high official of the Ku Klux Klan. Some of the cases were prosecuted by Attorney-General McCall. Juries, however, acquitted, in November, the first two defendants tried, and the prosecutions were abandoned. In Blount County seven floggers who admitted membership in the Klan were convicted and sentenced after pleas of guilty had been entered by the first three brought to trial.

OFFICERS. Governor, Bibb Graves; Lieutenant-Governor, W. C. Davis; Secretary of State, John Brandon; Treasurer, W. B. Allgood; Auditor, Sidney H. Blain; State Superintendent of Education, R. E. Tidwell; Attorney-General, Charles C. McCall; Commissioner of Agriculture and Industries, S. M. Dunwoody.

JUDICIARY. Supreme Court: Chief Justice, John C. Anderson; Associate Justices, William H. Thomas, A. D. Sayre, Ormond Somerville, Lucien Gardner, Virgil Bouldin and Joel B. Brown.

ALABAMA, UNIVERSITY OF. A State institution for higher learning at University, Ala.; founded in 1831. For the autumn term of 1927 there were 2614 students, enrolled as follows: arts and science, 1468; engineering, 316; law, 126; medicine, 88; graduate, 35; education, 90; commerce, 491. The summer session registration was 2311. The faculty for 1926-27 numbered 112, of whom 7 were newly appointed. The productive funds of the University amounted to \$1,726,948.36, and the income for the year was \$655,759.29. The library contained about 75,000 volumes, of which 20,000 were government documents. A new commerce building was under construction during the year at a cost of \$200,000. President, George H. Denny, Ph.D., LL.D.

ALASKA. The fiscal year 1926-27 was marked by somewhat improved conditions. The balance of trade in favor of the Territory in-

creased \$18,655,742; the fisheries yielded \$19,160,000 more than the previous year; furs also increased in value by \$346,000; the treasury balance at the end of the year was \$1,195,000. While the mineral output decreased owing to reduced price of copper, the gold product increased, especially from placers mined by dredges.

Congressional legislation was beneficial. The act that authorized the appointment of commissioners, to reside in Alaska, and exercise certain delegated powers of Federal departments, materially facilitated public business. Three cities were given power to issue bonds for welfare purposes. Illiterates were debarred from registration as voters. An important law was that which provides for the protection, development, and utilization of the public lands, by establishing an adequate system for grazing livestock thereon.

COMMERCE. The shipments to the United States for the fiscal year were \$80,018,034, an increase over the previous year of \$18,946,167. The shipments into the Territory were \$32,062,902, leaving a balance of trade in favor of Alaska of \$47,955,132, an increase over 1925 of \$18,655,742.

FUR SEALS. The seal herd steadily increases as shown by the census which gave the following numbers: 1924, 697,158; 1925, 723,050; 1926, 761,281; 1927, 808,870. Especially noticeable was the increase in breeding cows, from 185,914 in 1922 to 244,144 in 1926. Regulations remained unchanged for the protection of fur-seals, sea otters, sea lions and walrus. On the seal reservation, Pribilof Islands, there were trapped in 1926-27, 728 blue and 30 white foxes. At public auction during the year there were sold skins of 468 blue foxes for \$24,741, an average of \$53.20 per pelt.

FISHERIES. Great activity in the fishing industries was indicated by increases of 11 per cent in investments, 36.5 per cent in products, and of 367 additional employees. In general the catch was phenomenal, and in value aggregated \$54,669,882. The distribution in species was salmon, \$48,178,995; herring, \$3,354,489; halibut, \$1,622,534; whale, \$679,754; clams, \$254,236; cod, \$78,317; crabs, \$61,616; miscellaneous, \$44,013. There were off-shore catches not landed in Alaska of more than \$400,000. There were increases in the catch of whales and halibut, otherwise decreases.

SALMON. As usual the value of the salmon industries was nearly 90 per cent of the whole catch; of this amount 98 per cent was canned salmon. The output consisted of 6,652,882 cases, valued at \$46,080,004 in 1926, as against 4,459,937 cases and \$31,989,531 in 1925. This pack of 1926 exceeded by more than 47,000 cases the unusual output of 1918. The salmon catch of 1926 numbered 96,907,627, distributed by species as follows: Coho or silver, 2,158,141; chum or keta, 10,809,305; humpback or pink, 52,960,642; king or spring, 588,637; red or sockeye, 30,390,902. Chums and kings decreased, the other species increased. The general increase in the catch was due chiefly to the large run of humpbacks in central Alaska, and of reds in the western waters. Returns as far as received indicated a marked decrease in the salmon catch of 1927.

COMMUNICATIONS. *Alaska Railroad.* This system consists of a line from Seward, on the Gulf of Alaska, to Fairbanks, with branches in

the Matanuska valley and in the Fairbanks mining district. There is also connected with it summer boat service on the Tanana and lower Yukon Rivers, which was extended during the year 135 miles to Marshall. The railroad was still a financial burden with an annual deficit of nearly one million dollars. Revenue increased 30.6 per cent, commercial freight rising to 82,416 tons; revenue passengers decreased. Large sums were needed for completion of road and modernization of equipment.

Roads and Trails. Cooperation was established between the Alaska Road Commission, the Forest Service and the Alaskan Bureau of Public Roads. A most important extension, 165 miles from Fairbanks to Circle, was made passable for wagons in summer and bob-sleds in winter. The completed system of 10,660 miles, consists of 2810 roads, wagon, sled and tramway, and 7637 miles of trails. The system has aided in the development of all parts of the Territory and decreased freight charges largely.

Aviation. The Alaskan Legislature in 1927 recognized the economic importance of commercial aviation, and made appropriations therefor. There were under construction 20 airplane landing fields, and commercial aviation was carried on successfully by 8 planes.

Cables and Radio. The U. S. Signal Corps cable, declared by Governor Parks "to hold its position as one of the most important of the Government agencies," was interrupted in its operation for seven days and eight hours, by a whale, at a depth of 3600 feet. There were 27 Signal Corps radio stations, and 33 telegraph offices. The value of the traffic for the year amounted to \$402,343, an increase of \$22,188 over 1925, due to increasing business.

FORESTS. The investigations of the U. S. Forest Service showed that the national forests of Alaska can produce, in perpetuity, 1,300,000 tons of newsprint paper annually. Two contracts, both in the Tongass National Forest, southeastern Alaska, were awarded for private exploitation. Each project covers five billion board feet of spruce and hemlock pulp timber, with necessary water power for operation; timber sales and power licenses run fifty years. Each initial plant requires an investment of approximately \$10,000,000, and must be in operation before Apr. 1, 1932. The timber cut of the national forests in 1926 was 55,761,000 board feet. See **FORESTRY**.

GAME AND FUR. Conservative and protective measures were taken to preserve species of game in danger of extermination. The policy of restocking places without game was adopted, and various kinds were placed on islands, with marked success. Especially there were two new reservations created by executive order of Feb. 21, 1927. On the Curry Refuge, Alaska, all wild life is given full protection, except bears and wolves which may be killed under restrictions. In the Alaska Railroad refuge beavers and muskrats can neither be trapped nor killed, except under special permits. Consideration was given to the uses of some of the islands of the Aleutian Bird reservation for farming, grazing and other commercial purposes. The Alaska Game Commission was active in the enforcement of the laws, and gave consideration to such modifications as will conserve wild life. The value of the pelts of land fur-bearing animals shipped during 1926 was \$2,349,640. An open season for beaver was

provided during May, 1927, which will probably result in values for all land game in excess of three millions in 1927. To conserve useful game animals the Alaska Legislature appropriated funds for cooperation with the Biological Survey in the destruction of predatory animals.

REINDEER. The reindeer in 1927 numbered 500,000 or more, of which about 350,000 were estimated to be owned by the Eskimos. The rapid increase of the deer has raised serious problems, of breeding, grazing and commercial utilization. Through the wise action of the U. S. Biological Survey the improvement of the stock by cross-breeding with the caribou was in process on Nunivak Island and elsewhere. Methods of herd care so as to avoid diseases were formulated by the Survey and taught to many Eskimos. The question of allocating and leasing grazing lands, under a recent Act of Congress, was of the utmost importance. To make leases and grant permits are essential to prevent over-grazing, and all owners could not be contented. The commercializing of the reindeer industry was progressing rapidly, but awaits improved means of transportation and cooperative methods to aid the natives. The existing commercial companies were extending their operations and improving their equipment. Shipments by cold storage to the United States, and local canning were methods used. Shipments in recent years were 294,354 pounds in the fiscal year 1925; 710,756 in 1926; and 989,984 in 1927.

EDUCATION. The Agricultural College and School of Mines had an enrollment of 178, and agriculture, mining and home economics were the leading subjects taught. Cooperation was had with the U. S. Bureau of Mines, which continued its important supervisions of safety service, analyses and inspections.

Territorial Schools. Schools were maintained in 17 incorporated cities and one incorporated district at a cost of \$323,396; the enrollment numbered 3218, and graduates 213. In 63 districts outside of incorporated cities there were enrolled 1454; the graduates numbered 35, and the expense was \$176,470. In eight communities night schools were kept at an expense of \$2795 in training aliens for citizenship; the enrollment of 242 represented 26 nationalities; among them were 32 women. The Territorial Legislature appropriated in 1927 \$1,001,350 for educational purposes.

FINANCE. At the end of the fiscal year 1926-27 there was \$1,194,613 in the Treasury. The 13 Territorial and four National Banks had deposits of \$7,757,254; there were no suspensions during the year. In 1927 the collections for the Alaska Fund amounted to \$256,713, an increase over 1926 of \$62,020.

MISCELLANEOUS. There were no serious epidemics. For the two years 1925 and 1926 there were 646 births and 556 deaths among the whites, 780 births and 595 deaths among the natives. The insane and the indigent were cared for by an appropriation by the Legislature of \$335,100.

MINERALS. Mining industries were undergoing a change in methods, and suffered from reduction in prices, especially that of copper. The total mineral productions were \$18,220,692 in 1925; \$17,567,800 in 1926; and were estimated by the U. S. Geological Survey at \$14,445,000 in 1927. The total since 1880 was nearly \$585,000,000. **Gold.** The production of gold in recent years

has varied but slightly. The product was \$6,300,281 in 1925; \$6,707,000 in 1926; and was estimated at \$6,010,000 in 1927. The yield of gold comes about equally from lodes and placers. The introduction of dredges in placer mining, of which in 1927 there were 32 in operation, has beneficially affected the output. In 1926 the product of the placers was \$1,873,000, an increase of \$784,000 over 1925. The drought in 1927 seriously reduced the output. By far the greater amount from lodes comes from southeastern Alaska, but considerable and increasing values were being obtained in the Fairbanks district and on the Kenai peninsula. Modern installations in progress promised increased production in 1928.

Copper. While this metal yet surpasses gold in value, the product fell from \$9,489,000 in 1926 to \$7,280,000 in 1927. This decrease was due to the low price of copper in 1927, which deterred increase in production. The output was mainly from the mines of the Kennecott Company in the Copper River watershed and on Latouche Island. No ores are mined for silver, which is recovered from the copper; this explains the decrease in values of silver from \$430,500 in 1926, to \$320,000 in 1927.

Minor Minerals. The coal product, \$495,000 in 1927, was a slight increase. Practically all coal came from three mines in the Matanuska field, and one in the Healy River field. In 1926, 70,000 tons were imported. The domestic market is limited and unpromising. The only petroleum output is from the Katalla field, and is used for local purposes. Prospecting goes on but up to 1927 there had been no definite outcome. More than 20,000,000 gallons of various kinds of oil were imported during 1926. The output of other minerals, lead, platinum, quicksilver, tin, etc., varies slightly from year to year.

U. S. GEOLOGICAL SURVEY. The work of this Bureau, from whose reports the foregoing summary of mineral industries has been drawn, was prosecuted with its usual efficiency. On these surveys the development of Alaska has largely depended. Its investigations of mineral resources include an annual summary of mineral production, study of individual deposits, and the mapping thereof. In connection with the mineral researches, both geologic and topographical surveys are made. During 1926 such surveys covered areas of 7,600 square miles. The performances of its geologic surveys now cover 41.1 per cent of the total area of the Territory, while the topographic work covers 43.5. In northwestern Alaska surveys were continued to determine the possibility of petroleum deposits in the Naval Petroleum Reserve, No. 4. For the use of the Geological Survey, airplane mapping was done by the Navy in southeastern Alaska. An agent of the Survey at Anchorage transacts the work connected with the leasing of public land.

NATIVES. The U. S. Bureau of Education, through its Alaskan Division, conducts, for about one half of the natives, day schools, industrial institutions, and reindeer schools; it also maintains hospitals, gives medical relief and supervises sanitation. In the six districts the work in each is supervised by a resident superintendent. In 1926 there were 88 day schools, with an enrollment of 3616. The eagerness of the children for education is shown by the average attendance of 89.1 per cent, which on Seward peninsula

rose to 92.5. In these schools only the simpler rudiments of an education are taught. Most beneficial effects have resulted from the community work with which the teachers are charged. In 1926 the 136 teachers served a native population of 12,405. They made 83,414 visits to homes, and rendered medical assistance in 33,714 cases.

Most important was the work at the three industrial institutions, Kanakanak, with 99 pupils, Eklutna with 67, and White Mountain with 56 scholars. The schools are provided with modern tool shops, hospitals, gymnasiums, water systems and electric lighting. Practically all the work of installing, equipment and repairs is done by the students, boys and girls. In these institutions, besides class work, there is both practical and theoretical instruction in blacksmithing, boat building, carpentry, cooking, house construction, sewing and sanitation. Where it is possible there is practical gardening in raising vegetables. Applications for admission are in such numbers that it was intended to provide accommodations for 150 at each school, as soon as means were available.

AGRICULTURE. There were four agricultural experimental stations in operation. The Matanuska station, in that valley, was specializing in dairying, under such favorable conditions that the industry can be a success, when there is a large demand. The station had a herd of 40 crossbred cattle. A creamery was established in July, and from a farm near Palmer the first shipment of butter was made. Since Alaska imported 1,400,000 pounds of butter in 1927, the prospects should be good. The station of Fairbanks experimented in plant breeding. Its success with grains was shown by the crop of 60 tons of wheat; most of it was milled in the Fairbanks flour mill. Sitka devoted itself to horticulture, and demonstrated the practicability of growing many kinds of fruit and vegetables in home gardens. Kodiak had a large herd of Galloways, which subsist on the local native grasses. In southeastern Alaska there were about 400 dairy cattle, which furnish the towns with milk.

U. S. COAST AND GEODETIC SURVEY. Important survey work was done along the uncharted shores in southeastern Alaska, supplemented by tide and current observations. Magnetic and seismographic observations were regularly made at Sitka and elsewhere.

U. S. ARMY. The Corps of Engineers continued its river and harbor work. The dredging of Nome harbor was completed. Wrangell Harbor was improved, and the work on Wrangell Narrows was in progress. These improvements for the safety of navigation were supplemented by the erection of 23 aids to navigation by the Lighthouse Service. The number in operation is 765.

INCIDENTAL. A great need according to the Governor was adequate public buildings. These include a capitol, delinquent school, insane asylum, contagion ward, and tuberculosis hospital, essentials for every civilized state.

ALBANIA, al-bā'nī-ā. A geographical district in the Balkans consisting of the former Turkish provinces of Scutari and Yanina and parts of the Turkish vilayets of Monastir and Kassova. The boundaries were fixed as a result of the work of an international commission appointed in 1922, which did not complete its labors, how-

ever, until 1925. The probable area of the country is estimated at about 17,347 square miles; the population is estimated at 831,877, of whom 584,676 were Mohammedan, 158,215 Greek Catholic, and 88,987 Roman Catholic. The country is divided into eight provinces named after the chief towns. The latter, with their estimated populations are as follows: Tirana, 12,000; Scutari, 32,000; Korytza, 24,000; Elbasan, 13,000; Argyrocastro, 12,000; Berat, 8500; Valona, 6500; and Durazzo, 5000. The principal race groups are the Ghegs in the north and the Tosks in the south. Agriculture is very primitive, and large tracts of land remain uncultivated. The chief products are: Tobacco, wool, olive oil, corn, and cattle. The mineral wealth is reputed to be considerable although almost entirely undeveloped. In August, 1927, there were six concessions in Albania for the purpose of drilling for oil. The positive results obtained up to that time were not considerable, although they were sufficiently encouraging to continue the exploration undertaken, as the surveys justified the hope that a large supply of oil will be found in Albania. There are also valuable forests. A coarse native cloth is manufactured from wool, but for the most part such manufactures as exist in the country pertain to the working up of agricultural products.

In a study of Albanian trade conditions published by the United States Bureau of Foreign and Domestic Commerce in October, 1927, it was stated that the economic development of Albania has been handicapped by natural conditions—mountains, primitive roads, lack of railroads, and undeveloped natural resources. As an agricultural country, with practically no native industries, it is entirely dependent on imports of manufactured goods. The introduction of foreign goods in general has been rather slow, but imports have continued to expand during the post-war period. Exports, although still inadequate to pay for imports, have shown a greater relative increase than imports since 1921. Remittances from Albanians abroad were believed to offset to a certain extent the large adverse trade balances. Imports and exports for the years 1921 to 1926 were valued as follows:

ALBANIAN EXPORTS AND IMPORTS *

Year	Imports	Exports	Unfavorable balance
1921.....	\$3,520,422	\$422,739	\$3,097,683
1922.....	2,335,818	571,818	1,764,000
1923.....	4,520,856	1,571,026	2,949,830
1924.....	3,955,518	2,889,845	1,065,673
1925.....	4,208,880	3,112,503	1,096,377
1926.....	4,800,141	2,809,649	2,490,492

* Conversions at \$1 = 5.18 gold francs.

The fluctuations in exports are attributable to variations in the size and quality of crops, the poor yields of 1926 having been responsible for the decline in exports as compared with 1925. A forecast for 1927 of the exports for that year was expected to reflect this decreased purchasing power. The chief articles of import for 1926 were: Cotton manufactures, woolen goods, sugar, coffee, rice, machinery, kerosene, gasoline, and leather. The chief articles of export for the same year were: Cheese, grains, eggs, skins and hides, lambs, and wool. Italy buys most of the exports and supplies the bulk of the imports. The United States bought goods to the value of \$386,420 in 1926 and sold \$108,850 worth of goods in the same year.

Albania was declared an independent country by the general in charge of the Italian forces, June 3, 1917, and a provisional government was set up at Durazzo. Under the constitution adopted in 1925 there is a parliament with 54 members elected every four years and a senate of 18 members, 12 elected and 6 nominated. The president, elected for seven years by the house and senate sitting as a national assembly, enjoys about the same executive powers as the president of the United States. President at the beginning of 1927, Ahmed Zogu (elected Jan. 31, 1925).

HISTORY. Throughout the year discussions were rife concerning the Treaty of Tirana signed between Italy and Albania in the fall of 1926 (see preceding YEAR BOOK). A feeling of unrest was engendered not only in the Balkans but elsewhere in Europe. Although stoutly denied both at Rome and in Albania, there was no doubt in the minds of competent observers that this pact makes of Albania little more than a protectorate of Italy. The chief basis of this claim is the provision of the treaty which permits Italy to intervene with armed forces if their reciprocal interests are threatened by a hostile power. Needless to say this treaty was regarded in a very suspicious light by Jugo-Slavia as a direct menace aimed at her and her position in the Balkans. As will be noted in the history of that country, she made advances to practically every state in Europe to form a counter treaty to offset Italy's undoubted status in the Balkans. She approached France at first but was not at all warmly received until she flirted with Germany and her press, as well as that of Germany, revived the old Mittel Europa idea and threatened France's predominant position on the continent. After several diplomatic exchanges a treaty between France and Jugo-Slavia was signed. Thus was laid the foundation of Italo-Franco rivalry in the Balkans and many observers thought that the old Balkan powder box of the years before the World War had been refilled with tinder and was just waiting for the match to set fire to a "bigger and better" war. Time alone can tell.

The fears of Jugo-Slavia were justified to a large extent by the increasing activity taken by Italy and Italians in internal affairs, under the friendly leadership of Ahmed Zogu, the pro-Italian leader of Albania. Internal improvements, particularly connected with highways, topographical surveys, and railroads, were being carried out during the year under the supervision of Italian engineers and with Italian money loaned to Albania for the purpose. The army was undergoing a complete reorganization at the hands of Italian officers and was greatly enlarged. It was claimed in some quarters that the amount of Italian loans, with their interest and amortization charges, was greater than the Albanian budget could bear, particularly when considerably more than half of this budget was spent on military items. The modern conception of imperialism teaches that economic penetration is just as effective and far more moral than the old idea of conquest and exploitation.

In order to allay the fears of Jugo-Slavia, and at the suggestion of Italy, Ahmed Zogu offered the same terms to Jugo-Slavia that had been made with Italy, but Jugo-Slavia refused to have anything to do with him. Jugo-Slavia

wished to have the entire matter of Albania reviewed by the League of Nations, but France, Great Britain and Germany were opposed to such a scheme because of possible fear of Mussolini.

They suggested that the entire matter be ironed out by means of direct diplomatic exchanges between Rome and Belgrade. The latter capital was loath to do this, however, and the European press was very mournful because of the hesitancy of the League to act and because of the obvious possibilities of war.

A crisis between Albania and Jugo-Slavia was precipitated on June 5, when a Jugo-Slavian official was arrested at Tirana charged with espionage. The representatives of Jugo-Slavia left Tirana immediately and the Albanian representative left Belgrade under protest, on the grounds that he did not see any cause for a diplomatic break in the incident and because he thought it would be possible to settle the matter through diplomatic channels. Significantly enough the French took charge of the Jugo-Slavian affairs at Tirana and the Italians of Albanian affairs at Belgrade. The matter was laid before the League of Nations, Albania limiting her side to the question of the arrest only, while Jugo-Slavia evidently desired to have the entire matter of Albania taken up, with particular reference to the Tirana treaty. Great Britain, France, Germany and Italy suggested that the matter be settled by Albania freeing the arrested person, and that Jugo-Slavia should recall the note severing diplomatic relations. Both sides agreed to this formula and the tension was temporarily relieved. The year closed without any other untoward incident, with the exception of the murder of the brother-in-law of Ahmed, who was ambassador to Czechoslovakia, on October 14. He was known as an anti-Italian and attempts were made in the Belgrade press to lay the crime at the doors of Mussolini, despite the fact that the assassin declared he had acted in the matter entirely upon his own initiative.

ALBERTA, *ál-búr'tá*. A northwestern province of Canada, formerly consisting of a large part of the Northwest Territories; bounded on the east by Saskatchewan, on the west by British Columbia, and on the south by the United States. Area, 255,285 square miles; population (1926), 607,584, as compared with 496,442 in 1916. The rural population in 1926 numbered 374,614, and the urban, 232,970. Chief towns with their populations according to the census of 1926: Calgary, 63,513; Edmonton, 65,163; Lethbridge, 10,893; and Medicine Hat, 9536. The movement of population in 1925 was: Births, 14,924; deaths, 4693; marriages, 4355.

Agriculture is the chief occupation of the province but there are valuable deposits of coal, natural gas, and petroleum. Besides the raising of grain, livestock and dairying are the chief industries. The acreage and crop of the principal grains in 1926 were as follows: Wheat, 6,276,193 acres, 119,434,000 bushels; oats, 2,478,494 acres, 88,182,000 bushels; barley, 513,000 acres, 14,401,000 bushels; rye, 130,801 acres, 2,093,000 bushels; flax, 5000 acres, 36,000 bushels; mixed grains, 15,200 acres, 444,000 bushels. It has been reported that Alberta contains 17 per cent of the coal reserve of the world. In 1925 the output was 5,883,394 tons. In the same year the value of the natural gas output was \$2,700,025.

The total mineral production in 1925 was valued at \$25,005,718.

Executive power is nominally vested in a lieutenant-governor appointed by the Dominion government, but it is actually vested in an executive council or cabinet. Legislative power is in the assembly, which is elected by direct vote including woman's suffrage. Lieutenant-governor in 1927, Dr. W. Egbert; prime minister, John Brownlee. There were 59 members in the legislature, including 40 United Farmers; 12 Liberals; 3 Laborites; 3 Independents; and 1 Conservative. See CANADA.

ALDERSON, **LIEUTENANT-GENERAL SIR EDWIN ALFRED HEEVEY**. British soldier, died at Lowestoft, England, December 14. He was born Apr. 8, 1859, and entered the army, in the Royal West Kent Regiment, in 1878. He became a captain in 1886, and advanced through all the ranks, serving with distinction in India, in the first and second Boer Wars, in Egypt and in the Nile expedition. He became a major general in 1906 and a lieutenant general in 1914. He was chosen to command the First Canadian Division in the War, and later took command of the Canadian Corps. He won medals and other honors in virtually every campaign in which he was engaged, and became a Companion of the Order of the Bath in 1900 and a Knight Commander of the same order in 1916. He was honored by France also, with the rank of Commander of the Legion of Honor. General Alderson was an aide-de-camp to Queen Victoria and to King Edward VII. He was a noted hunter and yachtsman as well as soldier, and an author. His published works were: *With the Mounted Infantry and Mashonaland Field Force* (1896); *Pink and Scarlet, or Hunting as a School for Soldiering* (1900), and *Lessons from One Hundred Notes Made in Peace and War*.

ALDRICH, **SHERWOOD**. American copper operator, died in New York, N. Y., July 2. He was born at Riverhead, N. Y., Sept. 4, 1868, and was educated at Riverhead Academy and at public schools in Brooklyn, N. Y. He graduated from the New York University Law School in 1889, and was admitted to the New York bar. In 1890 he went to Colorado, becoming actively interested in copper mining. He served as president of the Ray Consolidated Copper Company until it was absorbed by the Nevada Consolidated Copper Company, of which he became a director and vice president.

ALEXANDER, **CHARLES BEATTY**. American lawyer, died in New York, February 7. He was born at New York City, Dec. 6, 1849, and graduated from Princeton in 1870 and from the Columbia University Law School in 1872, in which year he was admitted to the New York bar. He was connected with the firm of Alexander & Green until his retirement in 1912. He was for some time counsel and later director of the Equitable Life Assurance Society of the United States, a director of the Tri-State Land Company, a trustee of the Equitable Trust Company, and at one time a director of the Mercantile Trust Company, the Windsor Trust Company, the Hocking Valley Railroad Company, the Mount Morris Bank, the International Banking Corporation, the International Bank, and president of the Alexander Estate, Inc. In addition to his legal activities he was interested in education, and was elected a regent of the University of the State of New York in 1913; on the

expiration of his term in 1925 he was reelected for the term expiring in 1927. He was chairman of the committee on state science work and the State Museum, and member of the committees on higher education, State Library and law legislation. He was a trustee of Princeton University for many years, and from it received the degree of LL.D. in 1895. He was similarly honored by Washington and Jefferson in 1902 and by New York University in 1923, and received the degree of Litt.D. from Washington and Lee in 1913. He was a delegate to the Democratic national conventions of 1912, 1916, and 1920, and was a national adviser of the Democratic party. Alexander Hall at Princeton University was built by his wife and presented to the university in 1892. Mr. Alexander delivered many important addresses, including the one to André Tardieu, French high commissioner to the United States, Apr. 6, 1918, and he presided over and delivered the address at the annual meeting of the American Academy of Political and Social Science in the same year. He was a member of many important organizations in New York, including the State Bar Association, the Association of the Bar of the City of New York and the Chamber of Commerce; also of the Pan American Society of the United States, the Pilgrims of the United States, and various hereditary and patriotic societies, including the General Society of the Cincinnati, of which he was a vice president. For services during the World War he was honored with the order of the White Eagle, third class (Commander) by Prince Regent Alexander of the Kingdom of the Serbs, Croats and Slovenes, in 1919; with the Crown of Italy by the King of Italy, in 1920; and he was made an Officer of the Legion of Honor by the French Government in 1925.

ALFALFA. The alfalfa hay production of the United States in 1927 as reported by the Department of Agriculture amounted to 31,781,000 tons as compared with 27,575,000 tons in 1926, this increase having been due largely to a favorable season and the resulting better yields in the North Central States which produce a large proportion of the crop. The production of alfalfa seed in 1927 was much smaller than the comparatively large crop produced in 1926. Provisional estimates placed the crop for this year at 42,000,000 to 45,000,000 pounds of country run seed, or seed as it comes from the thresher, while the preceding year the production reached 57,000,000 pounds. Unfavorable weather conditions, including early fall frosts, reduced the yield to a large extent in most of the leading seed producing States especially in Kansas, Nebraska, South Dakota, Montana and Oklahoma. An increase in production reported from Idaho, New Mexico, Arizona and Texas only partly offset the decreases in the principal producing sections.

Prices for clean seed during the fall of 1927 averaged about \$14 per 100 pounds or nearly the same as the year before but somewhat higher in the sections of low production and lower in the sections of high production. Owing to later harvesting and thrashing the movement of alfalfa seed from producers' hands was delayed but was more rapid in the southwestern producing area than in the northern sections, where, due to the smaller yield, prices were higher. The highest average prices for seed of

common alfalfa in October were offered in South Dakota and the lowest in New Mexico. As usual Grimm alfalfa seed brought much higher prices than were received for seed of common alfalfa, and for good clean seed from \$25 to \$28 per 100 pounds was offered. For the year ended June 30, 1927, the imports of alfalfa seed amounted to 5,133,700 pounds, an increase of 585,400 pounds over the imports of the preceding fiscal year. The exports for the two years, as reported by the Department of Commerce, were 1,289,000 and 1,418,000 pounds respectively.

According to a notice issued by the Secretary of Agriculture under authority of the Federal Seed Act, all seed of alfalfa imported from South America must be stained an orange red color to the extent of at least 10 per cent of the seed in each container. The United States standards for alfalfa and other hay were amended by the Secretary of Agriculture as effective July 1, 1927. The class and grade requirements of alfalfa and alfalfa mixed hay are given in the *Handbook of Official Hay Standards*, United States Department of Agriculture, Washington, 1927. A decision was made during the year under the Federal Food and Drugs Act to the effect that alfalfa stems ground up cannot be classified as alfalfa meal and must be sold under a name descriptive of the article and in no way deceptive.

ALGERIA. A colony of France forming politically a part of France itself, situated in northern Africa. It comprises the two great divisions of Northern and Southern Algeria which in turn are divided as follows: Northern Algeria into the departments of Algiers, Oran, and Constantine; Southern Algeria into the territories of Ain Sefra, Ghardaia, Tougourt, and the Oases of Sahara. The total area, including the Algerian desert, is estimated at 1,069,000 square miles; population, including military forces, according to the census of Mar. 7, 1926, 6,064,865, of whom 5,552,640 were in Northern Algeria. The Europeans numbered 872,439. All but a small fraction of the population was in the towns and cities. Chief towns with their populations for 1926: Algiers, 226,218; Oran, 150,301; Constantine, 93,733 (these three being respectively the capitals of the provinces of the same name); Bone, 51,895; Tlemcen, 26,758; Sidi-bel-Abbes, 43,148; Blida, 24,758; Tizi Ouzon, 29,444; Philippeville, 29,242; and Sétif, 26,677.

The race groups in the native population are principally Arabs, Berbers, and Kabyles, and the prevailing religion is Mohammedanism. The chief Christian church is the Roman Catholic which maintains an archbishop and two bishops. In 1924 there were 1485 primary schools with 108,090 pupils. In the following year there were 16 establishments for secondary education with 9716 pupils. For higher education there is a university at Algiers, with an attendance in 1925 of 1592 students, and there are special schools of commerce, hydrography, agriculture and the fine arts. There are also higher Moslem schools at Algiers, Constantine, and Tlemcen.

PRODUCTION. Algeria possesses a small area of highly fertile plains and valleys near the coast, chiefly owned by Europeans. This region is scientifically cultivated and yields profitable returns from vineyards, cereals, etc. The remainder of the country is of limited value for agri-

cultural purposes. The northern portion is mountainous and generally better adapted for grazing and forestry than agricultural pursuits, and a large portion of the native population is very poor. The chief crops in 1925 were wheat, 3,601,101 acres, with a yield of 1,037,857 tons; barley, 3,289,368 acres with a yield of 972,458 tons; oats, 632,717 acres with a yield of 235,503 tons. Other produce includes maize, potatoes, artichokes, beans, peas, tomatoes, flax, silk, and tobacco. The yield of wine was 273,287,080 gallons from an area of 512,732 acres. The production of olive oil amounted to 5,718,942 gallons from 7,799,627 trees. See table of production by countries under AGRICULTURE.

COMMERCE. The exports in 1926 amounted to 3,129,222,000 francs and the imports to 3,533,019,000 francs. The chief exports were sheep, phosphates, wheat, wine, eggs, cigarettes, figs, and tobacco. The chief imports were sugar, petroleum, paper, clothing, automobiles, and other manufactured articles.

FINANCE. Including the supplementary extraordinary budget, the total budget for the year 1927 amounted to 895,371,968 francs revenue, and 895,358,851 francs expenditure. The chief sources of revenue in the 1927 budget were taxes of various kinds, posts, telegraphs, telephones, and stamp and other duties. The principal items of expenditure were services on the public debt, administration, education, and public works.

COMMUNICATIONS. In 1925 there were 2616 miles of railway open for traffic. The railway receipts for that year amounted to 212,908,551 francs. In 1926, 4147 vessels of 6,441,844 tons net entered and 4476 vessels of 6,833,710 tons cleared from Algerian ports. On Jan. 1, 1925, the mercantile marine of Algeria consisted of 432 vessels of 94,323 tons net.

GOVERNMENT. The central executive authority of the local government is the governor-general who directs all the services with the exception of the non-Mussulman departments of public instruction, justice, worship, and the treasury, which are each under a separate ministry. The governor-general, with the minister of the interior, prepares the budget which is voted by the so-called Financial Delegations and by the Special Council. The colony sends to the home parliament one senator and two deputies for each department. On Nov. 19, 1927, Pierre Bordes, the Prefect at Algiers, was appointed governor-general of Algeria to succeed former Gov.-Gen. Maurice Violette. The new governor-general was said to enjoy the confidence not only of the French government but of the natives of Algeria as well.

ALLEGHENY COLLEGE. An institution of higher learning at Meadville, Pa.; non-sectarian in policy but under the patronage of the Methodist Episcopal Church; founded in 1815. The enrollment for the fall of 1927 was 573, distributed as follows: graduate students, 2; seniors, 114; juniors, 110; sophomores, 164; freshmen, 183. For the 1927 summer session the registration was 89. The faculty numbered 38. The productive funds of the college amounted to \$1,400,000, and the income for the year was \$333,846. The library contained 68,000 volumes. President, James A. Beebe, D.D., LL.D.

ALLERGIC DISEASES. It had been realized for some years that there were groups of diseases which were due to the extreme sensitive-

ness of certain individuals to certain foreign substances in the air and food. When these particles are inhaled the reaction of hypersensitiveness is manifested as bronchial asthma, hay fever and the paroxysms of whooping cough, and when swallowed with the food by urticaria and other forms of eruption. Not very much is known of these substances which comprise horse dandruff, the pollen of flowers, etc. In addition to group sensitiveness there is also an individual sensitiveness or idiosyncrasy exhibited by many people toward special drugs and food articles. The particular offending substance may be recognized by diagnostic skin reactions and once this is known it is possible to diminish or abolish the sensitiveness by habituating the patient over long periods to repeated injections of minute quantities of the said substance, a tedious and uncertain process.

Quite recently a way has been found to control the respiratory group of these affections by excluding these foreign particles from the inspired air. The basic work in this direction has been carried out at the University of Leyden, Holland, by Storm van Leeuwen, W. Eindhoven, Jr., and W. Kremer (*The Lancet*, London, June 18, 1927). These observers had found that it was possible to reduce this oversensitiveness as far as bronchial asthma was concerned by injections of foreign protein (tuberculin was used), but that at least half of the asthmatics received no benefit from this resource. In place of attempts to exclude certain special irritants from the air the authors sought to rid the latter of all impurities by producing an atmospheric condition like that encountered at high altitudes. Under ordinary conditions the air contains what are termed climatic allergens (particles able to provoke asthma and other allergic diseases). Two types of these were recognized, one for out-of-door air and the other for the air of private houses (in the larger, well ventilated public buildings the air is free from these substances). The great majority of sufferers are susceptible to the last named only. The authors had constructed a series of sleeping cabinets known as allergen-proof chambers which readily could be installed in any private house, the air being purified either by refrigeration, filtration or electrical process. For two years they experimented with hundreds of patients suffering from bronchial asthma, whooping cough and tuberculosis. For some reason hay fever was not mentioned in this connection. For details see **ASTHMA and WHOOPING COUGH.**

ALLIANCE FRANÇAISE, FÉDÉRATION DE L'. An association of clubs and groups formed for the purpose of encouraging and furthering the study and cultivation of the French language, literature, art, and history in the United States. It was established in 1902, and in 1927 comprised over 250 local branches, including French Alliances, affiliated societies, and French clubs in universities, colleges, and schools. Twenty new groups were added to the Fédération during 1927. Each year the Alliance Française brings from France one or more lecturers who are prepared to speak before all the affiliated societies and clubs wishing to hear them. It also organizes lecture tours for distinguished French travelers, and for French lecturers who live in America. It assists in organizing courses in the French language and literature, in co-

operation with the leading universities, and encourages its groups to engage in dramatic performances and debates in French. The official lecturers from France during the year 1926-27 were Mme. André Alphandéry, writer and lecturer, M. Daniel Michenot, well-known journalist, and M. Maurice Pillet, archaeologist. The Assemblée Générale of the Fédération attended by representatives of the various groups was held at the Hotel Plaza, New York City, on Apr. 22, 1927. On that occasion was celebrated the 25th anniversary of the founding of the Fédération; M. Paul Claudel, the French Ambassador to the United States, presided and there were two special delegates from France: Monseigneur Baudrillart, who represented the French Academy, and M. Paul Labbé, General Secretary of the Alliance Française de Paris. The official organs of the Fédération are *l'Echo de la Fédération* and the *Bulletin Officiel*. Headquarters are at 32 Nassau Street, New York City. Officers for the year 1927 were: Frank D. Pavey, president; William Nelson Cromwell, general vice president; Albert Blum, president of the executive committee; James N. B. Hill, treasurer; Felix Weill, general secretary.

ALSACE-LORRAINE, al'zäs'lör'än'. The provinces taken from France by Germany after the Franco-Prussian War of 1870-71 and restored to France after the armistice of Nov. 11, 1918; constituting at present the three French departments of Bas-Rhin, Haut-Rhin, and Moselle. Total area, 5605 square miles, total population in 1921, 1,709,749. The area and population are distributed among the three departments as follows: Bas-Rhin (formerly Lower Alsace), 1848 square miles, and 651,686 inhabitants; Haut-Rhin (formerly Upper Alsace), 1354 square miles, and 468,943 inhabitants; Moselle (formerly Lorraine), 2403 square miles and 589,120 inhabitants. Alsace-Lorraine contains the only petroleum fields of commercial importance in France, but supplies only about 10 per cent of the total consumption. Iron ore is mined in large quantities. Potash production was affected favorably by the agreement between the Alsatian and German mines for a division of the world market. In January, 1926, the autonomy of the port of Strassburg was established.

ALUMINUM. According to the U. S. Bureau of Mines the value of the new aluminum produced in the United States in 1926 was \$37,583,100, or 3 per cent greater than in 1925, when the production amounted to \$36,430,000. The secondary aluminum production in 1926 was \$23,168,000 in value, or 4 per cent less than in 1925 when the total for the secondary metal was \$24,816,000. The secondary aluminum amounted in quantity to 20,500 short tons as metal and 23,700 short tons as the aluminum content of casting metals. The imports of aluminum into the United States, including the metal in the crude form, scrap bars, strips, plates, sheets and all manufactures, amounted to \$16,779,377 in 1926, as compared with \$10,106,767 in 1925; while the exports in 1926 were \$4,452,303, as compared with \$6,057,071 in 1925. In 1927 it was estimated that the domestic production of aluminum was greater than in 1926, while the imports continued heavy, being in excess of those for the corresponding months of 1926. There are also increased exports, both of crude aluminum and of manufactured materials, in 1927. The Aluminum Company of Canada was active

in production at its plant at Arvida in the Saguenay River Valley during the year, while in the United States there were under construction in North Carolina an important dam on the Yadkin River and also one on the Little Tennessee River to develop power so that the aluminum works in this district could be extended and difficulties derived from lack of power during time of drought eliminated. There were under construction during the year new aluminum works in France, Scotland, Norway and Italy, while a plant in Spain began operation in November. An increased market for aluminum and aluminum alloys was found in airplanes and seaplanes, where the structural parts were largely composed of aluminum alloys and the hulls and wings covered with aluminum or aluminum-alloy sheets. A new use of aluminum was in the manufacture of furniture, while aluminum was finding an increased application in railway passenger coaches, street railway cars and buses, resulting in a saving of from 15 to 40 per cent in weight; in structural and architectural work, aluminum castings and sections being more widely used; and also in the form of aluminum shingles and roofing materials. See also **BAUXITE**.

ALVEX, al-ves, Mrs. CARL. American concert contralto and teacher, died at New York, March 23. She was born at New York in 1862, and received her entire musical education from Carl Alves, a celebrated teacher, to whom she was married in 1884. After the death of her husband, in 1899, she retired from the concert stage and devoted herself to teaching. From 1905 to 1914 she lived in Leipzig, Germany. At the height of her fame she was one of the most prominent concert and oratorio singers in the United States, appearing with all the great orchestras and at all the important festivals.

ALVORD, BENJAMIN. Brigadier-General, U.S.A., retired, died at Washington, D. C., April 13. He was born in Washington, D. C., May 15, 1860, the son of Gen. Benjamin Alvord (1813-84), Paymaster-General, U.S.A., and graduated from the U. S. Military Academy in 1882. Commissioned as second lieutenant, he was with the 20th U. S. Infantry until the outbreak of the Spanish American War when he was promoted to major in the U. S. Volunteers, serving as chief ordnance officer and in other capacities. He returned to the regular service as major in the 25th Infantry, and in 1905 was made lieutenant-colonel in the Adjutant General's department, being promoted to a colonelcy in 1913 and serving in the department for the remainder of his active military service. During the Philippine insurrection he was brevetted for "conspicuous gallantry" in action against insurgent forces at Cainta, Luzon, Mar. 16, 1899. He was at various times instructor at the Infantry and Cavalry School and at West Point, adjutant-general of the Department of Northern Luzon in 1901, chief of staff in the expedition to Vera Cruz in 1904, and adjutant-general of the Western Department in 1917. At the time of the organization of the American Expeditionary Forces he was appointed brigadier-general and accompanied Gen. John J. Pershing to France as his first adjutant-general. He served throughout the War. On his return to the United States he was appointed adjutant-general of the Ninth Corps Area at San Francisco, and later assistant to the adjutant-general at the War Department

in Washington. He received the Distinguished Service Medal for exceptionally meritorious service during the War. He retired in May, 1924, and after his retirement was stationed at the Soldiers' Home as secretary of its Board of Governors.

AMERICAN ASSOCIATIONS AND SOCIETIES. For various scientific and other organizations whose official titles begin with the word American, see under the important descriptive word of the title.

AMERICAN LEGION. An organization of World War veterans chartered by Congress "to uphold and defend the Constitution of the United States; to maintain law and order; to foster and perpetuate a 100 per cent Americanism; to preserve the memories and incidents of the association in the Great War; to inculcate a sense of individual obligation to the community, state and nation; to combat the autocracy of both the classes and the masses; to make right the master of might; to promote peace and good will on earth; to safeguard and transmit to posterity the principles of justice, freedom and democracy; to consecrate and sanctify the comradeship of the members by devotion to mutual helpfulness." On Sept. 19, 1927, the membership was 712,526. The ninth annual convention was held in Paris, Sept. 19 to 24, 1927, with a delegate attendance of 1077, representing every state, the District of Columbia, five territorial and four foreign departments.

The retiring national commander, Howard P. Savage, in his annual report to the convention, cited the carrying out of the main objectives set for the year by the previous convention: community service, and the increasing of the membership by 39,297 over the previous year. The convention in Paris, which was attended by approximately 20,000 members of the Legion and members of their families, took the form of a great pilgrimage to the graves of the American World War dead in France, and of a gesture of good will to the nations of Europe. International amity was expressed at a series of elaborate entertainments and social events given by the French Government and veterans' organizations for the visitors. The convention reaffirmed the Legion's stand on the carrying out of the provisions of the National Defense Act of 1920 and the passage of the Universal Draft bill, and decided that community service should continue to be the major activity in 1928. Distinguished guests of the convention included: Gen. John J. Pershing; Marshal Ferdinand Foch; President Doumergue; Premier Raymond Poincaré; Aristide Briand, minister of foreign affairs; Paul Painlevé, minister of war; Louis Marin, minister of pensions; André Tardieu, minister of public works; Marshal Joffre; Marshal Pétain; Sheldon Whitehouse, American chargé d'affaires; and Senator L. D. Tyson, of Tennessee.

Following the close of the convention in France a group of 250 prominent members of the Legion, led by Commander Savage, carried the greetings of the American veterans to other allied countries, going to Rome, where they were received by King Victor Emmanuel III; to Brussels, where they were received by King Albert I; and to London, where King George V received them. The convention movement, which was the largest peace-time trans-Atlantic movement in history, was handled on twenty-four

official ships of five different lines. The *Leviathan*, the largest ship under the United States flag, was the flagship, carrying Commander Savage to and from the convention.

A ratification convention was held in New York City on Oct. 18, 1927, to ratify the proceedings of the meeting in Paris, which were not official because the convention was held outside of the limits of the United States. It was decided to hold the 1928 convention at San Antonio, Texas, under action of the 1926 convention at Philadelphia, Pa. *The American Legion Monthly*, with offices at 2457 East Washington Street, Indianapolis, Ind., was the official publication of the organization. The American Legion Auxiliary, composed of mothers, wives, sisters and daughters of Legion members, and *La Société des 40 Hommes et 8 Chevaux*, the fun-making branch of the Legion, both of which have national headquarters in the War Memorial Building at Indianapolis, cooperated in the activities of the Legion during the year. The officers elected for the year of 1927-28 were: Edward E. Spafford, New York, National Commander; J. M. Henry, Winona, Minn., Ralph T. O'Neil, Topeka, Kan., James T. Raftis, Colville, Wash., Paul R. Younts, Charlotte, N. C., and Dan Spurlock, Shreveport, La., Vice Commanders; James F. Barton, Fort Dodge, Ia., Adjutant; the Rev. Gill Robb Wilson, Trenton, N. J., Chaplain; Eben Putnam, Wellesley Farms, Mass., Historian; Bowman Elder, Indianapolis, Ind., Treasurer; Scott W. Lucas, Havana, Ill., Judge Advocate. The national headquarters were located in the War Memorial Building, Indianapolis, Ind.

AMERICAN REVOLUTION CELEBRATIONS. See CELEBRATIONS.

AMHERST COLLEGE. An institution for the higher education of men, at Amherst, Mass.; founded in 1821. For the 1927 fall term 764 students were enrolled, including: fellows, six; graduate students, eight; seniors, 140; juniors, 164; sophomores, 210; freshmen, 232; specials, four. The active faculty exclusive of emeritus and administrative officers and those on leave, numbered 69. The productive funds of the College amounted to \$7,000,000, and the income for the year was \$575,000. The library contained 151,000 books. Arthur Stanley Pease, professor of Latin, was at the June 18 meeting of the Board of Trustees elected the 10th president of the college, and inaugurated November 4.

AMMONIUM SULPHATE. See FERTILIZERS.

ANÆMIA, DIETARY TREATMENT. See FOOD AND NUTRITION.

ANÆMIA, PERNICIOUS. Minot and Murphy continued their activity in the domain of feeding patients with their diet "rich in liver" (see *YEAR BOOK* for 1926) and had treated in this manner more than 100 cases for intervals ranging from three years down to three months. At the same time Koessler and associates persisted in the use of the diet first recommended by them which was modified to include all the vitamins and not merely the fat soluble one. Wheat germ or its oil is an excellent source of vitamins A, B, D and E, and, when mixed with orange juice, which is rich in the C vitamin, all of these bodies are represented. Minot and Murphy thus far had seen no case which had failed to react favorably, while Koessler claimed that remissions set in in from eight to

14 weeks with return of the normal blood picture. The two diets do not differ in essentials, although Koessler differs from the majority in permitting considerable fat. Both papers are to be found with joint discussion in the *Journal of the American Medical Association* for Sept. 3, 1927. The dietetic principles involved in these two plans of treatment have been widely adopted by clinicians throughout the world and the general verdict was to the effect that a positive advance has been made.

The belief that vitamin deficiency of some kind is a factor in the causation of pernicious anemia led a number of physicians to apply to this affection the treatment of most service in rickets which is based on the view that lack of vitamin D is responsible largely for that condition. The particulars will be found in the article on RICKETS. Prof. G. Rosenow of the Medical Clinic of the University of Königsberg, having experienced some failures in the use of the Minot-Murphy diet, added to the latter the internal use of a newly isolated lipid substance known as ergosterin which in addition had been subject to the action of ultraviolet light. This substance which is closely related to cholesterol is regarded as one of the best sources of vitamin D. He regards the combination of a specific diet with the antirachitic vitamin as superior to diet alone and also to the former treatment with arsenic and blood transfusion (*Klinische Wochenschrift*, August 13).

ANALGESIA, OBSTETRICAL. Despite the practical insuccess of the so-called "twilight sleep" in connection with the pain of childbirth, anesthetists and obstetricians have not abated their attempts to bring about painless labor in a form capable of general application. To be ideal such a resource must be free from all danger and must also be free from technical difficulties which make it practicable only in maternity homes and in the hands of expert anesthetists and nurses. The form of obstetrical analgesia which has been carried out in the Lying-In Hospital in New York for several years is not of course to be credited to 1927 and its details have repeatedly been described in medical journals but it is only recently that an authentic account of the method has been released to the public press. In the New York Sunday World for December 4 was published a long article on the history of a method evolved and carried out by Dr. J. T. Gwathmey, pioneer in and authority on new forms of anesthesia and analgesia, and Dr. Asa B. Davis, equally well known as an obstetrician, who was chief of the Lying-In Hospital of New York. The use of the method has not been confined to that institution for it has been tested in the leading maternities of other large cities and the claims of its sponsors have been widely endorsed. The method is termed analgesia in place of anesthesia because the women remain conscious throughout labor and able to cooperate with the obstetrician.

The analgesic substances injected are magnesium sulphate which is administered hypodermically, and ether in an oil emulsion which is given by retention enema. However, by these resources alone the analgesia would be a failure and the failure is turned into success by the further injection of quinine hydrochloride. No extravagant claims were made for the method but it was by far the best which had been devised and reduced greatly the pain of child-

birth, while at the same time it was simple, and safe and applicable in home confinements even in the tenements. The per cent of normal labors was not unfavorably influenced by the treatment nor was the survival of the child in any way prejudiced.

The method up to 1927 had been used in over 10,000 confinements in New York in the Lying-In and other large maternities and had been tried out extensively in other large cities, notably Philadelphia and Chicago. The fact that there were hardly any authorities who were actively hostile to the method was striking when the tendency of the medical profession to look with suspicion upon newly advocated panaceas of any kind is considered.

ANALYTICAL CHEMISTRY. See CHEMISTRY.

ANCHER, MICHAEL PETER. Danish artist, died at Skagen, Denmark, September 20. He was born at Ruthsker, near Bornholm, June 9, 1840, and studied in the Copenhagen Academy. He began exhibiting in 1874, showing in that year "A Lying-In Room in Jutland." He devoted himself largely to the little fishing village of Skagen, at the extreme tip of Jutland, studying marine life and customs which found expression in numerous paintings. He was one of a group of Danish painters which centred in this fishing village, and in 1880 he married Anna Brøndum, of Skagen, who also was a painter in a similar field. His chief works include: "Tavern Scene"; "Fishermen Launching Lifeboat"; "Lay Preacher Conducting Service on Skagen Beach"; "Fisherman Returning From Seagull Hunt"; "Sunday Evening on the Beach"; "Two Young Girls"; "Boys at Meal"; "Mother's Reading Lesson"; "Will He Clear the Point?"; "Figures in a Landscape"; "Old Man Laughing"; and "Infant Class at Skagen."

ANDERSON, JOHN FRANCIS. American civil engineer and bridge builder, died at San Diego, Cal., January 24. He was born at Jernshög, Sweden, Dec. 30, 1848, and in 1869 went to America as a sailor. He began work as a laborer in the construction of the Union Pacific bridge across the Missouri River. Educating himself, he became active in bridge construction, building the river piers for the South Street bridge in Philadelphia in 1872 and constructing the foundations for the Iron Mountain Ry. bridge over the Arkansas River, at Little Rock, Ark., in the following year. In 1876 he was employed by the Government of Venezuela to supervise bridge work, and from 1876-79 he was engaged in similar work in England. He took part in subaqueous work under the Hudson River, between New York and Jersey City, in 1870-82, and in 1882-84 he was a member of the firm of Anderson & Barr which constructed many engineering works, including various bridge foundations; among them were those for the Hawkesbury Bridge, New South Wales, which were said to be the deepest foundations in the world at the time of their construction. He was active in other engineering construction works, including tunnels and lighthouses. He had interests in Cuba from 1891 until after the Spanish-American War. Mr. Anderson was the inventor and owner of patents for aerial bridges and for the pilot system of tunneling. He was a member of many technical societies, and received decorations from the Spanish and Swedish Governments.

ANDERSON, THE RT. REV. JOSEPH GUADENTUS. Auxiliary Bishop of the Roman Catholic diocese of Boston, Mass., died at Dorchester, Mass., July 2. He was born at Boston, Mass., Sept. 30, 1865, and after graduating from Boston College with the degree of A.B., in 1887 began his studies at St. John's Seminary at Brighton, Mass., graduating from that institution in 1892 and being ordained priest in the same year by Archbishop John Williams. He was a curate of St. Joseph's Church, and from 1894-1904 was chaplain of the Massachusetts State Prison. In 1903 he became director of the Bureau of Catholic Charities, serving until 1908, when he was made diocesan director of charities and pastor of the newly created St. Paul's parish, Dorchester. At this time he was made a monsignor, and was made vicar general of the Boston diocese and prothonotary apostolic, Apr. 9, 1909. On July 25, 1909, he was consecrated Auxiliary Bishop of Boston, and on June 1, 1917, became pastor of St. Peter's Church, Dorchester. Bishop Anderson founded the Roman Catholic bureau for the care of neglected and dependent Roman Catholic children, was vice president of St. Elizabeth's Hospital, and was active in various institutions.

ANDORRA, an-dor'ra. One of the smallest republics in the world, under the joint suzerainty of the French president and the Spanish bishop of Urgel; situated in the valley of the Pyrenees. Area, 191 square miles; population, 5231, scattered in six villages. The inhabitants speak Catalan and are Roman Catholics. The government is under a council of 24 members which nominates a First Syndic in whom is vested the executive power.

ANEMIA, see ANÆMIA.

ANGOLA, an-gô'la, or PORTUGUESE WEST AFRICA. A colony on the west coast of Africa, belonging to Portugal since 1575, with the exception of the years 1641 to 1648 when it was held by the Dutch. Its present boundaries were assigned by conventions of May 12, 1886, Dec. 30, 1886, May 25, 1891, and June 11, 1891, separating it from the French Congo, Southwest Africa (afterward united with the Union of South Africa), Belgian Congo, and British South Africa (now Union of South Africa), respectively. Area, 484,800 square miles; population, according to Portuguese estimates, 4,119,000, but the native population was estimated as low as 2,124,361 in 1914. Capital, São Paulo de Loanda; other important towns, Kabinda, Ambriz, Novo Redondo, Benguella, Mossamedes, and Port Alexander.

There were 52 government schools, seven municipal schools, and two private schools, with about 2410 pupils altogether. The chief products are coffee, rubber, wax, sugar, vegetable oils, coconuts, ivory, oxen, and fish. Mineral products include malachite, copper, iron, petroleum, and salt, and gold has also been found. The latest trade statistics available are those for 1925 when the imports amounted to 253,146,000 escudos and the exports were 233,638,000 escudos. The bulk of both the export and import trade was with Portugal. Angola has its own budget, the revenues for which are largely derived from taxation and customs duties, although from time to time the home government grants a subsidy. The estimated revenue and expenditures for the year 1926-27 were 135,218,863 escudos and 193,187,692 escudos,

respectively. In 1927, 818 miles of railway were open for traffic. The government is in the hands of a high commissioner vested with large powers, whose seat of government is at Loanda. The colony according to the charter of Oct. 15, 1926, is divided into 14 administrative districts, each under a governor.

ANHALT, än'hält. A German free state, formerly a duchy of the German Empire, bounded by the Prussian provinces of Brandenburg and Saxony. Area, 888 square miles; population, according to the census of 1925, 351,471. Capital, Dessau, 70,241 inhabitants in 1925. Other cities with their populations in 1925 are: Bernburg, 34,178; Cothen, 26,588; Zerbst, 19,229; Rossau, 12,300; and Coswig, 10,089. The majority of the population adheres to the Protestant religion. The estimated revenue and expenditure for the fiscal year, 1925-26 balanced at 21,225,000 marks. The public debt on Mar. 31, 1926, was 12,225,000 marks and the value of state property on Mar. 31, 1926, was 350,000,000. The government under the constitution of the free state of Anhalt dates from July 18, 1919, and by the law of Nov. 6, 1922, the administration is carried on by a ministry of state consisting of the prime minister or minister president and either one or two other ministers. As a result of the election held in November, 1924, the following parties were returned to the legislature: Socialists, 15; Middle Class Party, 14; Democrats, 4; Communists, 4; and National Socialist, 1.

ANIMAL DISEASES. See VETERINARY MEDICINE.

ANNAM, än-näm'. A protectorate belonging to France, forming a part of French Indo-China (q.v.), whose present status was established by the treaty of Feb. 23, 1886. Area, about 39,758 square miles; population in 1924, 5,171,986, including 1986 Europeans, exclusive of the military forces. Capital Hué, with a population of 60,611; largest town, Binh-Dinh, with a population of 74,400. The population is Annamite in the towns and along the coast, while Moi tribes inhabit the highlands. The products include rice, cotton, corn, and other cereals, mulberry, the arica nut, cinnamon, tobacco, sugar, betel, manioc, and bamboo. The forest products include coffee, dye, medicinal plants, caoutchou, and cardamoms. Raw silk is also produced. Probably the most important product is rice. Of the minerals, copper, zinc, coal, hematite, iron and salt are worked to some extent. Exports in 1925 totaled 40,620,041 francs; imports, 46,298,171 francs. The nominal head of the government is the king, but actual power is vested in the French Resident Superior. French troops are in occupation of a part of the citadel in the capital. King in 1927, Bao-Dai, who succeeded to the throne Nov. 6, 1925. During his minority the government is in the hands of a regency Council. A chamber of representatives of the people was established in 1926.

ANNIVERSARIES. See CELEBRATIONS.

ANTHROPOLOGY. A survey of the year 1927 shows it to be one of those interim periods marked by great activity in expeditions and inquiries but furnishing little in the way of reports of achievements. The absence of published results was most noticeable in the fields of ethnography and linguistics, while archaeology held its own. To compensate for this deficiency, however, there appeared a number of general and

theoretical works. It was significant that American publishing houses issued a number of these, a departure of recent years.

The noticeable improvement in housing conditions in Europe, long delayed by the War and post-war economics, was indicated by the movement of several museums into new quarters.

Great stimulus was given to the study of linguistic work among American Indians during the year by a subvention of \$10,000 a year for five years, from the Carnegie Corporation through the American Council of Learned Societies. With characteristic energy the programme of reaching the hitherto unrecorded stocks was undertaken by the committee in charge, F. Boas, E. Sapir, and L. Bloomfield. A few years should see adequate reports on those among the fifty-seven linguistic stocks now on the verge of extinction.

Archaeological investigations in the Southwestern United States were progressing at a rapid rate. In place of the handful of workers of two decades previously, their number in 1927 could be reckoned by the score; yet their activities on behalf of frequently rival institutions remained largely uncoordinated. Hence the great importance of the newly founded Museum and Laboratory of Anthropology at Santa Fe, which had its inception largely through the efforts of A. V. Kidder. This was to have the function of directing attention to areas needing investigation and placing workers there, as well as a clearing house for finds and information. Its success as a coordinating agency was assured by the election to the board of trustees of representatives of all the major institutions interested in this field.

THEORETICAL ETHNOLOGY. The widely divergent views raging about that most aggravated problem of *Culture: The Diffusion Controversy* (New York) was summarized by G. E. Smith, B. Malinowski, H. J. Spinden, and A. A. Goldenweiser. Spinden admirably refutes the specious argument of Smith that all significant elements of culture had their origin in Egypt and thence diffused, by showing the independence of New World development. Malinowski scores Smith's mechanical view of diffusion, holding that the heart of the problem lies in defining the adaptations that a diffused trait suffers in its wanderings. Goldenweiser equally insists that no mere juxtaposition of diffusion vs. independent invention of civilization solves the significant problems of culture development. Smith vigorously denies that traits have independently arisen more than once, that any general "psychic unity of mankind" exists. Yet R. R. Marett points out that *The Diffusion of Culture* (Cambridge) itself demands a psychic unity, if nothing more than a common imitative habit.

The method of systematic comparison of cultures in a restricted area is successfully applied to *An Analysis of Southwestern Society* in the United States by W. D. Strong (*Amer. Anth.*, 29, 1). It has long been recognized that a complex of clan-house, priesthood, and fetish jointly heritable in a maternal or paternal lineage is fundamental in Pueblo society. Strong shows that this is demonstrable among Pima and Papago to the west, and at the hand of his own novel data, is basic in Southern California. Furthermore it is usually associated with a dual organization from the Rio Grande to Central California. The similarity of the complex and

its fundamental importance throughout the area warrants the conclusion that it was anciently diffused. Subsequent movements of Yuman and Shoshonean peoples on the Colorado River interrupted the continuity of its distribution. The different reckoning of descent in the lineages, patrilineal in Southern California and Eastern Pueblos, matrilineal in West Pueblos, he interprets as originating from differences in house-owning and fetish custodianship. This is a matter of considerable theoretical importance; like Boas and Lowie he looks to a multiplicity of origins of clans (sibs) instead of the older view of the social evolutionists, a single origin.

A faith that the solution of fundamental problems of culture growth may best be approached through simple cases brings a revaluation of data on *Arrow Release Distributions* by A. L. Kroeber (*Univ. Cal. Publ. Amer. Arch. Ethn.*, 23, no. 4). The total number of ways in which the motor habits involved in arrow release can be fixed is small. They are essentially two: either the arrow alone is grasped or the string, but combinations are possible. If chance alone fixed tribal habits, the distribution of these methods would be sporadic. So far as string-pull methods are concerned this is not so; the distributions are continuous. Arrow-pull methods (used by the naive archer) are sporadic or at least peripheral. The supposition is that the habits are not hit upon at random but are the result of but a few origins with subsequent diffusion.

The wide variability in methods of *The Disposal of the Dead* suggests to the same writer (*Amer. Anth.*, 29, 308) that their fluctuations place them in a class with fashions. "Emotion evidently attaches secondarily to social behavior much as thought does." Hence "the generalization that intensity of feeling regarding any custom is likely to be a poor criterion, if any, of its permanence."

The fundamental question of how far mental traits and historical conditions contribute to cultural forms leads F. Boas to consider the *Stylistic Aspect of Primitive Literature* (*Jour. Amer. Folk-Lore*, 38, 329). Songs (poetry) and tales are universal in their distribution hence must be considered primary forms of literary activity. Repetition, frequently rhythmic, is also universal. Unlike Bücher and Wundt, who saw the origin of rhythms in work movements and dance, Boas holds that the pleasure of verbal repetition is equally fundamental. Since these traits are universal they must be laid to the common psychic habits of man. On the other hand the similarity of literary traits which are common to large areas regardless of race, but are not universal, must rest on historical factors. Such are proverbs, riddles, epic poetry, and the moralizing fable common in the Old World but unknown in the New. Similarly, motives of tales are not alike in all areas, nor the tendency to combine distinct tales, but are historically determined by the diverse cultural interests of each area.

The most fertile development in anthropology in 1927 was in the study of cultural variability. Its aim is to establish under what conditions new cultural forms make their appearance. *A Study of Folk Song Variants* in Jamaica by H. H. Roberts (*Jour. Amer. Folk-Lore*, 38, 149) shows that the thread of a song is retained in all local forms despite a well-realized wel-

come for changes in detail. Tempos, rhythmic patterns, and pitch levels are retained more closely than melodic features. Words suffer an unusually heavy attrition.

The old descriptions of cultures presented a norm of habits and actions which it was tacitly assumed was followed without variation by all the members of the particular society. The modern view recognizes individuality in primitive as well as civilized communities. Every individual participates in the culture but his life is a special variant of the norm. In other words, the norm has no more actuality than an arithmetic average. This is the position of L. Spier (*Amer. Anth.*, 29, 269); that the religion of a group, e.g., is the sum of all the individual religious formulations in the group. The individual's belief represents a special configuration of associated ideas. Spier then suggests the use of the *Association Test as a Method of Defining Religious Concepts*.

P. Radin's *Primitive Man as Philosopher* (New York) is important, not so much for what it means for the future of anthropology, but in demanding a reappraisal of those theories based on anthropological data held by philosopher, historian, sociologist, and psychologist. Radin challenges two common assumptions, namely, that primitive mentality differs in kind from civilized mentality, and that all members of a primitive group think exactly alike. Neither proposition is novel to the professional ethnologist, at least in America, but Radin's delineation of an intellectual class in such societies stresses a much neglected point. Radin maintains that the same distribution of temperaments is to be found in all societies, primitive or otherwise, hence the thinker, rationalizer, and skeptic make themselves felt in even those societies commonly viewed as containing only uniformly dull conformists.

The position of *The Father in Primitive Psychology* (New York) is generalized by B. Malinowski from his Trobriand Is. experience. "The ignorance of paternity is an original feature of primitive psychology." The Trobrianders, like the Australians, hold that intercourse is not necessary to procreation. Bearing is the act of a spirit. The father's function is solely the social one of a protector of his wife's offspring. All of the physiological facts are thus interpreted in consonance with a matrilinear society. Malinowski errs however in assuming the universality of a belief known so far to hold only for Australia and adjacent New Guinea, a continuous area but a restricted one.

Phrasing this in more general terms, Malinowski inquires how *Sex and Repression in Savage Society* (New York) differ from their forms in modern life. This leads primarily to (1) a criticism of the Freudian axiom that the Oedipus complex is the normal and universal fruit of the conflict of authority within the family, and (2) a consideration of the transitional animal-human stages in which culture began. Malinowski finds that a substitute complex is formed in the family of the matrilinear Trobrianders. There the maternal uncle exercises the authority of the father among ourselves. At the same time this authority is less directly voiced, and, being less in conflict with ties of love, produces no great conflict and no resultant ambivalence of feeling. The father's position lacks wholly the possibilities of con-

flict with the son. Malinowski's general conclusion is that the complex conforms to social regimentation.

The problem of the *Origin of the State* (New York), R. H. Lowie sees, not in seeking the specific origin of the modern organized political group, but in tracing those factors by which mechanisms of political order emerge among non-historic peoples. In short, he holds that a continuity exists from primitive to modern conditions. The primeval group, still represented by the rudest living tribes, "cohered through the unenforced acceptance of certain standards, violation of which precipitated general disapproval." Sovereignty is not a necessary criterion of statehood. The size of the state is, of course, not essential, but a consideration of the point suggests that sizable primitive states were effected by a tendency toward administrative unity following conquest. Unlike Oppenheimer, Lowie holds that conquest does not inevitably bring about caste stratification; back of that must lie a tendency to exploitation which itself is not of necessity derived from conquest. The old argument of Maine and Morgan that the territorial basis of state organization is a late development, following a condition wherein only the ties of blood held the group together, is refuted by Lowie. The local bond is present in every society; it varies in the extent to which it was strengthened so as sometimes to overshadow the blood tie. Tendencies toward autocracy or the formation of coordinated associations (such as the secret orders of West Africa) are factors which sunder the blood ties and stress the territorial. Lowie's view is that there must have been a multiplicity of origins to account for states whose nature is diverse.

LINGUISTICS. The special impetus to this branch of anthropology during the year was the establishment of a fund in the hands of the Linguistic Society of America which promised to stimulate research on all the Indian linguistic stocks hitherto untouched. A preliminary report on the distribution of dialects of the Salish stock of Northwestern America by F. Boas and H. Haeberlin (*Int. Jour. Amer. Linguistics*, 4, 117) shows the unexpected similarity of the eastern dialects of Montana and Idaho to those of the coast, with the dialects of interior Washington and British Columbia a different group lying between them. An interesting summary of what is now known of the Hittites by J. Garstang (*Nature*, June 4, 819), contains the assertion that the official language has grammatical forms resembling Indo-European. He suggests "a common even though remote parentage (Proto-Indo-European)." A group of *Washo Texts* was published by G. Dangberg (*Univ. Cal. Publ. Amer. Arch. Ethn.*, 22, no. 3).

PHYSICAL ANTHROPOLOGY. While for years palaeontologists have agreed on the common ancestry of man and the anthropoid apes, dispute has raged on the question of the exact relationship and the age in which these forms took their departure. H. F. Osborn asserted (*Science*, May 20, 481) that the apes and man became divergent much more remotely than hitherto believed, placing the split at least in Lower Oligocene or Eocene times, since which the course of their development has been increasingly divergent. He postulates a Dawn man of that date, a ground-living, erect, large-brained and speak-

ing type, wholly dissociated from the anthropoids. Further, he holds that the cleavage of the modern races of man is of remote date, extending well back into the Pleistocene. In reply (*Science*, June 24, 601), W. K. Gregory, for years his associate, shows that both anthropoids, living and fossil, and man are highly variable and plastic; that they have frequently approached each other in the course of their development; that even modern man has definite traces of a prior arboreal existence similar to that of the apes; and that the apes and man are clearly traceable to Miocene anthropoid forms. In short, that Eocene Dawn man is a fabrication not substantiated by any known direct evidence from paleontology and comparative anatomy.

Both writers hold the view that Asia is the place of man's origin. E. A. Hooton however believes that the origin was in a more westerly area, from Western Europe to Southern Africa, and that the generalized precursors were derived in Lower and Middle Miocene times (*Antiquity*, June). Mendes-Corrêa appends to an interesting consideration of the factors controlling the early dispersal of man the suggestion that the areas around the Indian Ocean may be considered with Asia as his early home (*Scientia*, October).

A critical examination of accumulating evidence on *The Dentition of Dryopithecus and the Origin of Man* (*Anthro. Pap. Amer. Mus. Nat. Hist.*, 28, pt. 1) leads W. K. Gregory and M. Hellman to conclude that this extinct anthropoid of Miocene-Pliocene times is directly ancestral to man and the living anthropoid apes. They prefer "to trace the evolution of the human dentition through that of the primitive anthropoid *Dryopithecus* back to the primitive tarsoid *Parapithecus*, rather than to invent entirely hypothetical and unknown stages leading back to unknown stem forms of pre-primates in the Paleocene or Upper Cretaceous." The chimpanzee most closely resembles *Dryopithecus* among living forms, but this fossil genus was already differentiated, such that the species of India are more closely allied to the orang, those of Europe to the chimpanzee, gorilla, and man.

The reputed find of a second *Pithecanthropus* skull in Java in 1926 was welcomed as of first importance for an understanding of this primary link between the fossil anthropoids and man. It later appeared that the find was a cast, not even of a skull, but of part of an ancient elephant or *Stegodon* (*Amer. Jour. Phys. Anth.*, x, 162). Finds completing the skull of a child of Neanderthal race at Gibraltar were announced by D. Garrod (*Science*, Mar. 11, 254). Further discoveries of L. S. Leakey in East Africa disclose an early physical type differing markedly from the existing peoples of Kenya (*Nature*, May 14, 725, July 16, 86, 90).

Since the popular fallacy still prevails that the Jews form a special race, it is of interest to observe that J. Matiegka finds those of old Prague identical with other central Europeans (*Anthropologie*, Prague, 4, 163).

Some Contributions to the Anthropology of the Buriats by G. P. Kojuroff (*J. Roy. Asiatic Soc.*, Shanghai, 58, 142) shows local differences among this central Siberian people. East of Lake Baikal, the more northerly Buriat are broader headed.

A very thorough study of *Twin Births and*

Twins from a Hereditary Point of View (Stockholm) by G. Dahlberg suggests some features of racial significance. Over and above such differences as are due to a different average age of the mothers, data for Denmark and Finland show a greater frequency of twinning than in France. But against the assumption that a higher frequency is characteristic of the Nordic race is the fact that Norway has the same frequency as France. On the other hand Dahlberg found a positive correlation with light eye color in France, Italy and Germany, especially with dizygotic twins. Within the limits of the reliability in the collection of the data, this suggests a real racial factor in the consideration of this matter.

PREHISTORY. The puzzling relations of the stone ages discovered in recent years in Eastern Asia, by 1927 stood in a fair way of being resolved. It had long been supposed that China had no stone age; its cultural history beginning in proto-historic times (i.e. bronze age). A series of stone age cultures have now come to light in China, Mongolia, and Manchuria, whose relations to the historic Chinese and to the west have been uncertain. N. C. Nelson has presented an excellent survey based partly on his own unpublished researches (*Amer. Anthro.*, 29, 177) which suggests (1) that the Palaeolithic remains of Mousterian and Aurignacian affinities are derived from those of the Yenisei in Western Siberia; (2) that a Neolithic culture of considerable antiquity, which flourished in the entire zone separating Siberia and China, is not derived from this Palaeolithic stage; (3) the Late Neolithic (Eneolithic) culture which foreshadows the historic Chinese in part is a local development of this with only slight traces of Western influence. "While our recent investigations to date have furnished no evidence either for or against the biological origin of man in Asia, the evidence brought to light respecting the beginnings of culture point elsewhere."

Further light on the prehistoric cultures of the Altai mountains, Siberia, result from the expedition of the State Russian Museum under S. J. Rudenko in 1924-5. Late stone and bronze age implements were discovered. Stone age ornaments suggest a connection with Byzantine culture (*Nature*, Mar. 5, 367).

Egypt has long been recognized as a focal point of cultural development from the earliest proto-historic times. At the same time the almost complete absence of Neolithic remains, due largely to being covered by the silt which filled in the Nile valley, has made it difficult to understand the relations of pre-dynastic Egypt to the local palaeolithic cultures. Contrary to the view of W. Flinders Petrie that the Fayum and Badarian cultures of Neolithic aspect are offshoots of a Solutrean people who about 15,000 B.C. moved from the Caucasus to the Nile region, E. W. Gardner and G. Caton-Thompson have shown (*J. Royal Anth. Inst.*, 56, 301) that both are definitely Neolithic. Fayum is the earlier, and both are free from dynastic Egyptian influences. Miss Caton-Thompson was to resume efforts to date the North Fayum culture during the winter of 1927-8 (*Nature*, Oct. 29, 629).

The discovery of flints of uncertain age from the desert between Mesopotamia and Palestine was announced by L. H. Dudley Burton and H. Field (*Nature*, Apr. 30, 651). These are at

least pre-Sumerian and possibly of late Palaeolithic age.

The first Palaeolithic remains from Scotland were reported from a cave in Sutherland, these being of upper Palaeolithic type. Others, somewhat doubtful, from Sligo, Ireland, may represent the first Palaeolithic finds there as well. But the case was rejected in toto by Macalister, Charlesworth, Præger, Stelfox, and Warren (*Nature*, Mar. 26, 475; Aug. 20, 260; Nov. 5, 652).

Transitional development of culture from Mousterian to Aurignacian was demonstrated in a series of strata in a rock shelter at Rochettes, Dordogne, by Courtier and Emetaz (*Bull. Soc. Anth. Paris*, 7, fasc. 4-6). Another cavern with evidence bearing on transitions was announced by Saint Périer (*L'Anthropologie*, 37, 3-4). Three strata contain neolithic, transitional Magdalenian-Azilian, and early Magdalenian remains. These finds suggest that the old idea of abrupt breaks between these cultures will be replaced by the view that they developed one from another largely on the spot.

A new Tardenoisian site (transitional Palaeo-Neolithic) was discovered at Cape Blanc-Nez, France. A Magdalenian level had been found beneath one of early Neolithic age in a grotto at Serrières-sur-Ain. A skull uncovered in this level has australoid or negroid characters which suggest descent from the Grimaldi race (*Nature*, July 30, 163, Aug. 13, 239).

The reputed discovery at Glozel, near Vichy, France, of neolithic objects with inscriptions on clay tablets which suggest a western origin for writing (see YEAR BOOK for 1926, p. 43) was found fictitious by Crawford, Breuil and de Pradenne. An international commission appointed by the Institut d'Anthropologie at its Amsterdam meeting proceeded to the spot for further investigations. (*Nature*, July 2, 20; Sept. 3, 342; Oct. 15, 559; Nov. 12, 703). The controversy was active at the end of the year.

Stratified sites in South Africa are almost unheard of. Especial importance therefore attached to those discovered by V. Lebzelter (*Anthropos*, Vienna, 21, 952; 22, 244, 571). The evidence suggests a series of stone cultures ranging back from Bushman types to others resembling European Palaeolithic. Climatic oscillation is evidenced, with the cultures flourishing in the intervals of steppe conditions. These forms have been found over a wide area from Southern Transvaal to Southeastern Good Hope.

Equally important is the evidence from Nakuru, Kenya, Eastern Africa, of deposits antedating two pluvial periods. Not only does the stone culture resemble the Azilian of Europe, but the human remains are of a type quite distinct from modern negroes (*Nature*, 119, 61; 120, 338).

From the standpoint of culture history, interest attaches to the discovery that the Sumerians were in possession of an advanced type of wheat at an early date. The grains, found near Kish, Mesopotamia, are identified as *Triticum turgidum* and dating from 3500 B.C. On the other hand claims are made for a knowledge of barley alone in early Egypt, wheat dating only from dynastic times, but this does not seem acceptable (*Nature*, 119, 81; 157, 280). A résumé of *The Beginnings and Early Spread of Agriculture* by H. J. E. Peake (*Nature*, June 18, 894) makes it appear that wheat and per-

haps barley were first cultivated in Syria, probably on the slopes of Mount Hermon. Wheat arrived in Egypt in middle pre-dynastic times, where barley may have been grown earlier.

OLD WORLD ETHNOGRAPHY. The descriptive ethnography of the Old World was only scantily represented in publications of the year. This was probably the result of the infrequent expeditions of European institutions of the war years and those following. To his earlier study R. S. Rattray added an account of *Religion and Art in Ashanti* (London). A host of supernatural beings are conceived whose interest must be maintained by sacrifice, in order that the fertility of the land and of mankind may persist. The king is only secondarily divine; the divinity residing rather in his throne. An unusual feature is a treasury of gold, guarded by an armed group, which belongs to the dead kings but from which the reigning monarch may borrow.

The anomaly of Madagascar, with its Malay language and customs quite across the Indian Ocean from Malaysia is explained by H. M. Dubois by an elaborate scheme of migrations (*Anthropos*, Vienna, 22, 80). The earliest immigrants in remote antiquity were negritos, later dispossessed by negroes, both coming from some Asiatic centre. Still later they were forced into the interior in turn by a mixed negroid group containing Malay elements. Further influxes of Arabs, Semites, and Indians followed. Only in the last four centuries did the resident Malay make their influence strongly felt. Coincident with this suggested history R. Linton lets drop the tantalizing hint that the Malay were the first to occupy the island (*Amer. Anthropologist*, 29, no. 3).

In view of the rôle which their cultures play as an archaic stratum in the historical scheme of the Schmidt-Koppers *Kulturkreis* school, the interest of the *Anthropos* group in the Bushmen and Pygmy cultures is intelligible. In addition to the archaeological investigations of Bushman territory by V. Lebzelter mentioned above, they have also fostered P. P. Schumacher's expedition to the Central African Batwa pygmies (*Anthropos*, 22, 530). The importance of this account of social life, brief though it is, lies in that practically nothing is known of the non-material aspects of their culture. A newly discovered pygmy group in New Guinea is briefly reported on by F. Kirschbaum (*Anthropos*, 22, 202). The negritos of Malacca are the subject of a sketch by P. Schebesta (*Bei den Urväldewergen von Malaya*, Leipzig).

A. Maass issued a study of star lore in the Malay archipelago (*Tijdsch. v. Indische Taal- en-Volkenkunde*, Batavia).

The now general use of distribution studies as the first step toward historical analysis is exemplified by K. G. Lindblom in *Die Schleuder in Afrika* (*Riksmuseets Ethn. Aodeln., smärre medd.*, 2, Stockholm). Slings were known in the classic world and to the Hebrews, Assyrians, Persians, and Egyptians. They are found from Arabia southward to Madagascar and again in a distinct area in Western Africa. The earliest known slings are Egyptian, whence they spread to adjacent Asia and Southern Europe in historic times. Similarly, late Hamitic influences carried them into Western and Eastern Africa. The distribution of *Musical Instruments in Celebes* has been worked out by W. Kaudern

(*Ethnog. Studies in Celebes*, Goteborg III). Only a few are native; the more complex types are present because of Hindu, Chinese, or Mohammedan influences.

The culture of Niue is viewed as of archaic Polynesian type by E. M. Loeb (*Bull. Bishop Mus.*, 32). This inference is derived from the lack of complex political organization, priestly class, occupational differentiation, and genealogies; all features present in developed Polynesian communities.

Concerned with the origins of Polynesian culture, E. S. C. Handy commenced a study "of the remnant of Polynesian cultures of China, Siam, and India." Of the Tanka and Hakka, living near Canton, he says: "They are certainly wholly Chinese now in culture. That is quite as it should be, for the distinctive elements belonging to the Tangeloa Polynesia are distinctly Chinese. The problem will prune deep into Chinese history and culture." (*Rep. Director Bishop Mus. for 1926*, 6).

NEW WORLD ETHNOGRAPHY. As in the Old World, ethnographic accounts from this province were less numerous than those dealing with archaeological remains. It is customary to treat the latter coincidentally with observations on living peoples, since nothing has yet been found in America which can lay claim to great antiquity.

The most recent suggestions of man in America in Pleistocene times, which is to be expected on inferential grounds, were the claims of Figgins and Cook that artifacts have been found with extinct bison at Raton, N. M., and Colorado, Texas. A less certain case was reported from Frederick, Oklahoma.

To the scanty data on stratification may also be added the suggestion of G. Langford that in *The Fisher Mound Group* of Illinois, brachycephals were preceded by a long-headed group (*Amer. Anth.*, 29, 105, no. 3).

A notable increase in the number of archaeologists at work in the Pueblo area of Southwestern United States was observable at the field conference held at Pecos, N. M., in August under the leadership of A. V. Kidder. Essential agreement was reached on the course of development from a nomadic, long-headed, non-agricultural population to the existing broad-headed, agricultural Pueblos. While the basic element, agriculture, was diffused from the south, as well as later elements, such as cotton growing, loom weaving, and probably pottery, it was held that the development was essentially autochthonous. Eight stages, fixed by stratigraphic evidence, were defined: Basket Maker I-III, Proto-Pueblo, Pueblo I-IV. The need for examination of the peripheral areas was stressed. (For details see *Science*, Nov. 18, 1929.)

The first of these cultures, Basket Maker, as the name indicates, is devoid of the potter's art. It makes its first appearance at the Post-Basket Maker (Basket Maker III) level. It has long been a moot point whether this is an indigenous development or derived from the ancient civilizations of Mexico as the majority believe. E. H. Morris inclines to the former view, that *The Beginnings of Pottery Making in the San Juan Area* (*Anth. Papers Amer. Mus. Nat. Hist.*, 28, pt. 2) are local, since the earliest wares were moulded in baskets and unfired. The following stage is true built-up pot-

tery, fired and with painted decoration in imitation of contemporary basket designs.

A quota of special inquiries have been made in the area. *Archaeological Observations North of the Rio Colorado* by N. M. Judd reveals a marginal and perhaps early Pueblo culture (*Bull. Bur. Amer. Ethn.*, 82). *Archaeological Explorations on the Middle Chinlee* in Arizona by N. Morss (*Mem. Amer. Anth. Assn.*, 34) shows it to have been occupied through the whole period of known history of the Southwest prior to the Spanish advent. *A Stratigraphic Study in the Gila-Salt Region, Arizona* by E. F. Schmidt (*Proc. Nat. Acad. Sci.*, 13, 291) marks the first intensive study in that area, although work was begun there more than thirty years ago.

The Social and Ceremonial Organization of Cochiti in New Mexico is essentially that of other Pueblos (*Mem. Amer. Anth. Assn.*, 33). E. S. Goldfrank suggests that formerly the matrilineal clans may have had more important functions now dwindling in the presence of patrilineal ceremonial moieties. As E. C. Parsons has pointed out, the former are typical of the western Pueblos, the latter of the eastern; Cochiti being geographically intermediate. There is the familiar Pueblo separation of secular and ceremonial officials; in this case the ceremonial organization is the more rigid. A peculiar linkage joins each dance society with one of the curing fraternities.

A survey of *The Northern and Southern Affiliations of Antillean Culture* (*Mem. Amer. Anth. Assn.*, 35) by C. D. Gower shows that most, if not all, of the island culture was derived from South America. The local culture reached a higher plane of elaboration than the parent group, however. Strangely enough, there is little indication of influence from Central America. Resemblances with Southern United States suggest development from a common ancient culture with subsequent slight additions over a long period of time.

A step toward closing the gap in descriptive data which exists between California and British Columbia was the publication of E. Gunther's *Klallam Ethnography* (*Univ. Wash. Publ. Anth.*, 1, no. 5). This sketch of a coastal Washington tribe was especially full on social and ceremonial life. The characteristic caste system of the coast to the north is in effect here and a single secret society in imitation of the many among northern tribes appears. In the same area R. L. Olson's study of the *Adze, Canoe, and House Types of the Northwest Coast* (same series, 2, 1) shows that while these were not invented within the area, certain specializations have appeared which spread from local points of origin. A further study from this intermediate culture zone is an analysis of a historic case of diffusion (*The Ghost Dance of 1870 Among the Klamath of Oregon*, same series, 2, no. 2). Following Kroeber, L. Spier traces it from an origin in Nevada, with subsequent diffusion back and forth across California. It seems that the cult has been diffused as a whole, ritual and ideology alike.

Further *Contributions to Fow Ethnology*, comprising ceremonial data, have been issued by T. Michelson (*Bull. Bur. Amer. Ethnol.*, 85).

Eastern Greenland, now unoccupied, once contained an Eskimo population, whose origin and fate are mysterious. J. M. Wordie reported (*Na-*

ture, Apr. 2, 506) that the population was scanty and probably did not arrive, at least to any degree, via a northern route as prevailing inference holds.

Pottery Types and their Sequence in El Salvador, as defined by S. K. Lothrop (*Indian Notes and Monographs*, I, no. 4), is based on the only stratified site between Mexico and Ecuador. Volcanic activity in Central Salvador subsequent to an early occupation of the country deposited a deep layer of ash in the upper layers of which are a complex of types. The remains of the lower level are identifiable with the Archaic horizon found in the earliest deposits in the Valley of Mexico. The novelty of the upper culture is the inclusion of Archaic forms (of somewhat different type) with recent types, among them those of the Old Mayan Empire. This indicates a persistence of both types, which in the latter case are posterior to the Old Empire towns, such as Copan.

The cultures of *Coast and Highland in Prehistoric Peru* are unequally represented in present-day conceptions of their pre-Columbian development, according to A. L. Kroeber (*Amer. Anth.*, 29, 625). The majority of opinions, following Uhle, are based almost wholly on evidence of the coastal cultures. Tello is of the opinion, however, that highland culture is basic, the coastal forms representing largely local elaborations of it. The difficulty in resolving these views is that the highlands are but little known.

Further unravelling of the complex culture history of Peru by A. L. Kroeber reveals the place of the *Ancient Pottery from Trujillo* (*Mem. Field Mus. Nat. Hist.*, 2, 1) on the northern coast. In the general eras of Peru (pre-Tiahuanaco, Tiahuanaco, pre-Inca, and Inca) the Trujillo wares are chiefly pre-Tiahuanaco, and later pre-Inca and Inca. In the earlier period, relations were chiefly to the northern interior; in the later, elements from a wide area were incorporated in the local style.

Still further stylistic analysis of ancient Peruvian pottery by A. H. Gayton and A. L. Kroeber (*Univ. Calif. Publ. Amer. Arch. Ethn.*, 21, 8, 24, 1) show that typical Nazca ware is in two styles. The earlier merges into a second, followed by wares distinctive of the neighboring valley of Ica. The change in design shows in part a gradual shift of interest from representation to execution. At Nieveria a late Nazca style is followed by local Proto-Lima types involving several stylistic strains. The method of analysis is noteworthy. The several substyles were first separated on the basis of form, then independently by design and color. It was found that the coincidence of form group and design-color group was greatest on wares attributed to the assumed substyle.

The year 1927 saw the appearance of two general works on South and Middle America, which fortunately are complementary. R. Katten's *The Civilizations of South America* (New York) is almost wholly concerned with religion and social organization, while *Handbuch der Präkolumbischen Kulturen in Latein Amerika* (Hamburg) of T. W. Danzel is a brief but rounded series of sketches based on early documents and archaeology.

NEWS, EXPEDITIONS, PERSONALIA. Special studies in South America were continued by the Göteborgs Museum (Sweden). E. Norden-

skiöld and S. Linné made archaeological studies on the Pearl Islands and the Bay of Uraba, Panama, and on the coast of Colombia, and visited the Chocó, Cunas, and Bogotá tribes. C. Nimuendajú continued work on the Rio Negro, Brazil. The museum also acquired an important collection from Guiana made by W. Roth. The Naturiska Riksmuseet, Stockholm, had sent H. Granvik to the Turkana and Bagishu, Eastern Africa, and C. C. Luck to excavate at Lumbwa, Kenya, in the same territory. J. G. Anderson was sent to Chili and Shansi, China. New collections at this museum include material from the Kenya, Dutch Borneo, from the Touaregs and others of Northern Africa and from Kavirondo and Nandi, Kenya. A Danish expedition, lead by C. Olufsen, explored the upper Niger, Volta, and Southern Sahara in Western Africa.

The Royal Anthropological Institute (London) formed a committee to organize research, which issued an appeal for funds. They had dispatched Miss G. Caton-Thompson to the Fayum to date her earlier finds. Cambridge had G. Bateson in New Guinea. T. C. Hodson succeeded A. C. Haddon as reader in ethnology at this university, where stress was to be laid on courses for colonial administrators. The first permanent full-time chair in the British Isles was given B. Malinowski at the University of London. E. Pritchard visited tribes of the Southern Sudan for this institution, principally the Niam-Niam.

The Rijks Ethnographische Museum, Leyden, was moving into new quarters. Its new collections contain material from Java, Surigao, the Batak-lands, Tenimber, Greenland, and some Oriental objects. C. C. Uhlenbeck continued his work in general and American linguistics. Of special interest will be his opinion of Wiyot (California) as an Algonkian language. The Koninklijk Nederlandsch Aardrijkskundig Genootschap, in new quarters in Amsterdam, had an expedition to the Wilhelmina mountains, Surinam. A new museum was planned for the ethnological section of the Naturhistorisches Museum in Vienna, the Asiatic collection being ready at the end of the year.

The Museum für Völkerkunde in Leipzig was in a new building, with H. Damm added to its staff for Oceania-Indonesia. The reopening was planned for the autumn of 1929. Collections from the Veddas, Eskimos, from Dalmatia, the Congo and South Kamerun, were added. The Forschungsinstitut für Völkerkunde in the same city continued its expedition among the primitive people of India. The Rautenstrauch-Joest Museum of Cologne, which was directed by J. Lips, reorganized its east Asiatic, South American, and African collections.

The Museo Nazionale di Antropologia e Etnologia, newly housed in Florence, added collections from Italian Somaliland made by Stefanina-Puccioni and those of L. Cipriani from South Africa, in particular from Zululand. The Società Italiana di Antropologia e Etnologia had joined forces with this museum. The newly founded Museo Missionario-Etnologico at the Lateran, Rome, opened December 27 under the directorship of W. Schmidt. This was a continuation of the Vatican Missionary Exposition of 1925. The intention was to develop a school for missionaries and collections for research use.

Activities of American institutions were nu-

merous. For the National Museum of Canada (Ottawa), W. J. Wintemberg excavated Algonkian sites north of the St. Lawrence. C. M. Barbeau continued his study of the social organization of the Nass (British Columbia), and in the same region H. I. Smith excavated on the Skeena River. D. Jenness visited Newfoundland for Beothuk remains, and J. C. B. Grant made an anthropometric survey of Cree and Ojibway. The Provincial Museum (Victoria, B. C.) acquired the Tolmie collection of Northwest Coast objects.

The American Museum of Natural History (New York) had H. L. Shapiro excavating post-Basket Maker sites in Northwestern New Mexico. N. C. Nelson returned with remains of Neolithic, Azilian, and Mousterian cultures from Mongolia and the Yantze gorges. G. C. Vaillant joined the staff to take charge of Middle American research. The Bureau of American Ethnology (Washington) had J. W. Fewkes examining mounds in South Carolina, J. R. Swanton concluding his Creek studies, F. LaFlesche compiling an Omaha dictionary, F. Densmore obtaining Winnabago songs, and F. H. H. Roberts investigating caves near El Paso, Texas, and excavating in Chaco canyon, N. M., and in Southeastern Utah. J. N. B. Hewitt continued Iroquoian studies, T. Michelson those among the Fox and Arapaho, and J. P. Harrington was with the Mission Indians, California. For the United States National Museum (Washington) A. Hrdlička made a reconnaissance of village sites in Alaska, and H. B. Collins with T. D. Stewart studied the little modified Eskimo of Nunivak Island, Alaska. Archaeological work by W. Hough in Tennessee and in the Southwest, and by H. W. Krieger on the Columbia and Snake Rivers was carried on. M. W. Stirling returned with collections from South Central New Guinea. A. V. Kidder joined the staff of the Carnegie Institution of Washington, July 1, to assume charge of activities in this field. S. G. Morley and E. H. Morris excavated at Chichen Itzá, Yucatan, and O. G. Ricketson at Uaxactun, Guatemala.

The Field Museum of Natural History (Chicago) maintained five field expeditions. W. D. Strong left for Labrador to investigate Naskapi and Eskimo, while J. Borden returned with an Alaskan Eskimo collection. In cooperation with Oxford University work was resumed at Kish, Mesopotamia, on the excavation of the Sumerian temple of the Earth Goddess of Harsagkalama. H. Field gathered material on prehistoric man in Europe and Arabia. R. Linton's expedition to Madagascar returned at the end of the year. New additions to the museum's staff were W. M. McGovern for South American ethnology, J. E. Thompson for Mexican and South American archaeology, and T. G. Allen for Egyptian archaeology. Structural changes made eleven new halls available for anthropology. The new museum of the University of Michigan was nearing completion. For this institution, work was continued in Michigan, and C. E. Guthe and W. V. Kintz visited Southern Kentucky. The museum of the University of Pennsylvania acquired an extensive series of Alaskan objects collected by L. Shotridge. For the Southwest Society, E. C. Parsons continued studies of the Pueblos and visited the Kiowa.

American universities continued active support of anthropological research. Of the Colum-

bia University group, F. Boas studied the Chehalis language, M. Jacobs the Klicitat, G. A. Reichard the Coeur d'Alene, all languages of Washington and Idaho. R. L. Bunzel continued work at Zúñi, N. M., and R. F. Benedict among the Pimas (Arizona). G. Herzog studied the music of the Pueblos and their neighbors. M. J. Herskovits continued his investigations of negroes, in conjunction with which O. Kleinberg made psychological studies. For the Institute of Psychology, Yale University, P. Radin prepared his Winnebago notes, H. Roberts completed a study showing the effects of emotional status on Indian music, B. Blackwood continued measurements of Southwestern Indians and mental tests of school Indians. E. M. Pilpel developed a psychological analysis of mythologies and S. de Aberle surveyed family life of primitives. The University of California continued A. H. Gayton's researches among the Yokuts and sent R. L. Olson to Santa Cruz Island, Cal., for excavations.

The Peabody Museum (q.v.), Harvard Univ., had A. M. Tozzer and H. J. Spinden continue research on Middle America and S. J. Guernsey on Northeastern Arizona. C. B. Cosgrove completed excavations in New Mexico. C. Peabody carried on archaeological investigations in France and W. B. Cline in the Nile Valley. C. S. Coon studied the Moroccan Berbers and G. D. Williams the Maya of Yucatan. Valuable collections were secured from Southern Dutch New Guinea and others from the Andamanese (India), Teguala of Panama, and Amueshu of Peru. The University of Chicago's archaeological survey of Illinois was completed for the northern counties, in which excavations revealed three native cultures. E. Sapir studied Athapaskan tongues in California and the Grebo language of Liberia.

The University of Oklahoma inaugurated work in this field with the appointment of L. Spier. M. Herskovits joined the staff of Northwestern University and T. T. Waterman that of the University of Arizona.

The Museu Nacional of Brazil (Rio de Janeiro), under the direction of Roquette-Pinto since October 11, was carrying on investigations of the school children of Rio, of Brazilian monkeys, the caves of Lagoa Santa, and the Sambaquis of Southern Brazil. J. C. Tello of the Museo de Arqueología Peruana (Lima) excavated material in coastal Peru (Department of Ica) for the government exhibit in Seville, Spain.

The formation of a committee of the Australian National Research Council in 1927, headed by A. R. Radcliffe-Brown, gave great impetus to research in that continent. Nineteen grants were made. T. D. Campbell and J. B. Cleland visited Macumba Station and Alice Springs in January for anthropological and physiological data. Early in the year, Professors Chapman and Priestly made studies of the basal metabolism of the natives at Wallaga Lake, New South Wales. Dr. H. K. Lee visited Palm Island for data on physical anthropology. V. McConnell studied the tribes of Archer River, Gulf of Carpentaria, W. L. Warner those of the Northern Territories, and A. P. Elkin the tribes of the Kimberly district, Western Australia. H. Hogbin visited the outlying islands of the Solomon group, while R. F. Fortune made ethnological and psychological observations in New Guinea.

The Bishop Museum (Honolulu) staff was augmented by the appointment of P. H. Buck. H. Hamilton left that of the Dominion Museum (Wellington, N. Z.).

The triennial congress of the International Institute of Anthropology met in Amsterdam, Sept. 19-24, at which the Prix Hollandais was awarded D. Garrod for her work in prehistory at Gibraltar. The International Institute of African Language and Culture met at Paris, Dec. 13, 1926. The government of the Gold Coast promised £500 a year for two years. The government of British Honduras has asked the British Museum to supervise archaeological explorations of that country. The Kaiser Wilhelm Institute for Anthropology was inaugurated in Berlin-Dahlem, September 15, with E. Fischer as director.

The Loubat prize for Scandinavia was awarded W. Thalbitzer, March 20, for his studies in Americana. An honorary doctorate was conferred by St. Andrews University, on K. Rasmussen, the Greenland explorer. The Royal Anthropological Institute (London) awarded the Huxley Memorial to A. Hrdlička on November 8, and the Rivers Memorial medal for field work to B. Spencer. The University of Leeds conferred the doctorate of laws on A. Keith.

NECROLOGY. Several founders of modern anthropology died in the year. Leon P. Manouvrier (q.v.) was professor of the Paris Ecole d'Anthropologie and a well-known physical anthropologist. Maurice Delafosse (b. 1870, d. November 13) was a distinguished scholar of West African languages and culture, Governor of Oubangi-Chari in 1918, professor at the École Coloniale and Ecole des Langues Orientales Vivantes. Gustav Fritsch, aged 89, was professor of anatomy at the University of Berlin, and a contributor to physical anthropology. England lost Edwin S. Hartland (b. 1848, d. June 19) whose interests lay in folklore, society, and religion; Sir H. H. Johnston (q.v.), one of the pioneers of East African ethnography; and Sir William Ridgeway of the University of Cambridge. George B. Gordon (q.v.), director of the University of Pennsylvania Museum, also died.

ANTIGUA. See LEWARD ISLANDS.

ANTIOCH COLLEGE. A non-sectarian, co-educational college at Yellow Springs, Ohio; founded by Horace Mann in 1853. The number of students enrolled for the autumn term of 1927 was 720, of whom 186 were women and 534 men. The faculty had 62 members. The productive funds of the institution amounted to \$142,822.73, and the income for the year was \$303,409.73. The library contained approximately 24,000 volumes. Antioch College was being conducted on the belief that academic training alone does not fit a young person for life, and was so organized that the students divided their time between school and practical work as part of the economic community. President, Arthur E. Morgan, D.Sc.

ANTI-SALOON LEAGUE OF AMERICA. A federation of churches and temperance organizations in the United States, united against the beverage liquor traffic. It was established in 1895 by a coalition of the Anti-Saloon Leagues of four States and the District of Columbia. At the end of 1927 it embraced 29 State or Territorial Leagues and had affiliations with 40 other national temperance organizations, as well as with the World League Against Alcoholism

(q.v.). During the year the work of the League was carried on by over 1500 representatives. This work included a widespread educational campaign on the evils of the use of alcohol and the duty of observance of the law, carried on through the press, pamphlets, the pulpit, and the lecture platform. The legislative work of the year included supporting the Reorganization bill, providing a bureau of prohibition and a bureau of customs in the Treasury Department; the bill was passed by the Senate after the cloture rule was invoked in the closing days of the Sixty-ninth Congress.

The League cited as outstanding events of the year the decisions of the Supreme Court upholding and construing the anti-smuggling liquor treaty with Great Britain and the action of the Court in refusing to review an injunction against a cabaret keeper who knowingly supplied facilities for illegal drinking. The League issued statistics based on official reports, demonstrating that the consumption of intoxicants had dropped to a small fraction of its former total. *The American Issue*, published at Westerville, Ohio, is the official organ of the League, both a national edition and many State editions being published. Its monthly circulation was about one million copies. The National Headquarters are at Washington, D. C. The officers for the year were: President, Bishop Thomas Nicholson, Detroit, Mich.; secretary, S. E. Nicholson, 370 Seventh Avenue, New York, N. Y.; treasurer, Foster Copeland, Columbus, Ohio; general superintendent, F. Scott McBride, Washington, D. C.; general manager of publishing interests and of the Department of Education, Ernest H. Cherrington, Washington, D. C. See PROHIBITION.

ANTI-SEMITISM. See AUSTRIA under *History*; JEWS.

ANTI-TOXIN. See DIPHTHERIA.

ANTRANIK, GENERAL. See CUZANIAN, ANTRANIK.

APES, ANTHROPOID. See ANTHROPOLOGY, under *Physical Anthropology*.

APPENDICITIS. In a paper on this subject by Bower and Clark of the Samaritan Hospital, Philadelphia, with the subtitle "Some Fallacies of Present Day Teaching" (*Journal of the American Medical Association*, Sept. 10, 1927) the authors asserted that the operating surgeon had the least to do of any concerned with the factors which govern the reduction of mortality; meaning of course that the patient, his friends and the family physician, who bear the least of the responsibility, have the most to do with such factors. It was well understood by all intelligent and informed persons that the earlier the diagnosis is made and operation performed, the better the outlook for recovery; and this axiom was verified daily by the statistics of hospitals. The authors adduced a comparatively new factor in prognosis, the danger in giving laxatives—new in the sense that heretofore this had not been reduced to a statistical basis. In the Samaritan Hospital during 1926 over 92 per cent of all patients who died from spreading peritonitis following rupture of the appendix had taken laxatives before admission. As a result 600 letters were sent out to physicians who referred their patients to the hospital, each containing numerous stickers and cards, with a warning to give no medicines by the mouth to

patients with abdominal pain, but to call in the family physician at once and in the meantime apply an ice bag or hot water bottle and empty the bowels with an enema. The physicians receiving these warnings were requested to affix the stickers to their monthly statements and distribute the cards to other patients.

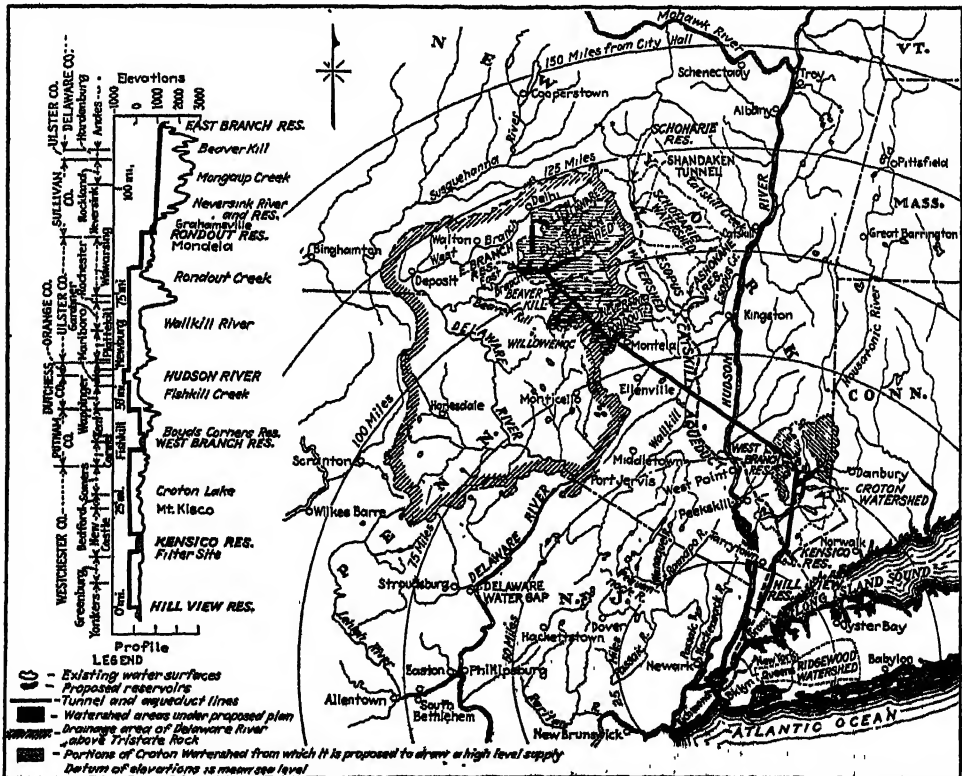

Statistics continued to show that there should be almost no mortality following appendicitis operation unless in the event of spreading peritonitis or abscess. Dr. Riedel of the Deaconesses' Hospital, Stettin (*Münchener medizinische Wochenschrift*, Aug. 26, 1927) quoted a mortality of but 1.77 per cent in a thousand cases operated on in 1925-26. Of this number there were 131 with the complication of peritonitis or abscess, and in this series the percentage of deaths was about 12, which accounted for the great majority of the total deaths. The statistics of the American authors quoted above appeared to fix some of the responsibility for spreading peritonitis on the custom of taking laxatives—notably castor oil—for abdominal pain.

APPLES. See **HORTICULTURE.**

AQUEDUCTS. Throughout the year progress continued on the developing and extension of water supplies for large cities and metropolitan areas. The notable feature of many of these projects was the scale on which they were planned, as it was realized that future needs must be taken into consideration. In many projects there were long lengths of conduits involving not only tunnels, but steel or concrete pipe. Some of the more notable aqueducts are discussed below.

NEW YORK CITY WATER SUPPLY. The New York City Board of Water Supply during the year recommended to the Board of Estimate of the city, a project for an additional water supply of 700,000,000 gallons per day of which 600,000,000 would be from flood flows of tributaries of the Delaware River in New York State and 100,000,000 gallons per day from Rondout Creek, a tributary of the Hudson River. The Board proposed construction in three stages, estimated cost of the first two of which, affording a supply of from 510,000,000 to 540,000,000 gallons per day, being \$272,587,000, or \$75,347,000 less than the estimated cost of providing 434,000,000 gallons per day from streams east of the Hudson River, as recommended by the Board in October, 1926, and referred to in the 1926 YEAR BOOK.

The new plan provided for turning the yield of the higher portions of the Croton drainage area into the existing Catskill terminal reservoir. It involved the construction of five storage reservoirs in the upper tributaries of the Delaware River and a sixth reservoir on Rondout Creek. There would be required a tunnel or aqueduct extending from the East Branch Reservoir to Rondout; a tunnel from Neversink to Rondout; and a tunnel from Rondout Reservoir to West Branch Reservoir; as well as one from the West Branch Reservoir to Kensico Reservoir. Furthermore, a new aqueduct from Kensico Reservoir to Hillview Reservoir would also be required. The total cost of the project involving the various dams, reservoirs, and aqueducts was estimated at \$272,587,000. The accompanying plan and profile indicate the main features of the project.

From *Engineering News-Record*

PROPOSED EXTENSION OF NEW YORK'S WATER SUPPLY

The New York City Board of Estimate not only had this project under consideration, but it approved plans for the new pressure tunnel 17 feet in diameter and 20 miles in length at the upper end of the system to supplement the tunnel already in use to deliver water from the Catskill aqueduct system to the various parts of New York City. Studies for this tunnel were under way, but no contracts had been let up to the end of the year. The Board of Estimate also had under consideration a plan to develop a supply of 150,000,000 gallons per day from wells on Long Island for emergency use.

SAN FRANCISCO. During 1927 active progress was made on the Hetch Hetchy Project to bring to the city of San Francisco water from the head waters of the Tuolumne River, a distance of 168 miles. As noted in previous YEAR BOOKS the storage reservoir and 18 miles of the tunnel in the mountain division had been completed; while power had been generated in the Moccasin Creek plant yielding a substantial revenue. The element of the project under construction in 1927 was a 13 x 14 foot tunnel in the foothills division, 16 miles in length, of which on December 15, all but two and one-half miles had been driven. This tunnel for about 37 per cent of its length was to be lined with concrete. In addition to the foothills tunnel there remained to be built 45 miles of steel pipe across the San Joaquin Valley and 30¼ miles of tunnel to the Coast Range Mountains. It was estimated four years more would be needed for this work.

MOKELUMNE WATER SUPPLY. This project for supplying the cities of the east side of San Francisco Bay with water derived from the storage reservoir on the Mokelumne River through a 95-mile aqueduct made continual progress during the year. In fact, early in December it was stated that 82 per cent of the aqueduct was already in place and the completion would be looked for some time in 1928. As stated in the 1926 YEAR BOOK, this aqueduct consists of steel pipe 65 inches in diameter, operating under a head of about 500 feet in the lower level. In July work was begun on the outlet tunnel from Pardee Reservoir 2.2 miles in length and by December 15 the headings had advanced some 1900 feet so that the tunnel could be completed by the middle of 1929. Work was also in progress on the Claremont section, 3.4 miles in length which was to be completed in 1929. In addition to the water supply project a bond issue of \$26,000,000 for the purchase or construction of a distributing system was authorized by the voters of the district so that the water could be delivered direct to the ultimate consumers.

COLORADO RIVER AQUEDUCT. The city of Los Angeles, Cal., for some years had realized that it would be necessary to make plans for increasing its water supply and was looking to the Colorado River, a distance of 260 miles, as a source of an adequate supply. Preliminary field studies had been under way for four years and during 1927 these investigations were completed covering 18,000 square miles of desert country through which the proposed aqueduct would pass. At the end of the year engineers were working on cost estimates so that a complete report with detailed recommendations could be submitted by the chief engineer of the city's department of water and power to the city board of water and power commissioners.

LOS ANGELES AQUEDUCT. During the year the Los Angeles Aqueduct was dynamited several times in the warfare that was in progress between the residents of Owens Valley and the city of Los Angeles, on account of damages alleged to have been suffered by diversion of water. The aqueduct was first dynamited in two places on May 27 and 28, and the repairs were speedily completed, large storage reservoirs at the Los Angeles end of the aqueduct preventing danger of any interruption in the city's water supply due to a shutdown. One of these blasts was in No-Name Canyon siphon, 170 miles north of Los Angeles at the east end of the Owens Valley.

This blast destroyed a length of pipe totaling 476 feet, the damage being increased by the fact that there was a flow of water which washed out the line, while additional damage was done by collapse, due to vacuum established. On May 28, a blast tore away two 30-foot sections of flanged welded steel in the penstock at Big Pine, supplying the big power house in Owens Valley, 16 miles west of Bishop, but these sections were replaced after an interruption of about four days. Again on June 5, a blast was discharged under the open canal section in Owens Valley a few miles south of Lone Pine near the Cottonwood power plant. Slight damage was done and repairs were completed in a few days. Again on July 15, and July 16, two other explosions of dynamite in open canal portions of the Los Angeles aqueduct occurred, but did little damage, the most serious effect being to the side walls in the open concrete line section near Lone Pine. This damage was repaired within two days.

The claimants for reparations, who it was alleged were responsible for these acts, had refused to accept plans to file their claims in the courts and follow legal methods for collecting at law any damages proved to be suffered and which could be paid by Los Angeles. A reparations law was adopted by the California State Legislature in 1925, which provided that reparations claims must be filed in court by July 22. At that date no such action had been taken by the reparationists. The repairs which were effected by the Los Angeles Bureau of Water Works and Supplies indicated that serious permanent damage could not be done to the system by sporadic injuries and that repairs could be handled speedily and effectively under a wide variety of conditions.

BOSTON METROPOLITAN WATER SUPPLY. Work was actively in progress during the year for the Boston Metropolitan Water District on its project to develop additional water supply from the Swift and Ware Rivers. This project, which was estimated to involve some \$65,000,000, included a 25-mile tunnel extending westerly from the Wachusett Reservoir on the Nashua River. During the year the easterly half of this tunnel was begun and six construction shafts 310 to 650 feet in depth were sunk to tunnel grade and headings started. Bids were received for constructing the easterly half of the tunnel towards the end of the year and this work it was anticipated would soon be under way. To meet the growing demands for water for the Metropolitan District it was found necessary to divert water from several small tributaries of the Sudbury River into the existing system and a beginning was made on November 15 of such diversion of water.

KANSAS CITY, MISSOURI, AQUEDUCT. On Oct. 28, 1927, the Missouri Valley Water Tunnel, a concrete lined tunnel $7\frac{1}{2}$ ft. in diameter and 15,570 ft. in length, was holed through. This tunnel connects the 6-ft. Turkey Creek tunnel, extending to the Turkey Creek Reservoir and high-lift pumping station, a distance of 11,000 ft. The Missouri Valley Water Tunnel was constructed by means of a heading driven from each end and it was found necessary to timber the roof for almost the entire length. In the construction of the tunnel, gas was a serious difficulty and caused an explosion in which eight men were killed in the previous year. All machinery was required to be operated by compressed air and the lighting was done by a cap light with a closed type of electric battery or a permissible battery approved by the U. S. Bureau of Mines. A special type of dynamite had to be used and the work was attended with unusual difficulties. The practice pursued was to drive the heading in stretches of 1000 to 1500 ft. and then to place the concrete lining. It was expected that the lining, routing, clearing out and testing would be accomplished by Apr. 1, 1928, and the tunnel would be in service by May, 1928.

TORONTO WATER SUPPLY. During the year plans were drawn for an additional water supply for the City of Toronto, to cost over \$14,000,000. The work involved the construction of a tunnel beneath Lake Ontario having a capacity of 360,000,000 gallons daily, with steel conduits, extensions to a submerged inlet in 52 ft. of water, pumping and purification plants at the shore end of the tunnel, a long filter water tunnel extending the length of the water front to the main pumping station and beyond to a new pumping station, as well as a distributing reservoir and distributing system. The lake and land tunnels which were to be through shale were to have a combined length of 10 miles. Three steel laid conduits between the lake shaft of the tunnel and the intake exit were to be constructed, of which one with 150,000,000 gallons capacity daily was to be built at the outset. The land or filtered water tunnel was to have a capacity of 168,000,000 gallons daily up to the John Street station and 60,000,000 gallons daily for the remainder of its length. The lake intake tunnel and steel conduits were to extend from a combined high- and low-lift pumping station in Victoria Park and were to involve the tunnel 10 ft. in diameter and 3300 ft. long to a submerged shaft in 30 ft. of water from which ultimately three 8-ft. steel pipes 4250 ft. long with a capacity of 150,000,000 gallons daily would lead to a submerged intake in 52 ft. of water. As stated, only one pipe was to be laid at the start.

The filtered water tunnel was to consist of two portions, the first being a tunnel 7 ft. in diameter, with a capacity of 168,000,000 gallons daily, extending 30,500 ft. from the Victoria Park pumping station to the John Street high-lift pumping station, and a 6-ft. tunnel, 19,000 ft. in length with a capacity of 60,000,000 gallons per day to a new high-lift pumping station at Park-side Drive. In addition to these main tunnels an extensive system of new mains was also contemplated.

BEN NEVIS AQUEDUCT. In Great Britain a notable long water tunnel piercing Ben Nevis, the highest mountain, was under construction to convey water to a hydro-electric plant. This tunnel was 16 feet in diameter and ultimately was

to be 16 miles in length. Twelve side adits were driven at intervals throughout the length of the main tunnel and, when these reached the main tunnel location, boring was started in either direction until the next boring face from the adjoining adit was reached. In other words, there were 24 faces available so that more men could be put to work and the time for completing the job reduced. The principal construction feature was to provide adequate fresh air and to remove the fumes and dust produced by blasting. At each of the 12 adits a motor-driven fan drew the foul air through sheet metal ducts, away from the working faces, causing a constant circulation of the fresh air throughout the tunnel. These 12 fans moved about 300,000 cubic feet of air per hour and two additional fans were employed as boosters.

During the year the Public Works Department of Cuba had in progress plans for the construction of an aqueduct for the city of Havana. The estimated cost of this project was \$15,000,000.

See **WATER WORKS AND WATER PURIFICATION.**
ARABIA. A peninsula in southwestern Asia to the south of Syria, Mesopotamia or Irak and the Persian Gulf. The area is estimated at from 1,000,000 to 1,200,000 square miles, the higher figure including the Syrian desert and the Sinaitic peninsula. Estimates of the population range from 4,000,000 to 7,500,000. The divisions of the country in late years have been defined as follows:

(1) **HEJAZ.** Hejaz or the kingdom of the Hejaz was an outgrowth of the World War and after a very precarious existence was compelled to submit to the domination of the Sultan of Nejd at the very end of 1925. During its rather brief career as an independent state its frontiers were always in a state of flux, never being definitely defined excepting on the west. The estimated area of the country is about 150,000 square miles and its population variously estimated at from 800,000 to 900,000. The population is largely nomadic, although in recent years some villages have been settled where it has been possible to cultivate the soil successfully. The principal cities are Mecca, with a population of from 50,000 to 60,000 (this is the holy city of Islam, and attracts about 100,000 pilgrims annually; these pilgrims represent the chief source of income of the government); Medina, also a holy city and the seat of Mohammed's tomb, with a population of 15,000; and Jedda, the seaport for Mecca, with about 20,000 inhabitants.

Agriculture in the Hedjaz is not generally practicable, on account of the excessive heat, but in the oases there are large crops, the chief one of which is dates, and in the plateau region wheat, corn, barley, millet, lentils, coffee, and tobacco are raised. There are raised here the famous horses, many of which are sold abroad. The chief exports are hides, wool, and gum; the chief imports, foodstuffs and building materials. The King in 1927 was Ibn Saud, with the title King of Hedjaz and Sultan of Nejd and its dependencies.

(2) **SULTANATE OF NEJD.** This state is considered the most important unit in the Arabian peninsula and occupies the highland of central Arabia between the Persian Gulf on the east and the Hedjaz on the west. It is ruled by the Saud dynasty, which represents the old Wahabite empire, founded in 1745. In 1927 the popu-

lation was estimated at 3,000,000. The chief products of Nejd are dates, wheat, barley, fruits, hides, wool, horses, camels, donkeys, and sheep, while the chief imports are piece goods, tea, coffee, sugar, and rice. Reigning Sultan in 1927, Abdel-Aziz ibn Saud.

(3) **JEBEL SHAMMAR.** An emirate north of Nejd and since 1921 an integral part of the Sultanate of Nejd, by which it was captured and annexed. Population, estimated at 250,000. Capital, Hail.

(4) **ASIR.** The principality of Asir lies on the western coast between the Hedjaz and Yemen. Estimated population, 1,000,000; capital, Sabiyah. Since October, 1926, Asir has been under the sultanate of Nejd.

(5) **IMAMATE OF YEMEN.** The area of this state is about 75,000 square miles and the population is variously estimated at from two to three millions. The capital is Sanaa, with a population of about 25,000. Cereals and coffee are produced extensively. Hides form one of the chief articles of export. Ruling Imam in 1927, Yahya Mohammed Hamid ed-Din.

(6) **SULTANATE OF KOWEIT.** This territory subsidized by the British, is on the northwestern coast of the Persian Gulf, and has an estimated population of 50,000. Sultan in 1927, Ahmed ibn Jabir al Subah.

In addition to the above there are comprised within the limits of Arabia the British protectorate of Aden (q.v.) and the Sultanate of Oman (q.v.); also the emirate of Kerak or Transjordan (q.v.).

HISTORY. King Ibn Saud appeared to have completely established his predominance over all of Arabia. The year was comparatively free from revolts and one cause of friction was entirely removed by the signing of an agreement between Ibn Saud and the Imam of Asir, by the terms of which the Imam recognized the overlordship of the King in return for which he was allowed to regulate the internal conditions of his country during his lifetime, but was compelled to submit all questions dealing with foreign nations, especially concessions, to King Saud for his approval. At the beginning of the year there was a possibility of strife between the King and the Imam of Yemen, whose position had been considerably strengthened by a treaty with Italy signed in 1926 (see preceding YEAR BOOK). The cause of the trouble was largely the desire on the part of the Imam of Yemen to add the Imamate of Asir to his territory. International complications were involved because of King Saud's backing of the Imam of Asir and Italy's backing of the Imam of Yemen. The matter blew over without any bloodshed presumably because Great Britain let it be known unquestionably that further fighting would be unsatisfactory to her.

The annual pilgrimage to Mecca and Medina was attended by the largest numbers since 1924. The pilgrims were given the same courteous treatment and reduced rates which prevailed the preceding year and which apparently strengthened Ibn Saud's claim to the Caliphate. In connection with this claim to the Caliphate it might be mentioned that the King of Afghanistan publicly proclaimed his candidacy for the same title during the year.

In September, ratifications of a treaty signed between Great Britain and King Ibn Saud on May 20 were exchanged, in which the British

recognized the complete independence of King Saud's country and its dependencies. The treaty was mainly an expression of good will between the two countries and dealt partially with the protection and treatment of pilgrims on their way to the holy places. An unique provision was the promise on the part of the Hedjaz to do everything possible to suppress the slave trade.

ARBITRATION AND CONCILIATION.

See LABOR ARBITRATION AND CONCILIATION.

ARBITRATION, INTERNATIONAL. The general principle of arbitration had a steadily widening acceptance in the year 1927. In *Arbitration and the United States* (published by the World Peace Foundation, 40 Mt. Vernon St., Boston) 285 treaties in force or on the way thereto were listed, while 17 additional treaties were negotiated since the list was published. For several years few treaties of limited scope had been made and the additions referred to were all unlimited in the sense that they provide for the third-party examination of all disputes without exception by some form or some combination of conciliation, arbitration and judicial settlement.

The most interesting treaty negotiated during the year 1927, in the opinion of many, was the one between Colombia and Switzerland, which according to report leaves out of account the lesser and more or less aleatory methods of conciliation and arbitration and stipulates that judicial settlement is compulsory for all disputes arising between two countries.

The use of a compromisory clause in general treaties had become practically normal. One regularly expects to find it in all bilateral treaties that are not administrative or regulative of a particular point. The habit of including it had even reached London, and it had appeared in several recent treaties. The clause is standard in all multilateral treaties.

By June 15, 1927, the international engagements assigning jurisdiction to the Permanent Court of International Justice had risen to 202 in number, the documents themselves covering almost all conceivable subjects. The Court itself had just about kept abreast of its work. Its session began on June 15 with five matters pending and at the end of the year there were three pending, while the Council of the League was ripening one, and a second was apparently destined to go to the Court. A feature of the Court year was an increase of cases as compared with advisory opinions.

An interesting development was the application of arbitration in the Convention on Import and Export Prohibitions and Restrictions, held in Geneva, Nov. 8, 1927. This was the first international convention bearing directly upon international trade. It was a serious question whether arbitration should be applied at all to the interpretation and application of the convention. By insistence of most of the states represented a treble jurisdiction was provided for a form of advisory opinion upon disputes with appellate jurisdiction by the Court, some of the most important stipulations of the convention being excluded from this normal jurisdiction. By definite acceptance, however, a state can make those stipulations subject to either part of that jurisdiction.

AMERICAN ARBITRATION CRUSADE. A movement under this title was organized to educate the public to accept international arbitration as a substitute for war, and, during the year, it had distributed over 300,000 educational leaflets, including a proposed treaty drafted by Prof. Francis B. Sayre of the Harvard Law School. The particular method suggested by the crusade was that the United States should outlaw war by negotiating treaties with every other nation providing for obligatory arbitration or adjudication of all disputes that may arise between them. For five months the suggestion was made that the first treaty be made with Great Britain. Then came the proposal from M. Briand (see below), and those interested in the crusade at the end of the year were urging that the suggestion of the French Minister for an "outlawry of war" treaty with France be accepted.

BRITISH-AMERICAN CLAIMS. In 1927 there was no commission engaged in the adjudication of claims between the United States and Great Britain. Under the Agreement concluded Aug. 18, 1910, between the United States and Great Britain, which provided for the submission to arbitration of pecuniary claims outstanding between the two Governments, certain claims were scheduled for arbitration and a tribunal was created to adjudicate them pursuant to the terms of the Agreement. The last of the scheduled claims was disposed of by the Tribunal on Jan. 22, 1926. The American Agent submitted a comprehensive report regarding the arbitration to the Secretary of State on June 25, 1926. An arrangement was effected on May 19, 1927, by an exchange of notes between the United States and Great Britain providing for the disposal of certain pecuniary claims arising out of the recent war.

THE GENERAL CLAIMS COMMISSION (UNITED STATES AND MEXICO) held its last scheduled session on July 23, 1927. Of the 51 American claims which were heard and decided by the Commission during its existence, awards were made in 36. The total amount claimed by the United States in respect of these 51 claims was \$3,790,796.42. The total amount awarded on the 36 claims decided in favor of the United States was \$2,221,659.46. Certain of them draw interest. The Commission heard and decided nine claims of Mexico against the United States and gave favorable decision in five of these. The total amount claimed by Mexico in the nine claims was \$440,910. The total amount awarded decisions was \$39,000. Subsequently, however, an agreement between the two countries was entered into on August 15, to extend the life of the Commission for a time not exceeding two years from Aug. 30, 1927, the day when, pursuant to the provisions of the original agreement the functions of the Commission would terminate in respect of such claims. During the extended term the Commission was also bound to hear, examine and decide all claims for loss or damage accruing between Sept. 8, 1923, and Aug. 30, 1927, inclusive, and filed with the Commission not later than Aug. 30, 1927. It was agreed that nothing should in any wise alter or extend the time originally fixed in the said Convention of Sept. 8, 1923, for the presentation of claims to the Commission, or confer upon the Commission any jurisdiction over any claim for loss or damage accruing subsequent to Aug. 30, 1927.

The Special Claims Commission had not functioned since the resignation of its presiding Commissioner in 1926, no appointment to fill the vacancy having been made.

TRIPARTITE CLAIMS COMMISSION (UNITED STATES, AUSTRIA, AND HUNGARY). (See YEAR BOOK, 1926). The United States in 1921 negotiated separate peace treaties with Austria and Hungary in terms similar to those of the German treaty. These Treaties are respectively known as the Treaties of Vienna, Budapest, and Berlin, and respectively went into effect on Nov. 8, Dec. 17, and Nov. 11, 1921. The Tripartite Claims Commission was established in January, 1920, under the Executive Agreement signed on Nov. 26, 1924, by the Governments of the United States, Austria and Hungary, and became effective on Dec. 12, 1925. The Commission's duty was to determine the amounts to be paid by Austria and by Hungary on account of claims of American nationals similar to those against Germany adjudicated by the Mixed Claims Commission (United States and Germany); Judge Edwin B. Parker, of Houston, Texas, was the Sole Commissioner selected by the three Governments to pass upon the claims. The time for filing claims expired on Jan. 25, 1927, by which time 1631 claims were filed. Somewhat over half of the cases had been disposed of at the end of 1927 and the Commission hoped to wind up its task within six months. It issued administrative decisions disposing of most of the questions of Treaty construction, following generally the decisions of the Umpire (Edwin B. Parker) of the Mixed Claims Commission. The American Agent at the end of the year estimated that the awards would not exceed \$3,250,000 against Austria and \$750,000 against Hungary, including interest to date.

MIXED CLAIMS COMMISSION (UNITED STATES AND GERMANY). During the year there were 178 awards made to claimants and 198 claims dismissed. On Dec. 31, 1926, the amount of awards made against Germany totalled \$142,407,597.92. During 1927 up to and including Nov. 23, 1927, awards in the amount of \$6,682,448.98 were granted. Six decisions were rendered by the Umpire. Three awards and one dismissal resulted from these decisions and two of them were interlocutory decisions requiring additional evidence before a final determination could be made. The latter awards and dismissals based upon decisions of the Umpire were not included in the amount of awards and dismissals above stated. One of these involved a claim for physical impairment while a German prisoner, another the payment of a pre-war debt, and another dealt with a boat lost during the War.

TACNA-ARICA ARBITRATION. There were indications during the year that this difficulty (See YEAR BOOK for 1926) might be referred to the League of Nations for settlement, but no steps were taken to that end. Negotiations to settle the difficulties received another set-back in the middle of June, when Col. Rizo Patrón, the Chilean member of the Tacna-Arica Boundary Commission, resigned. The reasons given seemed to indicate that the member from the United States and the Peruvian Commissioner had desired to make some modifications of the rules of the commission, among which was a provision that two members might constitute a quorum; these modifications were opposed by

Colonel Patrón and an *impasse* resulted, as he refused to attend meetings of the commission.

Shortly after Col. Carlos Ibáñez assumed the office of President of Chile he announced a new and decided policy in regard to Tacna and Arica. The following instructions were issued to the Intendente of Tacna and the Governor of Arica:

1. It is the firm resolution of the Government to maintain in complete integrity its intention of arriving at the most complete and definite nationalization of the province. To this end it is essential that the Administration should take the form there of intensive nationalistic action, while at the same time rendering the sovereignty of Chile acceptable to all the inhabitants.

2. Severe and scrupulous order must be the rule in the public Administration, and for this it is necessary that all functionaries must possess qualities of competence and honesty calculated to make Chilean administration efficient and respected.

3. Careful attention must be bestowed on all the natives inscribed in the plebiscitary electoral registers, who have manifested with sincerity and enthusiasm their adhesion to Chile.

4. Foreigners who make propaganda against the national interests and against the integrity of our territory will be visited with all the rigor of the law. The Government is determined to expel at once from the province any disturbing element.

5. Every assistance must be given to Peruvians who dedicate their activities to work and who respect the established order, their rights and interests being protected in the most ample manner possible. This protection must be even more effective in the case of the indigenous population residing in the sub-delegations in the interior—people who, from their weak and timid character and ignorance, may be victimized by the unscrupulous.

6. Fundamental importance must be attributed to public instruction, so disposing without delay that its organization shall be patriotic in character, and in accordance with the following desiderata: (a) It is desired to stimulate civic culture by means of suitable lectures, selected readings from national history and press articles patriotic in spirit; (b) to apply strictly the legal prescriptions relating to obligatory primary education, so that no child shall fail to receive the seed sown in the Chilean school; (c) to further the work of secondary education, granting the directors of educational establishments the means and facilities necessary to convert the school into a pleasant and appropriate centre of reunion for the families of the scholars; (d) to make a special ceremony by the taking of the Oath to the Flag by the conscripts of the different regiments stationed in Tacna and Arica; the ceremony is to take place in the public plazas, in the presence of the pupils of all educational establishments; (e) on the anniversaries of the great battles of the Independence, of the combat of Iquique, of La Concepción, Tarapaca, Tacna, the taking of the Morro of Arica, the battles of Chorrillos and Miraflores and the entry to Lima, the flag is to be hoisted over the entrances to the schools with a ceremony at which teachers and scholars will be present, and a lecture must be given recalling the glorious event.

7. In difficulties that may arise between employers and employed, liberty of work must be guaranteed above all, as it is a sacred right; due protection being given, therefore, to workers desirous of returning to their duties.

8. In cases where these strikes or lockouts may prejudice communications with Bolivia, which are fully guaranteed by the treaty of 1904, the stipulations of that solemn treaty must be carried into effect, if necessary, with the assistance of the army, the navy, the carabineers and the police.

Señor Don Miguel Cruchaga notified the U. S. State Department on August 25 of his resignation as Ambassador of Chile and presented the name of Carlos Davila, editor of *La Nación*, as his successor. It was stated that the resignation of Ambassador Cruchaga and the recall of Señor Don Benjamin Cohen as Secretary of the Embassy could be attributed to "personal differences with the government of General Ibáñez." Back of the resignation and recall lay four months of friction over the Tacna-Arica problem. Señor Cruchaga had been a partisan of the policy of conciliation and cooperation with the American Government. President Ibáñez

had stood for the elimination of the United States from the arbitration, and the settlement of the dispute by direct negotiation between Chile and Peru. This programme it was quite generally believed had complicated an already difficult situation.

BRIAND PROPOSALS. On Apr. 6, 1927, the 10th anniversary of America's entrance into the World War, M. Briand, the French Minister of Foreign Affairs, sent a message to the American public through the Associated Press in which he suggested a treaty between the United States and France that would provide for "the outlawry of war" between the two countries. Minister Briand said in part:

"For those whose lives are devoted to securing this living reality of a policy of peace, the United States and France already appear before the world as morally in full agreement. If there were need for those two great democracies to give high testimony to their desire for peace and to furnish to other peoples an example more solemn, still France would be willing to subscribe publicly with the United States to any mutual engagement tending to outlaw war, to use an American expression, as between these two countries. The renunciation of war as an instrument of national policy is a conception already familiar to the signatories to the Covenant of the League of Nations and of the Treaties of Locarno. Every engagement entered into in this spirit by the United States toward another nation such as France would contribute greatly in the eyes of the world to broaden and strengthen the foundations on which the international policy of peace is being erected. These two great friendly nations, equally devoted to the cause of peace, would furnish to the world the best illustration of the truth that the immediate end to be attained is not so much disarmament as the practical application of peace itself."

This statement attracted but comparatively little attention in the United States until Pres. Nicholas Murray Butler of Columbia University in a letter to the *New York Times* on April 25, urged the United States to accept this offer. He said that such a statement from a French Minister was equivalent to a formal announcement by the French government. "The fact that this statement is addressed to the American public instead of formally to the government at Washington," he said, "rather increases than lessens its importance. . . . This question is now squarely before the people of the United States. If those moral forces to which Minister Briand makes appeal do not really exist among us, or, if existing, they cannot secure such direction of our policies as shall realize these ideals, then in international relations we shall have reached a stage which no American who understands his country's traditions and who realizes his country's ideals can look upon without shame and sorrow. Minister Briand's mind is thoroughly practical. . . . All that he asks is that the people of the United States shall take their own way to express the fact that in no case will they employ war to enforce their policies with reference to France."

In a speech before the American Club of Paris in June he further seconded M. Briand's plea for a Franco-American anti-war alliance, declaring:

(1) "France and the United States should agree firmly to renounce war as an instrument of public policy between themselves . . ."; (2) "Both nations should accept the Locarno definition of an aggressor as 'that nation which, having agreed to settle differences by arbitration and justice, proceeds to attack another nation without having done so . . .';" (3) "If there is a war of aggression we will not aid the aggressor."

"That is all," said President Butler. "Three short paragraphs, each of which can be learned by children in school."

The U. S. State Department was ready to begin negotiations with the French Government for a treaty renouncing war forever as between France and the United States. The official announcement was made that Ambassador Herrick had been instructed to inform M. Briand of the entire willingness of our Government to take up his suggestion. There was a statement from Washington to the effect that there really was no need of such a treaty with France, since the Bryan treaty amply covered the field into which the Shotwell-Chamberlain draft treaty for "the outlawry of war" ventured.

This statement that the Bryan treaty with France was still in force because it had never been formally denounced was misleading. Neither country, it is true, had formally notified the other that it regarded the treaty as no longer in force, yet both countries had allowed it to go by default. The Bryan treaties called for the appointment of commissioners to investigate and report upon any international controversy which could not be settled by diplomatic means. In fact the whole vitality of the treaty lay in the existence of these commissions. Until the Briand proposal they had virtually ceased to exist. The American representative on the French-American Bryan Commission was Richard Olney, who died April 9, 1915. The French member was Louis Renault, who died Feb. 9, 1918. Neither France nor the United States reappointed a representative until Sept. 12, 1926, when President Coolidge appointed Sen. Oscar W. Underwood as the American representative.

In the case of the Bryan treaty with Great Britain, the United States representative, Judge George Gray, died in August, 1926, and the British member, Viscount Bryce, died in January 1922. No appointments were made until Sept. 12, 1927, when the President appointed former Sen. Irvine L. Lenroot as the American national member and former Ambassador Jusserand as the American non-national member, which appointment was subsequently accepted.

Bulgaria's Minister in London was appointed the American non-national member on the Norwegian-American Commission and Justice Edwin Alten was appointed the Norwegian National member.

The only other countries with which the Bryan treaties were in full force and effect in 1927 were Portugal, Denmark and Sweden.

Three drafts were prepared to carry out the suggestion of M. Briand, one by the American Foundation, another by Francis B. Sayre for the Women's International League and the American Arbitration Crusade, and a third for the Carnegie Foundation. The latter, drafted by Professors Joseph P. Chamberlain and James T. Shotwell, of Columbia University, was built upon the already existing agreements which the United States has entered into with other countries. It takes up the problem of peace and from a different angle from that of the post-war controversies concerning either the League of Nations or the World Court. It goes back of these post-war discussions and bases its suggestions for the alternatives for war upon treaties made by the United States before there was a League of Nations or a World Court. The plans for international arbitration,

international justice and conciliation were based upon American precedent and repeated in large degree the texts of American treaties ratified, as it happens, under both Republican and Democratic Administrations. The Treaty of Arbitration which was incorporated in this larger draft was the work of one of America's greatest statesmen, Elihu Root, during the presidency of Theodore Roosevelt. It was modified seriously by the reservation inserted by the Senate and therefore represented both the ideas of one of the greatest secretaries of state and the cautions and reservations of senatorial action. On the other hand, the proposal for "conciliation" rests upon the work of Mr. Bryan under the presidency of Woodrow Wilson.

Both of these devices were set up before the post-war discussions and plans for world peace, and "vital interests, independence and the honor of the country involved," were excepted. As wars arise from questions of vital interest and national honor or the threat to a nation's independence, these treaties did not even so much as touch the supreme question of the renunciation of war between civilized nations. The Bryan treaties only called for "breathing space," during which investigations could be made; but the investigators were not even to risk suggesting any solution of the dispute because that would, according to the old ideas of sovereignty, be an interference with a nation's free choice of action in matters of vital interest.

No greater contrast to these partial measures of peaceful settlement and the complete renunciation of war as "an instrument of policy" can be found than in the Locarno treaties. In them, now the basis of the international law, between the Great Powers of Western Europe, war of aggression is renounced by all concerned, and only defense is legitimate—defense of other countries attacked by an aggressor as well as of the signatory itself. This last point of the recognition of the legitimacy of cooperative defense is a fundamental principle of the Covenant of the League of Nations and, as such, is recognized by the Locarno Powers because they are also members of the League. The treaties of Locarno, however, are very simple in the obligations they enforce. No Locarno Power can wage war on another in order to enforce its policy or to further its own self-interest.

The Chamberlain-Shotwell draft is similar to that of Locarno, which falls into three parts, the renunciation of war and provisions for arbitration and conciliation. The Locarno Treaties, however, have behind them the sanction of the League of Nations which makes them much more ironclad than this draft which attempts to state a compromise between American history and precedent and the new experiments of Europe. The greater degree of elasticity which is implied in the arrangement may ultimately offer some new suggestions for the solution of this world-old problem.

The American Foundation's draft took the form of a treaty suitable for universal application. It embodied the principle of arbitration and judicial settlement of a universal and compulsory character. Widespread opinion favorable to the omission of the clause excepting questions affecting "vital interests, independence or national honor" from the scope of any treaties signed was disclosed by the American Foundation. This omission of the traditional clause was

the chief feature of the draft treaty made public on May 29. The Foundation called attention to the fact that there existed but one precedent in the nation's treaty history for the omission of the "nullifying" clause. The exception was in the treaty of May 3, 1923, to prevent conflicts between the American States, the signatories being the United States, Brazil, Guatemala and Paraguay. This treaty provided for the settlement of "all controversies which for any cause whatsoever may arise." The Foundation observed in its statement that the treaty of May 3, 1923, was merely a conciliation treaty, but that the omission "has great point in representing a departure from an historic policy."

In commenting on this clause, John W. Davis, formerly Ambassador to Great Britain, said: "I think that the time is opportune for a campaign of education against the nullifying clause in our arbitration treaties. The exception from such treaties of questions affecting 'the vital interests, the independence or national honor' of the United States makes of the treaty little more than an agreement to arbitrate if, when and how we wish, and not otherwise. This much could be accomplished without any standing treaty of arbitration at all. No nation, presumably, will arbitrate, or would be asked to arbitrate, a question involving its national independence. This much of the qualifying clause is quite unnecessary. But no definition can ever be given of the phrases 'vital interests' and 'national honor.' They are broad enough to cover every subject on which any two nations might disagree or to which arbitration might be addressed."

The sentiment of those who had commented on this draft ran very much along the same lines.

Francis B. Sayre's plan provides for a series of treaties, covering even matters of national honor, vital interests, and the interests of third parties. It looks toward a greater use of the World Court than does either of the others. It gives jurisdiction over five kinds of disputes to that court, a plan closely related to the projects originally adopted by the Committee of Jurists for the establishment of the court.

As a part of the church programme for the Armistice Day period, a delegation of representative leaders, convened by the Federal Council of the Churches, waited on President Coolidge and the Secretary of State, on November 2, and presented a memorial urging the Government to accept the proposal of M. Briand. This memorial strongly urged also that this step be made the occasion for a declaration of policy that the United States desired to make similar treaties with all other nations. This memorial signed by over 700 churchmen, was presented by a committee headed by Bishop William F. McDowell of the Methodist Episcopal Church. It set forth that the signers believed that the American Government should coöperate to the fullest possible extent with the other nations of the world in taking effective steps toward the substitution of peaceful methods for those of force in the settlement of disputes between nations, and therefore, heartily welcomed the proposal of M. Briand that France and the United States should make mutual engagements for the renunciation of war as an instrument of national policy. It further set forth that the signers believed that war should never again be

resorted to by civilized nations as the means for settling disputes or enforcing claims; that war, save for self-defense against actual attack, should be outlawed and declared by the nations to be an international crime; that the renunciation of war by treaties and solemn engagements should be undertaken between all the principal nations, adequate provision being made for conciliation, mediation, arbitration and judicial settlement; that such engagements constitute an essential measure in creating the spirit of mutual confidence which must precede a general movement for disarmament; and that the settlement of every threatening dispute, whatever its nature, should be sought only by pacific means.

In connection with the Briand proposals it was interesting to note that he was to be one of the speakers at the Centenary Meeting of the American Peace Society.

ARBORETUM, NATIONAL. See AGRICULTURAL LEGISLATION.

ARCHÆOLOGY. If possible an intensified interest in archaeology was apparent during the year 1927. The chief fields of activity were Egypt, Mesopotamia, Syria, Greece and Italy. It is especially to be noted that there was an awakened enthusiasm for exploration in the Bible Lands.

Italy was continuing aggressively her work in Cyrenaica. At Slonta, in the "Grotto of the Images," the most interesting finds have been made in the way of relief sculptures. All the lower walls were ornamented with human heads combined with animals and serpents. All were cut in the primitive style familiar from the anthropomorphic vases from the Troad. In Cyrene itself excavations were still going on. The most important discoveries are connected with the temple and altar of Apollo which date back to the time of the founding of the city. The construction of the building employed brick and wooden beams much in the fashion of the Minoan palaces at Crete. The altar proved to be 70 feet long thus making it one of the largest known in the Greek world. Other places excavated by the Italians are Sabratha and Leptis Magna. Sabratha is largely Roman and Christian while Leptis Magna is Roman.

In Egypt at Giza the expedition sent out by Harvard University and the Museum of Fine Arts in Boston has been occupied with work on the tomb of Hetepheres, the mother of Cheops. When opened on March 3 the sarcophagus was discovered to be empty. Shortly after this a concealed recess was discovered on the west wall. In it was found an intact burial which gave the first chance in Egyptian exploration to examine the burial of an important individual of the early dynasties. The tomb was a secret one located at the bottom of a shaft about 100 feet deep which had been filled up after the interment. A doorway cut in the rock led to a tomb of an Egyptian princess, Queen Meresankh. She was the granddaughter of Cheops.

At Karanis in the Fayum district the University of Michigan expedition under the control of the late Professor Kelsey found some interesting material. A small hoard of gold coins of the second century A.D. came to light and in addition a couple of letters written home by a lad who had gone into military service in Italy. Since the boy could not write he em-

played two different scribes to compose his epistles for him. There is a modern touch in them in the tone of homesickness that pervades them. Of particular interest among the finds was a waxed tablet which still preserved its writing in excellent condition. It is a legal document in which a woman certifies to the birth of twins.

Also in the Fayum, near Lake Karun, was discovered a cave which contained human remains together with fossilized fish and long, sickle-shaped scrapers. In the western desert in the Kharga Oasis the Egyptian Service found a necropolis.

At Luxor the Liverpool University expedition has uncovered a long corridor vaulted with brick and north of it an enormous sarcophagus which apparently was for the mummy of the sacred bull. The sarcophagus, of sandstone, is eleven feet long, eight wide and ten high. The lid is two feet thick. The tomb had been rifled.

The French Institute of Oriental Archaeology has been busy at the temple of Madamna where many statues of Senuwrit III together with many inscriptions came to light. These finds show that the temple belonged to the 12th dynasty. The clearing of the Ptolemaic temple and the Roman buildings associated with it uncovered a sanctuary over 120 meters in length and 52 in breadth. The building had been commenced by Tiberius and was completed by Antoninus Pius.

At Memphis the Antiquities Department of the Egyptian Government discovered a tomb of the third dynasty. It is located at Sakkara and may prove to be the earliest yet found in Egypt. It lies within the boundary wall of the Step Pyramid and was well concealed. There is a possibility that it may prove to be the tomb of Im-hotep, the architect of King Zoser. A stairway of 100 steps led down to the tomb. Other stairways and tunnels led from the main tunnel to a series of underground rooms, the walls of which were sheathed once with blue tiles. Among the interesting finds in these rooms is a portrait of King Zoser.

The most important find of the Egyptian Exploration Fund at Tell el-Amarna is a hall in which Akhenaten dedicated to Aten the tribute he received from Asia and Nuclia. Explorations in the houses of the town have illuminated the conditions of living in the time of Akhenaten. The walls of the bedrooms were very thick to keep out the heat. One house had a bathroom and in another dwelling was found a statue of the goddess Taurt showing that the king had not succeeded entirely in wiping out the idea of polytheism.

Near Thebes the French have uncovered a temple called "Sacred Lake." One of the most interesting finds occurred in the Temple of the Ptolemies where portions of a very old building came to light. Therein were bas reliefs representing religious ceremonies and one long inscription of an historical nature. It is thought to be the first monumental material found dealing with the 13th dynasty.

In the winter of 1926-27 work was carried on in the innermost recess of the tomb of Tutankhamen. It was found to be filled with every conceivable object. The dimensions of the room are 15 x 12 feet and 8 in height. In this small room everything was as the workmen had left it. Among the objects found were emblems of

the underworld, boats, chariots, etc. The most interesting of the finds were boxes in which were the king's decorations and jewelry, his toilet articles and slippers. Besides these there were found over 30 fine statuettes. Most unusual was the finding of the ostrich plume fan of the king in practically perfect condition. The workmanship of the handle is most delicate.

Palestine in 1927 received a great deal of attention from archaeologists. Beisan, the Bethshan of the Bible, was excavated by the University of Pennsylvania. Up to the end of 1927 work had centred on Tell el-Hosn where eight levels had been investigated. The time covered by these strata runs from before the period of Amenhotep III down to Arabic times. The lower part of the upper level of the stratum dating before Amenhotep lies 37 feet below the present ground level. Two new Canaanite temples were discovered. A door jamb with the portrait of the builder of the temple of Dagon, Rameses West-Khepesh, came to light. From the lower pre-Amenhotep level came many interesting finds—considerable finely decorated pottery showing affiliations with the Mediterranean, portions of the trunk of a date palm showing that at that time this tree was growing at Beisan, a bronze trumpet mouth resembling the one of silver from the tomb of Tutankhamen and five steps belonging to a small Canaanite temple.

In the stratum of the time of Rameses II the digging revealed two Canaanite temples, one dedicated to Ashtoreth the other to Reseph. In the latter was found a small bronze figure of a seated god covered with gold leaf. A lapis lazuli scarab gives the time 1970-1935 B.C.—the time of Sesostrius I. In the early Seti I st. level 30 rooms have been cleared. In one of them was a large quantity of corn. In the level of Rameses II were found nine bricks showing the imprints of the feet of a small child and those of the paws of a dog and the front hoof of a gazelle. Among the other finds to be mentioned are the heads of an elephant, a bull, a dwarf god and the goddess Ashtoreth. Very important was the recovery of a cylinder seal with three lines of Babylonian script stating the following: "Manem, the diviner, the servant of the god Enke." It dates about 1819 B.C. In addition there turned up a Cypriote bowl to the surface of which adhered gold dust. Also was found a splendid double pointed spear—but which probably was the property of some Mediterranean mercenary of the time of Amenhotep III.

At Gaza, Petrie working for the British School found a massive wall 27 feet high on the north side of the city mound. The upper courses may date about 1400 B.C.

The British in the winter of 1926-27 excavated the site called Tell Jemmeh. The town of Shishak was found under the town of the time of the Jewish kings. In all six cities were cleared dating from 1500-400 B.C. About 1200 appeared furnaces for smelting. Picks, hoes, and ploughshares turned up. No gold was found except nine earrings. Except for one these dated about 1200 B.C. The town of Shishak was well built. In several houses were jars containing jewelry.

El Qudah, the Hazor of the Bible (Josh. xi. 10-13) was a stronghold of the Canaanites destroyed by Joshua. It was a fortified camp capable of holding 40,000 to 50,000 men. Within the enclosure the excavations revealed one or

two buildings and fragments of basalt columns. The site was occupied mostly in the bronze age. The Canaanite culture came to a close about 1200 B.C.

The 1926-27 work at Jerusalem made possible the identification of the third wall. Near to the American School was a large rock scarp which was uncovered near the gateway by the tower which is identified as the Tower of Women referred to by Josephus.

The Harvard University Expedition was at work at Samaria. It was found that the city was originally built by Omri (I Kings, xvi, 24). The excavators discovered the palace of Omri and the "Ivory Palace" of Ahab. The private houses were made of cut stone as described by Amos. An important find was that of 61 pottsherds inscribed with the accounts of the palace. They are written in the old Hebrew alphabet.

At Sheikh Sa'ad in the Hauran the Czechoslovakian Mission continued its excavations begun in 1924. This is the site of Karnaim of the Old Testament, and contained Hellenistic sculptures cut in basalt. Also the sanctuary of Job was cleared. Its construction followed the rule in the Hauran of using flat slabs of stone for the roof. The so-called "Stone of Job" proved to be a stele of Ramesses II.

On the site of ancient Mizpah excavations revealed the remains of an old Semitic temple and the parts of an earlier structure under it. In one of the rooms of the temple came to light some flint knives which were used in religious ceremonies. Nearby were found cups and bowls to hold offerings. Beneath this room in store-rooms and in caves were recovered different kinds of pottery together with tomb deposits belonging to the days antedating the time of Abraham. Seven miles north of Jerusalem, at Tell en-Nasbeh, were found walls of tremendous strength, dating probably about 1800 B.C. The top of the hill was encircled by a wall which averaged 16 feet in thickness and in places rose to a height of 25 feet. The enclosure amounted to about eight acres. In this area were found circular grain pits about 5 feet deep and 3 to 4 wide. Nearby were nine rock-cut cisterns in which were lamps and bits of jars which had accidentally been dropped in the wells when the women of the place were drawing water. The place was occupied in the period of the exile.

At Jemdet Nasr, 17 miles to the northeast of Kish in Mesopotamia, has been found a quantity of wheat contained in a red and black jar. This is the only instance of cereal ever found in early Mesopotamian levels. The date is around 3500 B.C.

The expedition sent out by the University of Pennsylvania and the British Museum was most successful. The work was carried on in the cemetery at ancient Ur. The topmost levels brought to light graves dating around 2600 B.C. Cylinder seals bearing the names of the household of the daughter of Sargon of Akkad afforded the date. Just below these graves were similar but earlier ones, in which the bodies were placed in basket-weave coffins or merely laid in holes that were lined with matting. In this level came to light the lapis lazuli seal of Nin-Kur-Nin, the wife of Mesannipadda who founded the first dynasty of Ur. This level of graves dated from 3200 to 3100 B.C. The next lower stratum of burials was still older, and richer in material. Here were found tablets

written in a semi-pictographic style and seals carrying the names of kings whose names were previously unknown. This level dated about 3500 B.C. The most recent discovery is the burial of Meekalamdud, a prince of the royal blood living about 3500 B.C. The body was found at a depth of 25 feet, and not in the usual basket coffin or simply wrapped in matting, but in a heavily built tomb of rough limestone. The walls were over 3 feet in thickness. The roof was an arch of corbelled stones which were supported upon wooden beams. There were two chambers, the outer one for attendants who seem to have been buried with the prince, the inner for the King himself.

The tomb had been rifled in antiquity. In the inner chamber only a few beads and instruments were found. In the outer chamber was one body still with its head ornaments of gold and silver and strings of beads. Beside another was a heap of copper vases and one silver bowl with fluted sides. Another find was a copper rod standing upright in the soil marking the shaft of the tomb at the bottom of which were found stone and copper vases. In the shaft was found a spear with a bronze head and a gold-mounted shaft standing upright at the corner of a coffin. Against each end of the coffin were spears upright in the ground. Beside it were vases of steatite and alabaster. At the foot was discovered a corroded mass of vases and bowls from which three of silver have been recovered.

Earlier discoveries on the site of Ur belonging to this year's results are, between the joint temple of the god and goddess of the moon, a door socket bearing inscriptions of King Marduk-nadin-ahi (1117-1100 B.C.), and a casket lid with the first Phoenician inscription found in Mesopotamia. One cannot leave the subject of these excavations before recording the discovery of the remarkable golden dagger with its fretwork sheath also of gold found on the site.

At Athens in Greece on the site of the royal stables has been found a beautiful fourth century vase about a foot in diameter which had been used as a funeral monument. It contained human bones. On the site of the Odeum of Pericles further investigations were carried on. At Corinth two groups were at work; one under the direct care of the American School, the other a more or less private undertaking of Professor Shear. The School worked chiefly on the Lechaion Road and in the Odeum. On the road the chief effort was to clear it as far as possible. Some coins were found dating as late as the tenth century of our era. Generally speaking, the Lechaion Road was found to be in good condition. In the Odeum the *caves* was laid bare.

Perhaps more interesting than these results were those of Professor Shear. In the theatre he uncovered a series of pictures of athletic and acrobatic feats painted in bright colors on a high wall which surrounds the orchestra. The floor of the orchestra itself was covered to a depth of 40 feet with earth. The chief figure is represented with red boots and a purple coat giving the suggestion that here perhaps is represented some emperor. This figure is represented in the act of spearing a huge lion behind which is a gladiator in the conventional short costume of that class. Coins found dating in the fourth century show that the theatre

was not rebuilt or re-used after the destruction of Corinth in 396 A.D. Among the other finds were a colossal draped male statue covered with its original pink paint and a splendid head of a youth which preserves traces of dark red in the hair, on the lips and on the irises of the eyes.

Work was resumed in Crete chiefly at Knossos by the British School and at Gortyna by the Italians. In the latter place the excavation of the Roman *Prætorium* was carried on. The palace of the *proconsul* was shown to be the largest and most luxurious residence of any provincial magistrate in the east. The building was flanked by a splendid portico of Corinthian columns 3 feet in diameter. The building was equipped with every comfort such as porches and corridors to afford protection against the heat, baths, etc. The latest digging revealed an apse and a tribunal in which was a statue of Justice. Near St. Theodore a group of pre-Mycenaean buildings was found. Near to the sea was a large square structure in which were found jars containing Mycenaean inscriptions. This place was possibly the port of Knossos. At Epidaurous, Cavvadios has cleared the Double Portico.

At the Heraion in Argos, Blegen carried on his second campaign which resulted in the discovery of seventeen Mycenaean chamber tombs. From the digging a mass of new important material came to light. The tombs date from the time of the shaft graves at Mycenæ down to the transition from the Mycenaean to the Geometric period. All the tombs are of the well-known type with dromos, doorway and chamber. There was an average of 10 burials in each tomb. Among the objects found were ivory combs, and ornaments and a dozen knives and daggers, spearheads, arrowheads, and mirrors.

At Locris near the little harbor of Hagios Constantinos the precinct of Konaion Zeus was explored. It has a curious pentagonal shape with its southern wall following the curve of the beach at a distance of about 50 paces. The towers and parts of the adjacent walls are built of blocks of poros. The rest of the walls are of smaller volcanic stones laid to produce a thickness of three meters. No pottery before the fourth century was discovered. From then it continues until the Græco-Roman times. At Nicopolis excavations were carried on in front of the gate of the basilica of Doumetios (3rd century A.D.). The whole of the west side was cleared. Work also was done in the precinct of Augustus. Here four new blocks of the important inscription on the side of the building were found. At the Amphiareion at Oropos work was done on the Portico with Fourteen Columns and in the theatre.

In Italy in the valley of Aricia remains of a very early temple were discovered. Here were found abundant deposits of votive offerings of the fourth to the third centuries. At Bolsena a Roman villa was excavated in which are preserved some traces of decoration. The most important find was a small bronze variant of the Doryphoros type. At Cumæ progress has been made in clearing the Grotto of the Sibyl and a companion approach cut in the rock under the temple of Apollo. In Sicily at Girgenti two beautiful archaic Greek altars have been found by Captain Hardcastle. They are near a temple of Castor and Pollux. One is square in shape

and 15 feet on the side, the other is circular and 25 feet in diameter. Around the latter are graceful terra cotta figurines. In the temple of Zeus more fine fragments of a colossal figure were recovered. The figure belongs about 470 B.C.

Excavations were begun at Herculaneum in May. As the old level is about 80 feet below the present ground level and the covering mass is a hardened volcanic mud the tremendous labor involved can be appreciated. To cut this hard stuff pneumatic drills were being used and much progress was made. The locality chosen for the first work is near the house of Argus from which previously the finest frescoes from Herculaneum have been recovered.

The *cavea* of the theatre at Ostia was cleared and completely restored. During this work all the rooms on the fourth side of the *Piazzale delle Corporazioni* were found. Close to the spring of Acquaria near Paterno was located an interesting necropolis of the third century A.D. The burials are in the rock with *arcosolia* and a series of tombs in concrete.

Work was being pushed at Pompeii in the Via dell' Abbondanza. Among the finds are to be mentioned a bronze statuette of Apollo, one of a girl, and a chiselled cup of silver. The latter was discovered in the carbonized remains of a wardrobe. Besides these were found many wall-paintings in the seventh *insula* of region one. Here were some of the richest homes in Pompeii. In this quarter the house of P. Cornelius Tages was cleared. This man was a notable person. It was also found that his home, The House of the Bronze Boy, is most irregular in plan, due to the fact that the owner with increasing wealth acquired neighboring buildings which he combined with his own. In this house of Tages there are over 20 rooms on each of the two floors. In the two dining rooms were found some very interesting wall-paintings—some mythological, others purely decorative. The most interesting are the Egyptian landscapes in the summer dining room. Between the house of Tages and Paquinius Proculus were discovered three smaller but equally elegant houses of which one belonged to the priest Amandus. In it in a corridor were found the skeletons of nine people who had been overcome by the gases and ashes of the eruption. From the splendid dining room of this house came some of the finest frescoes. Among them should be mentioned Hercules in the Garden of the Hesperides, the Meeting of Galatea and Polyphemus, the Rescue of Andromeda and the Flight and Fall of Icarus.

Near the Villa of the Quintilii in Rome was found a fine head of Dionysos in the archaizing style. It has been suggested that it may be a copy of the lost work of Alcámenes the contemporary of Phidias. At the foot of the Quirinal stupendous foundations were uncovered. At Hadrian's villa statues of dancing *mænads* in the style of the Hellenic period have been discovered; also a replica of the Crouching Venus of Dædalos of Bithynia. Another find is a fine Greek head of the fifth century Greek type.

In the island of Elba were found a number of tombs which are thought to belong to the Trojan War period. They are located near the Porto Ferrajo. The structures consist of roughly hewn slabs of slate. In each were skeletons.

Not far from the village of Puente Mayorga near Gibraltar was discovered a marble sarcoph-

agus of the strigillated type. It is believed to be of Phœnician or Roman origin. The site on which it was located is the necropolis of Carteia.

In the island of Minorca a group of prehistoric monuments were investigated. They are (a) great stone mounds called "Talayots" and (b) stone monuments shaped like the Greek tau and called "Taulas." It was learned that there is no connection between these and the nurhags of Great Britain. They stand without parallels. The Talayots appear to have been funeral pyramids and the Taulas sacrificial altars.

At Radenac in France was discovered a Roman fort with stonework and walls 600 feet in diameter. The place was destroyed by fire. The discovery of iron lances and other objects show that the fort was an important one.

The most notorious discovery of the year in France, if measured by the acrimonious discussion that arose over it, was the finding of what has been held by some to be relics of the neolithic age, found at Glozel near Vichy. The find consisted of a few polished axes, pebbles decorated with outlines of animals and inscriptions, perforated pebbles, flat rings of polished hard stone, harpoons and needles of horn, crude clay vases and some 50 clay tablets covered with alphabetiform signs. Those who defended the genuineness of the finds pointed to the resemblance that the signs bear to Phœnician and Iberian scripts and to the parallel that the sculptured forms offer to those of the stone age in Portugal. These advocates say that the finds represent the transition from the palæolithic to the neolithic age and that in view of the evidence offered the palæolithic age must be put much later than it is now. On the other hand the skeptics pointed to traces of glycerine in the bottom of the scratches and reject the whole thing as a "plant." At the end of the year a group of scholars were endeavoring to determine the truth of the matter.

In England on the site of ancient Kanavium a Roman fort has been excavated. Originally the place was surrounded by a clay bank with a double ditch outside the bank. The fort dates in the first quarter of the second century of our era. At Olford near Sevenoaks the ruins of a small summer villa of the first to the second century were cleared. The place was destroyed by fire. Recent excavations on the site of Uriconium at Wroxeter in Shropshire revealed the largest building of Roman date yet found in England. It was the market place of the town erected by the Emperor Hadrian. Many other buildings were unearthed and all showed traces of burning. Several skeletons were found one of which was in an "hypocaust." In its hand was a box which once contained the coins which were found spilled on the ground nearby. These coins date from the third year of our era. Other discoveries were the tracks of Roman sandals in the soft cement, a steel cock's spur and a surgeon's lanpet. In the Isle of Wight was found a Roman villa from which considerable pottery and some coins were recovered.

At Toaszeg on the river Tisza in Hungary were found evidences of bronze age habitations. The material consisted of the remains of hut-floors and fragments of mud that had fallen from the burned wattle and daub walls of the huts; the accumulation of the debris of succeeding settlements that had been built on the

site. The mound before excavation was about 14 feet in height. The place, as indicated by the potsherds and implements, was occupied for about 1000 years. The exploration of the site was carried on by a joint expedition sent out by Cambridge University and the Hungarian National Museum.

It is interesting to note that the lowest layers of the mound show the influence of Asia Minor culture, such as is revealed in Cyprus and the Troad. The site thus seems to be on the road followed by those adventurers from the Mediterranean who pushed north in quest of gold. See ANTHROPOLOGY.

ARCHERY. The 47th annual tournament of the National Archery Association of America was held at Boston in August, the men's championship being won by P. W. Crouch of Newton Center, Mass. The result was determined by adding together scores and hits in both the Double York and Double American rounds. R. P. Elmer of Wayne, Pa., captured the Double American Round but Crouch had sufficient lead in the Double York Round to offset this reverse. Mrs. Robert Johnson of Los Angeles, Cal., carried off the women's title after a close struggle with Mrs. Dorothy Cummings of Brookline, Mass., the defending champion. The championship for boys, under 16 years of age, went to Ware Lynch of Greenwich, Conn.

ARCHITECTS, THE AMERICAN INSTITUTE OF. The national organization of the American architectural profession, founded in 1857. It is governed by officers and a board of directors elected by and responsible to the delegates from the 58 chapters, assembled at the annual convention. The objects of the Institute are to organize and unite in fellowship the architects of the United States, to combine their efforts so as to promote the æsthetic, scientific, and practical efficiency of the profession, and to make the profession of ever-increasing service to society, and to spread an understanding of art and service among the people. Its activities include, devising methods for improving and extending architectural education, not only in the universities, but in the lower schools; securing proper laws for the registration of architects in the various states; developing a service for architects which will give them for their actual problems data relative to building materials and methods obtainable from no other source; maintaining a public information service to tell the prospective builder the financial as well as the æsthetic service of the architect. The Institute maintains active standing and special committees on various branches of its work and allied fields. The directors and executive committee hold quarterly meetings in various parts of the country and the regional directors keep in active touch with the work of local chapters throughout the year.

At the 60th annual convention of the Institute which was held in Washington, D. C., May 11-13, 1927, a large measure of attention was given to the discussion of architecture as an art and to the development of a plan for bringing about real working collaboration between the architect, the landscape architect, the painter, the sculptor and the craftsman. The Board of Directors reported the completion of arrangements for the French Traveling Fellowship, and the receipt of \$1500, the gift of Julian Clarence Levi, to meet the expense of bringing

the first appointee, Marcel Gogois, from France to the United States to study. Recommendations were made by the Committee on Public Information relative to the constructive development of the publicity system inaugurated in 1926, and another report was rendered, by the Committee on the Plan of Washington and Environs, calling upon the local chapters to do their part in influencing Congress to effect certain improvements to insure the future greatness of the national capital. George C. Nimmons submitted a report on the art courses given under the grant of the Carnegie Corporation, by which the Institute received \$10,000, which enabled the Committee to invite 21 colleges to take courses at the Art Institute in Chicago. Under this plan colleges were invited to send to the Institute their best art teachers, to receive a special intensive course in the fine arts, which they in turn reproduced in the following year to the students of their institutions, in an effort to educate the public to a more intelligent interest in and knowledge and appreciation of architecture and the other fine arts. It was reported that the Carnegie Corporation had again granted \$10,000 for carrying on this work in 1927, to be given at Harvard University instead of at the Art Institute in Chicago. In addition to the reports of the various committees, numerous lectures and addresses were given. Richard G. Bach, of the Metropolitan Museum of Art in New York, addressed the Institute on "American Industrial Art"; Wilbur Watson spoke on "The Historical Development of Bridges"; and Charles Moore delivered an address on examples of collaborative achievements in architecture.

The endowment fund capital of the Institute amounted to approximately \$75,000, the income from which was devoted to the maintenance of the Octagon House in Washington; the property and funds totaled \$255,055.63, of which \$46,170.16 belonged to the Waid Education Fund, the income being used to defray expenses of lecturers sent out to various states and to preparatory schools. An additional \$3000 was added to this fund through the gift of D. Everett Waid. The Allied Art Medal of the Institute was awarded to Les Lawrie for distinguished achievement in sculpture and the Craftmanship Medal to Frank Holmes for distinguished achievement in ceramic art. The initiation fee of the Institute was raised to \$25 which was in addition to a yearly membership fee of \$25. The membership numbered more than 3000 of the 10,000 practicing architects in the United States. Georges Gromort of Paris, Ludwig E. E. Hoffman of Vienna, and Ragnar Östberg of Stockholm were made Honorary Corresponding Members, while 15 Honorary Members and 10 elections to Fellowships were announced. Officers for 1927-28 were: President, Milton B. Medary, Philadelphia; first vice president, William Emerson, Boston; second vice president, O. Herrick Hammond, Chicago; secretary, Frank C. Baldwin, Washington; treasurer, Edwin Bergstrom, Los Angeles. The Institute publishes: *The Journal of the American Institute of Architects*, a monthly; *The Handbook on Architectural Practice*; *A Structural Service Book*; *The Significance of the Fine Arts*; the Standard Contract Forms, which are in widespread use throughout the country; and documents on the ethics of the profession. Its

headquarters are located in the Octagon House, Washington, D. C. Next to Mount Vernon and Monticello the Octagon is probably the finest of the old colonial homes near Washington having historical significance. It was built in 1798 for William Tayloe, designed by William Thornton, architect, and occupied by President Madison and his wife, Dolly Madison, during 1814 and 1815, while the White House was being restored. The Treaty of Ghent which concluded the War of 1812 was ratified by President Madison in the Round Room of the Octagon on Feb. 17, 1815.

ARCHITECTURAL LEAGUE OF NEW YORK. See ART EXHIBITIONS.

ARCHITECTURE. The year 1927 witnessed a distinct falling off in the total of building, except in Germany. Nor was any great or climactic building completed which would make the year famous. Even the great competition for the League of Nations Building at Geneva petered out to a conclusion that was political rather than architectural. (See below.)

AMERICA. The sweeping construction of speculative buildings, both for offices and housing, that characterized 1926 diminished greatly in 1927, as complaints of overbuilding, particularly in the more expensive hotels and apartments, were arising, and vacancies increasing. The mortgage money market for this type of work tightened greatly, and many projects were abandoned. Certain large buildings of this type were, however, brought to a conclusion. The Savoy-Plaza Hotel by McKim, Mead and White, and the Sherry-Netherlands, by Schultze and Weaver, both in New York, on either side of 59th Street at the Plaza, were the most notable. The former is in a dignified Renaissance style, with an arcade of powerful scale at the street level, and a steep pitched roof of green tile, that adequately crowns its white brick walls. It is a design of great distinction, and forms an admirable decoration to the Plaza on which it stands. The Sherry-Netherlands is less monumental, more picturesque, with a high slim tower capped by a steep roof and a sharp gilded fleche. Together the two make a group remarkably effective as seen across Central Park.

During the construction of the Sherry-Netherlands, when the steel was almost completed, and the masonry largely finished, the scaffolding surrounding the ten upper floors caught fire in the evening and burned with terrific heat and intensity for four hours. The standpipes in the building not being completed, it was impossible for the fire department to put water on the blaze, which could only burn itself out; in the process flying embers and burning planks set many local fires and did great damage to surrounding roofs. The damage to the structure itself was estimated at nearly \$250,000: unprotected steel work warped and twisted, and much brick and terra cotta was ruined. Structural members already fireproofed suffered little damage, however. The fire brought up the importance of the whole question of adequate protection of high buildings during construction. It was obvious that such fires have enormous potential danger; standpipe fire lines must be completed floor by floor as the building rises.

The Royal Hawaiian Hotel, at Honolulu, T. H., by Warren and Wetmore is the typical lavish resort hotel, with a standard plan and much rather heavy and diffuse ornament.

NOTABLE ARCHITECTURE OF 1927

Commercial building felt the stringency less than housing. In New York, the Graybar Building, by Sloan and Robertson, has a mass of considerable dignity, and much interesting detail of modernist type, particularly around the entrances, which are crowned with colossal low relief figures. The whole is, however, incoherent and not sufficiently studied, and gives evidence of that haste which is the curse of American commercial architecture. The Salmon Tower, by York and Sawyer, is distinguished only by its size. The American Book Co. Building, by Necarsulmer and Lehlbach, is an interesting adaptation of Renaissance. The two most remarkable New York office buildings of the year are those of the Equitable Trust Co., by Trowbridge and Livingston, and No. 2 Park Avenue, by Buchman & Kahn. The former has an interesting composition of forms that pyramids effectively; the latter is distinguished by its masterly modernist ornament and its daring use of brilliant color in the upper stories.

Outside New York, the Russ Building, San Francisco, by George W. Kellam, has fine mass but inadequate Gothic detail; the Niels Esperson Building at Houston, Texas, by John Esperson, is in a conventional classic style, and is one of many that make the thinking observer doubt the economic and æsthetic validity of the skyscraper in places where it is not a necessity. The Baker Building, Minneapolis, Minn., by Larson and McLaren, is an interesting composition of strong vertical lines, and the Maccabees Building at Detroit, by Albert Kahn, one of the best of recent adaptations of Gothic forms to modern commercial use.

The most interesting of the year's skyscrapers outside of New York is the American Insurance Union Citadel, at Columbus, Ohio, by C. Howard Crane and Kiehler and Dore Associated. Its style is an exceedingly free classic, and its composition an interesting combination of strength and slowness; its domical top fresh and well handled.

Of commercial buildings not in the skyscraper class, The State Bank & Trust Co., Evanston, Ill., by Childs and Smith, has lovely free classic detail of unusual grace and delicacy; inside it boasts of a beautiful ceiling in the style of Raphael or Giulio Romano. The Hollywood Terminal and Warehouse Building in Hollywood, Calif., by Morgan, Wells and Clements, is a beautiful synthesis of simple vertical lines with a decorative cresting crowned by high wireless towers. The Massachusetts Mutual Life Insurance Co.'s Home Office Building, Springfield, Mass., by Kirkham and Parlett, is an enormous building around two courts, with an entrance portico and a cupola, in a quiet colonial style, adequately if conventionally detailed.

The most remarkable building of this style is, however, that of the Fidelity Mutual Life Insurance Company in Philadelphia, by Zantzinger, Borie and Medary, with sculpture by Lee Lawrie, a most impressive and monumental whole, with detail of the greatest interest. In its modernist treatment of ideas essentially classic, it shows the influence of Goodhue's Nebraska State Capitol.

If, on the whole, speculative building showed less of interest in 1927 than before, public building showed more. The Tennessee War Memorial, at Nashville, Tenn., by Edward Dougherty and McKim, Mead and White Associated, is dignified and, stately with Greek

Doric detail. It is a composition of much power, simple, straightforward, expressive of its purpose; it illustrates remarkably how vividly alive the classic tradition in America still remains, dominating the entire field of public building.

The Pasadena Library by Myron Hunt and H. C. Chambers shows the lighter side of this tradition. It is a building that, despite its baroque applied detail, Vignola would have delighted in; it combines charm, dignity, playfulness, welcome. It is simply planned with a lovely courtyard between wings. The Detroit Institute of Arts, by Paul Cret and Zantzinger, Borie and Medary, is classic of a quieter, more formal type, but without being cold. Effective use is made of plain wall surfaces. The interior courts are particularly pleasing, and the lighting arrangements handled with the greatest care. It is not only a lovely building in itself, but also what every museum should be, a satisfactory frame for its contents.

The new Fogg Art Museum, at Harvard University, by Coolidge, Shepley, Bulfinch and Abbott, is also a good museum as a museum. It is in a modified Georgian style, as befits the Harvard campus, and its detail is quiet and interesting. The balance of white stone and red brick is particularly pleasing.

In the educational building field, the year saw the completion of the Graduate School of Business Administration (Baker Foundation) at Harvard University by McKim, Mead and White. The completed buildings fully realized the promise of the competition drawings and form a group of quiet Georgian inspiration that has considerable variety—formality in the larger buildings and informal charm in the smaller.

Churches of the year are scarce; the two most interesting are both in California, and both are in frank concrete construction, of the type initiated last year by Pierpont and Walter S. Davis in the Episcopal Church of St. John at Los Angeles. The Wilshire Boulevard Christian Church, at Los Angeles, by Robert H. Orr, uses pre-cast ornament of Romanesque type to decorate exterior faces of cast concrete; the interior with a lovely painted wooden trussed roof is seriously compromised by the galleries. The First Congregational Church, in Oakland, Calif., by John Galen Howard and Associates, uses a similar technic but the style is simpler, more classic and formal. It has great dignity.

Three competitions for important public buildings deserve mention. The winning design for the Caddo Parish Court House, Shreveport, La., by Edward F. Nield, is a fresh and powerful composition that shows the gradual merging of classic and modernist traditions. It has an interesting wall treatment, and an entrance motive showing strong influences from Goodhue's Nebraska Capitol, with a colonnade above. The winning design for the much larger Milwaukee County Court House, Milwaukee, Wis., by Albert R. Ross of New York, is more severe, more strictly classic. The scale is large and well handled; the front shows colonnades of two different heights magnificently composed and proportioned. The plan is interesting in its arrangement of the court rooms between interior courts.

The competition for the Providence War Memorial, at Providence, R. I. was won by Clark and Arms of New York, with a circular design of quiet dignity and simplicity. The

problem was a difficult one; the scale, especially, being peculiar, due to the site and the surroundings; the winning design well combines grandeur and intimacy.

In Chicago, the greatest architectural achievement of the year was the completion and dedication of the Clarence Buckingham Memorial Fountain, designed by Bennet, Parsons and Frost of Chicago, and Jacques Lambert of Paris, associated. It is one of the largest fountains of its type, with an enormous central basin, two intermediate planes of water, and a large lower pool, decorated with bronze tritons. It is an admirable composition, with the water used as the principal feature of the design, in the best traditions of French garden art.

GREAT BRITAIN. The outstanding architectural event of 1927 was the completion of the great Scottish War Memorial at Edinburgh, by Sir Robert Lorimer, A.R.A. This monument was designed to compose with Stirling Castle; the entire exterior has been studied to give a perfect harmony with its surroundings. Its fresh Gothic-Scottish in general inspiration is large in scale and has in parts a richness and a bigness almost Spanish. Effectively planned, in the shape of a letter B, it has nevertheless, an interior disappointing after the simple grandeur of the exterior. The detail of the great Memorial Hall of the Regiments is modern to be sure, but hard and rather cold; the apsidal chapel, simpler and more effective. Many artists collaborated on this monument, and in general the sculpture is harmonious, though little of great imaginative quality is present. The sculpture is by Phyllis Bone, Mr. and Mrs. Meredith Williams, Douglas Strachan, Alexander Carrick, John R. Sutherland, and the stained glass by Douglas Strachan. The whole has become at once marvelously part of its site, part of the city; but it is nevertheless at times diffuse, and the interior not entirely coherent.

The Memorial Buildings in the War Cemetery at Jerusalem, in Palestine, by Sir John Burnet, R.A., are in the best vein of free modern English design. The Record Room is particularly stunning; the simplicity of its square forms, the deep recessing of the door, and the great scale of the masonry of which it is built unite to give an enormous sense of depth and power.

The New Masonic Temple in Birmingham, by Rupert Savage, is also a War Memorial. It is a simple, rather blocky design, with effective sculptured friezes by Gilbert Bayes. The whole is most satisfactory where it is simplest; the entrance with its columns, less successful than the walls that flank it.

The Charterhouse School has a new War Memorial Chapel by Sir Giles Gilbert Scott, R.A. It is, as one would expect from its designer, an impressive piece of modern Gothic; its interior distinguished by the high lancet windows running well above the spring of the vault.

The largest commercial building of the year was the much discussed Midland Bank, London, by Sir Edwin Lutyens. Its great clifflike wall is impressive, but the design becomes incoherent above the cornice, with the great central dormer and attic treatment. The offices and warehouses for Messrs. Courtauld, in London, by Sylvester Sullivan, use long thin pilasters effectively. The Underground Electric Railway Building, by Adams, Holden and Pearson is designed in receding blocks like some American buildings. It has dignified mass, but occasional trivial detail.

Among smaller buildings, the Cameo Cinema, by Robert Atkinson, deserves mention for its color, its novelty, its simplicity, and the Ford Almshouses, at Rochester, Kent, by E. Guy Dawber, A.R.A., for his skilful use of the most gracious English vernacular.

FRANCE. The reduction in the number of architectural entries at both salons bears witness to the reduction in the amount of construction for the year. The tendency towards an ever increasing modernism continued, with more or less of success. The great competition for the Church of Ste. Jeanne d'Arc, at Paris, was won by Closson, with Chiffot second. The winning design was much criticized; it has neither the traditional harmony of Romanesque or Gothic; nor, on the other hand, the structural simplicity of the best modernism, and its tower and gable are crudely connected. One of the most interesting of the designs submitted was that of A. and G. Perret, a typical Perret design in reinforced concrete, with many resemblances to their church of Ste. Thérèse at Montmagny, using their typical slim uprights and pierced and glazed concrete panels.

The alterations in the Galeries Lafayette by F. Chanaat are an example of the best type of French modernism, rich, delicate, full of feeling for the materials. The treatment of the shop windows is lovely, and worthily continues the tradition of beautiful shop window treatments for which modern Paris is famous.

The Théâtre de la Michodière, by Bluysen, has a plan of amazing cleverness, with a great simple apartment house surrounding the theatre proper. This is placed with its parquet one floor below the street level, allowing interesting stair treatments, and a good light court above the auditorium. The interior of the theatre is simple, rich, and fresh, but to an American eye the use of the horseshoe plan in 1927 seems an anachronism.

The houses of A. Lurcat at Versailles show the cubical influence of Le Corbusier. They show freedom, however, and curved bay windows lessen the feeling of austere rectangularity that is the danger in this type of work.

GERMANY AND AUSTRIA. More building was done in 1927 in Germany than ever before. Here, too, the modernist tendency was supreme. Rectangularity rules; there were even increasing experiments in the use of different materials, and the growing use of daring exterior color to give interest to the square, uncompromising forms. It is a curiously vital type of modernism, vivid even in its frequent crudities.

The Tannenberg War Memorial, at Hohenstein, East Prussia, by Walter and Krüger of Berlin, is an enormous octagonal structure with eight towers, and little relief or ornament. It is impressive by its stark size alone. More gracious is the Hamburg Health Department Building, by Hermann Höger, which like so many modern Hamburg buildings uses charmingly the varying textures and patterns to which the material, brick, lends itself. It is a simple and straightforward piece of design. Three Bavarian post offices—at Kirchenlamitz, by Erhard, at Schafflach, by Holzdammer, and at Mainburg, by Grimm—have more feeling for local tradition; all make interesting use of the Bavarian high-pitched roofs.

The great railway station at Stuttgart, by Paul Bonatz and F. E. Scholer, begun in 1913, delayed by the war, was at last completed. It

is a simply planned composition, with great arched windows, a long colonnade, and a clock tower, of coursed but rough-faced stone, extremely effective in its dignity, its simplicity, its lack of extraneous ornament. The Capitol Cinema, Berlin, by H. Poelzig, is typical of the richness of effect that can be obtained by merely geometric lines, treated in brilliant color. Of the year's industrial building, perhaps the greatest contribution of modern Germany to the world's architecture, Fritz Höger's cigarette factory at Wandsbek near Hamburg is the most interesting. The treatment of the brick buttresses between the windows is particularly novel and lovely. The laboratory building at Dohlem, Berlin, by Luckhardt and Anker, has long narrow windows set in simple concrete walls, great doors, and a good mass.

But it was in the housing field that the greatest quantity of building was done, and it is here that the cubical influence was most dominant. The repetition of continual cubical blocks becomes monotonous, though occasional group compositions of bays and flanking masses show that this type of design is not without possibilities. Particularly around Berlin the growth of suburb after suburb is amazing. And, whatever the quality of the individual house, the group planning is superb. Playground and park spaces abound; there is charm of view everywhere; planting and gardens arise side by side with the thronging houses. This growth furnishes an inspiration for suburban development everywhere; it is the only antidote for the slum. The contrast between this ordered and beautiful growth and the square miles of jerry-built shacks on unpaved morasses serving as streets that surround American cities is all too striking. Some characteristic new developments were those at Magdeburg, by Ruhl and Ganger and Willi Zobel; at Ludenscheid, by Van der Rohe, Stamm, & Oud; at Reinickendorf, by Glass and Gerschel; in Boritz, by Engelmann and Fangmeyer and by Bruno Taut.

A similar trend toward cubism, and towards the building of housing was at work in Austria; although no one project stands out above the rest. Josef Hoffman and his pupils dominate the field.

ITALY. In Italy, Renaissance tradition, particularly in its more baroque types, still exerted a strong influence. This shows alike in the apartment house, Rome, by Antonio Farolfi, with its strange mixture of baroque and high Renaissance details; the Hotel degli Ambasciatori in Rome, by Piacentini and Vogt, with its heavy colossal order and its great cornice, and the Supercinema, Rome, by Foschini and Spaccarelli, with its coffered ceilings, its rich modern-Roman decorations, its incoherence. All show, however, the impingement upon this classic tradition of influences crudely modernistic; and incoherence is almost the necessary result. In the Papal Seminary at Assisi, Giuseppe Momo has wisely built in a style harmonious with the old town. The character is simple and straightforward, but the total effect is cold and bleak.

Quite different is the charming shop at Spezia, by Maullio Costa. Here it is modernism triumphant, but not the crude modernism that hurts the character of the cinema mentioned above or the cubism of Le Corbusier, but the suave and gracious richness of the French ensembles. In its use of materials, its sim-

plicity, its occasional neo-classicism, it is not unlike the work of Sue et Mare. It is a delicate and lovely creation.

THE LEAGUE OF NATIONS COMPETITION. This international competition proved a most disappointing fiasco. It proved only the chaos in which international taste found itself. Not a single one of the published designs revealed adequate grasp of the complicated problem presented, or the enormous possibilities inherent for tremendous and compellingly beautiful synthesis. Doctrinaire designs of all sorts abounded; the expression of theories completely absorbed and defeated any creation of beauty. Confronted with these designs the committee did the only possible thing; distributed prizes so widely that no interested country could feel itself passed over.

ARGENTINA, ār-jen-tā'nā. A South American republic on the eastern coast of the southern part of the continent, consisting of 14 provinces, 10 territories and the federal district. Capital, Buenos Aires.

AREA AND POPULATION. The total area of Argentina is 1,153,119 square miles. An official estimate of the population of the republic as of Dec. 31, 1925, based on the census of 1914, and the birth, death, and migration records since that time, showed a total population of 10,087,118. According to the census of 1914 (the latest official count), Argentina had 7,885,237 inhabitants. The number of immigrants in 1925 was placed at 209,873 and the number of emigrants at 131,668. Normally immigration and emigration balance due to the influx and exodus of large numbers of Italian and Spanish laborers before and after the harvests. The population of the larger cities was as follows: Buenos Aires, June, 1914, 1,575,813, and according to the census of June 1, 1925, 2,310,441; Rosario (Santa Fé), 1914, 222,592 (estimated December, 1923, 265,000); Córdoba, 1914, 134,935 (estimated, December, 1923, 156,000); La Plata, 1914, 90,436 (estimated, December, 1923, 161,000); Tucumán, 1914, 91,216; Santa Fé, 1914, 59,974; Mendoza, 1914, 58,790; Avellanda, 1914, 46,277; and Bahía Blanca, 1914, 44,113.

EDUCATION. Elementary instruction is free, secular, and compulsory for children from six to 14 years of age. According to statistics published by the Statistics and Personnel Bureau of the Argentine Republic early in 1927, there were 855 primary schools of all classes functioning in the Federal Capital, average daily attendance, 237,450; primary schools in the provinces, 8697, average daily attendance, 724,822; primary schools in the territories, 806, average daily attendance, 56,547. Attendance at the 84 normal schools of the country averaged 12,850 students during 1925, and in the practice-teaching schools, 27,312. The average daily attendance in the 44 national preparatory schools of the country was 13,437 students. The University of Buenos Aires and its annexes had an enrollment of 10,433 students; the University of La Plata, 3126; Córdoba, 2551; the University of the Litoral, 3954; and the University of Tucumán, 682.

PRODUCTION. The chief pursuits in Argentina are agriculture and stock raising. About 500,000,000 acres is estimated to be devoted to these two occupations, being about equally divided between the two. Of the cultivable portion about 10,000,000 acres require irrigation. There are more than 200,000,000 acres in federal territories which are suited to stock raising, and these

lands are conditionally offered free, or for sale or on lease. The 1926-27 agricultural year was one of the best ever experienced in the country. All important cereals, including wheat, corn, barley, oats, and linseed were not only exceptionally large, but of good quality as well. Wheat production, amounting to 220,827,000 bushels, was only surpassed by the 1923-24 crop which exceeded it by 26,000,000 bushels, while the corn crop, amounting to 321,000,000 bushels, was only 4,000,000 bushels short of the 1914-15 record crop. Only the oats and flaxseed crops registered declines, but the decrease in neither case was sufficient to offset the increases in other products. Improved conditions in Great Britain and Europe exerted a favorable influence upon two of the most important manufacturing industries of Argentina, meat packing and quebracho extracting. The former industry increased its killings of cattle for export from 1,231,272 head during the first half of 1926 to 1,457,454 head during the corresponding half of 1927, and of sheep packed for export from 2,178,815 to 2,220,265, the figures including solely frigorifico killings. The quebracho extracting industry increased its estimated output from 120,000 metric tons to 150,000 metric tons in the same periods. In May, 1927, the sugar-cane cutters of Tucumán, the largest sugar-producing province of Argentina, went on what proved to be a long drawn-out strike which caused a decrease of about 30 per cent in the final sugar output, but many believed it was perhaps just as well that this decrease should have taken place, in view of the fact that the sugar market of Argentina, owing to previous bumper crops, was overstocked and prices were low.

In an address in the summer of 1927, the Argentine Minister of Agriculture stated that government experts had calculated the value of Argentine industrial production to be 2,889,000,000 paper pesos, and that subtracting the value of raw materials used, estimated at 1,624,000,000 paper pesos, it was evident that the industries had added 1,265,000,000 pesos to the value of Argentine production. This is the first time that figures of this kind have been published.

COMMERCE. The following table on exports for 1926 was prepared by the General Bureau of Statistics for the Ministry of the Treasury:

VALUE OF EXPORTS, IN GOLD PESOS

Group of products	1926	1925
Livestock	847,648,891	886,885,028
Agricultural	410,862,575	444,666,437
Forestral	19,217,520	21,628,639
Other products	14,449,736	15,249,783
Total	792,178,522	867,929,882

As may be noted, though the value is less, the total volume of products exported in 1926 was greater than that of 1925, due to increase in grain exports, as shown below:

QUANTITIES EXPORTED, IN TONS

Group of products	1926	1925
Livestock	1,617,866	1,489,744
Agricultural	10,021,287	7,900,984
Forestral	818,568	881,880
Other products	422,652	475,455
Total	12,274,868	10,248,013

According to the United States Bureau of Foreign and Domestic Commerce, large crops

and a brisk demand on the part of Europe for all Argentine products brought about an exceptionally large export movement in the first half of 1927. Exports almost doubled—from 6,444,327 metric tons during the first half of 1926 to 10,571,485 metric tons during the corresponding half of 1927. Although all products contributed to this increase, the greatest contribution, 3,433,000 metric tons, was made by the wheat and corn shipments. All Argentine products, however, were sold at low export prices, except livestock, hides, dairy products, and quebracho extract, and, consequently, although their export tonnage increased 64 per cent, their value, which amounted to 532,139,891 gold pesos, increased only 25.9 per cent.

In spite of this heavy export movement, imports of foreign merchandise during the first half of 1927, which amounted to 394,247,766 gold pesos, were some 33,000,000 gold pesos less than those of the corresponding period of 1926. Imports from the United States increased 9.4 per cent, while those from Great Britain decreased 4.2 per cent. Two factors were largely responsible for this decrease in imports—the fact that 1926 was a bad year, as a result of which many farmers, ranchmen, and small merchants in the interior went into debt, and the steady appreciation of the peso exchange which made many importers reluctant to buy in the expectation that the peso would go still higher. These deterrents to trade, however, were removed, the former by the good crops in 1927 and the latter as a result of the reopening of the Caja de Conversión on Aug. 27, 1927, and the restoration of the gold standard. Consequently, imports of foreign merchandise may be expected once more to resume their normal development.

FINANCE. In considering the estimates for 1927 the executive proposed that the 1926 budget should apply also to the following year. The Committee of Budget and Finance of the Chamber of Deputies, however, suggested outlays in excess of the estimates for 1926. In the committee's budget the expenditures were calculated at 650,000,000 paper pesos, while the revenues were estimated at 625,000,000 pesos. Despite the certainty of a 25,000,000 pesos deficit, the president, after discussing the matter at length with his cabinet, decided to accept the estimates of the committee, hoping to cover the deficit from increased income from export taxes, in view of the large crop movement expected to occur in the early part of 1927. Congress was inclined to increase these amounts to 681,290,285 pesos (to which should be added the public works budget of 115,548,500 pesos, subsidies amounting to 27,323,875 pesos, and supplementary credits to 42,958,490 pesos, making a grand total of about 867,121,742 pesos, or 115,000,000 pesos more than in 1926). But it was finally determined, after the president had pointed out the dangers of further increasing the government's disbursements, that ordinary expenditures of 650,000,000 pesos should be authorized, and 23,000,000 pesos of additional expenditures should be covered by receipts from the national lottery.

In addition to these "ordinary" expenditures, amounting to 673,000,000 pesos, the budget law also included authorizations to issue 150,000,000 pesos of internal 6 per cent public works bonds and 142,000,000 pesos of 6 per cent bonds for the consolidation of part of the indebtedness of

the State railways. Also, provision was made for the issue of 25,000,000 pesos of 5½ per cent internal bonds to be entitled the Internal Consolidation Loan of 1927, to eliminate the supplementary credits and other unpaid obligations carried over from previous years. In addition to all these, there was still in effect the law for the construction of sanitary works, which contemplated an expenditure of 195,000,000 pesos during 1926 to 1928. In view of the tremendous outlays anticipated it appeared improbable that Argentina could balance its budget during 1927 without resorting to further loans. The total public debt of the country according to the president's message of May, 1927, was 2,239,847,000 paper pesos.

COMMUNICATIONS. The total receipts of all Argentine railways increased from 250,000,000 gold pesos in 1925 to 261,500,000 gold pesos in 1926, and total expenditures rose from 179,300,000 to 184,700,000 gold pesos. Profits increased from 71,200,000 to 76,800,000 gold pesos. Passenger traffic expanded to 145,000,000, or 5,000,000 more than in 1925, and freight increased by 2,000,000 tons to 45,500,000 tons. The total length of all railways at the beginning of 1927 had increased to 38,231 kilometers. The principal branches brought into operation were as follows: From Tintina to Lilo Viejo, 47 kilometers; San Juan to Jachal, 23; on the Central Córdoba Railway, from Arcadia to Gas-tona, 9; on the Southern Railway, from San Jacinto to La Providencia and to Cerro Aguila, 7 and 5 kilometers, respectively; on the Argentine Great Western, the branch from Espejo to Costa Araujo, 55; and the extension of the branch from Villa Atuel, 12.

The State railways had a better year in 1926 than in the previous year, the total receipts amounting to 51,387,000 paper pesos, while expenses were 51,338,000, thus showing a net profit of 49,000 paper pesos. The increase in total receipts amounted to 8 per cent over 1925. There was practically no new construction on the lines of the State railways in 1926, developments being limited to the construction of about 11 kilometers from Embaracación to Yacuibá and to the construction of bridges and other smaller improvements on other small lines.

According to the Pan American Union *Bulletin*, for July, 1927, representatives of the Buenos Aires and Pacific, the Buenos Aires Great Southern, the Buenos Aires Great Western, the Central Argentine, the Córdoba Central, the Compañía General, the Santa Fé, the Central Buenos Aires, the Midland, and the Rosario-Puerto Belgrano Railways met in conference with the President of the Republic in the latter part of March, 1927, to consider plans for the colonization of now unoccupied lands, so that the wealth of the nation may be developed. The Ministers of Agriculture and Public Works, who also spoke at this conference, promised their departmental cooperation. President Alvear expressed his satisfaction at the agreement reached and promised governmental aid for the plan. The State railways were not included in this agreement since they already were under a special colonization law.

The basis of the scheme contains the following points:

The consortium will be organized with the legal status of a commercial company, maintaining direct relations

with the Argentine Government and foreign governments from which immigrants come. Each railway company will superintend the settlement of land on its own lines but shall seek only to cover the cost of the land and other appurtenances with a 10 per cent margin for incidental losses. The capital of the consortium will be subscribed by the railways pro rata according to their mileage. Settlers will be given time to pay for land and services at the rate of 7 per cent interest and 1 per cent amortization. If foreign families have no capital for the purchase of animals, implements, etc., during the first year, the companies will advance funds. The consortium will organize cooperative societies in each colony for the sale of provisions. The consortium is to exist for 10 years from the date of signature of its act of association.

GOVERNMENT. The executive power is vested in a president elected for six years, and the legislative power in a national congress, comprising a senate of 30 members elected for nine years, and a chamber of deputies of 158 members elected for four years by the people at the ratio of one deputy for every 49,000 inhabitants (census of 1914). One-third of the senate retires every three years and one-half the chamber every two years. The cabinet is appointed by and under the direction of the president, and comprises the departments of foreign affairs, finance, interior, justice and public instruction, war, agriculture, marine, and public works. President in 1927, Dr. Marcelo T. de Alvear (assumed office, Oct. 12, 1922); vice-president, Dr. Elpidio González.

HISTORY. The year was comparatively uneventful for Argentina. The Sacco-Vanzetti case (q.v.) caused a tremendous amount of interest and resulted in several strikes of short duration as a means of protest against the actions of the State of Massachusetts. Some labor organization delivered notes to the American representatives in Argentina asking them to protest against the action of Governor Fuller in denying a new trial.

The regular session of Congress opened in May, and, in his address, President Alvear commented upon the prosperous condition of the country along economic and financial lines. He stated that the citizens should be assured of an impartial and fair election for the presidency in the fall. On May 25, the entire country celebrated with due ceremony the 125th anniversary of the beginning of her struggle for independence. On the same day France and Great Britain raised the rank of their legations in Argentina to embassies, a position held only by the Spanish and United States representatives heretofore. The session of congress closed on September 30 without enacting any legislation of sufficient importance to note here.

A slight flurry between the United States and Argentina occurred in the fall over the question of the enforcement of certain provisions of the Fordney-McCumber tariff act. For some time there was a feeling of friction and it had not entirely died down by the time the year closed. It bears a striking similarity to the dispute between France and the United States over tariff difficulties. The American Tariff Commission planned to send an investigation committee to Argentina to study the cost of production of corn and flaxseed in that country in order to adjust the tariff duty in accordance with the flexible provisions of the Fordney act. The Argentine Ambassador to the United States, M. Pueyrredon, strongly intimated that such action would be decidedly unwelcome. No mention of actual prevention of the investigation was made,

but the insinuation was perfectly clear, and, coupled with the strong and active anti-American feeling engendered by the Sacco-Vanzetti case, determined the government to rescind the sailing orders of the investigating committee. The action of the Argentine authorities was quite obviously caused by the widespread dissatisfaction in that country with the manner in which its products were kept out of the United States, not only by the tariff but because of the prevalence of certain diseases among Argentine cattle. During the session of the legislature many measures were proposed to retaliate against the United States, either in the form of a change in Argentine duties or in the form of a subsidy to those exporters who had to pay duties on goods entering the United States. One measure went so far as to propose a separate tariff schedule on American goods, considerably higher than that on all other nations. Nothing came of the proposals, however, and, although no overt act occurred, the relations between the two countries were considerably strained at the end of the year.

ARIZONA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 334,162. The estimated population on July 1, 1927, was 459,000. The capital is Phoenix.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1927	202,000	682,000*	\$9,797,000
	1926	181,000	647,000*	8,399,000
Wheat, winter	1927	58,000	1,450,000	1,958,000
	1926	38,000	950,000	1,235,000
Barley	1927	20,000	700,000	525,000
	1926	25,000	875,000	744,000
Grain sorghums	1927	60,000	1,800,000	1,350,000
	1926	40,000	1,240,000	744,000

* tons.

MINERAL PRODUCTION. Arizona with a total mineral production of \$114,202,670 in 1925, rose to 11th in rank among the States as a mineral producer, and in 1926 slightly improved the total value of its production of the metals gold, silver, copper, lead and zinc, forming the chief part of its mineral output. Of these five metals, the production in 1926 was, in value, \$113,536,288; in 1925, \$113,138,198. Of copper alone, the production was, in 1926, 723,296,051 pounds; in 1925, 713,355,129 pounds, recovered or recoverable metal. Gold production was, in troy ounces, 234,011 in 1926 and in 1925, 201,741; silver production, in 1926, 7,381,027 troy ounces and in 1925, 7,267,068. Lead production was, in 1926, 23,258,274 pounds and in 1925, 23,876,017 pounds. That of zinc was in 1926, 12,946,423 and in 1925, 7,332,116 pounds. Average value of metals produced in 1926 was, save for gold, slightly lower by the unit than in 1925: gold, \$20.672 an ounce; silver, \$0.624 an ounce; copper, \$0.14 a pound; lead, \$0.08 a pound; zinc, \$0.075 a pound. Stone, lime, clay products and other minor items of mineral production brought the total mineral production of the State in 1925 to an estimated value of \$114,202,670.

The value of the gold, silver, copper, lead, and zinc, produced by mines in Arizona in 1927 was estimated by the U. S. Bureau of Mines at \$100,027,100, a decrease from \$113,536,288 in 1926. The decrease was both in quantity and in value,

the latter being due to the drop in the average price of silver, copper, lead and zinc. Copper production was restricted at nearly all the large copper mines during the year, but Arizona still retained its place as the leading copper producer of the United States and was also first in the combined value of the five metals. The gold output decreased to about \$4,185,800 and the silver output was about 613,000 ounces, with a value of \$3,863,000. The copper output in 1927 was about 696,243,000 pounds, with a value of \$90,511,600. Lead decreased to about 19,825,000 pounds, valued at about \$1,342,200. The output of zinc was 1,984,000 pounds with a value of about \$124,600, this large decrease being due to the curtailment of lead-zinc shipments by several large producers.

FINANCE. As reported by the United States Department of Commerce, payments for the maintenance and operation of the general departments of the State in the year ending June 30, 1926, were \$5,471,226; their rate per capita was \$13.06. They included \$1,775,857 for education, apportioned among subdivisions of the State. Interest payments attained a total of \$120,075; permanent improvement outlays, of \$2,229,441. These brought the aggregate of State expenditure to \$7,820,742. Of this, \$2,346,754 was for highways; \$816,861 being for maintenance and \$1,529,893 for construction. Revenue receipts were \$7,683,542; or per capita, \$18.34. Of their total, property and special taxes yielded 65.2 per cent, attaining a per capita rate of \$11.96. Earnings of departments and compensation paid the State for officials' services furnished 4.2 per cent of the revenue; 14.4 per cent was derived from sale of licenses, chiefly on incorporated companies and on motor vehicles, and from a gasoline sale tax. Net direct State indebtedness on June 30, 1926, was nil; there was, however, a contingent debt, formed by the obligations that counties and cities had formed in the days of territorial government. Property that was subject to ad valorem taxation bore a total valuation of \$643,595,819. State taxes levied were \$5,073,507, or \$12.11 per capita.

TRANSPORTATION. The total mileage of railroad line under operation Dec. 31, 1926, was 2496.52. In 1927 the new construction totaled 23.66 miles of second track.

EDUCATION. Through conference with officials of the American Legion the State Board of Education sought to create a joint programme of health education to apply in all schools within the State.

CHARITIES AND CORRECTIONS. Under the control of the Board of Directors of State institutions, consisting of the Governor, the State Treasurer and one appointed citizen member, were the following State charitable and penal institutions: State Hospital for the Insane, with a population in 1927 of about 800; State Prison, 500; State Industrial Schools, 90; Pioneers' Home, 125. The Board had also charge of a State Free Employment Bureau. As reported by the United States Department of Commerce, patients in the mental hospital of the State on Jan. 1, 1927, numbered 684; admittances to State prison in 1926 numbered 256.

LEGISLATION. The regular session of the sixth Arizona Legislature convened January 10, and adjourned April 20, after members had sat several days beyond the time for which the law

allowed payment for their services. An act was passed for the purpose of revoking the portion of the State constitution in virtue of which the State had recognized the authority of the Federal Government over public lands and waters and had relinquished its power to tax these. The act called a special election for May 31, to ratify an amendment of the State constitution to the above effect. The immediate purpose of the proposed amendment was to reassert the right of the State to make its own disposal of the water rights within Arizona territory at the site of the proposed Boulder Dam. A measure providing for highway construction in the ensuing period was passed but was vetoed by Governor Hunt as infringing on the executive privilege. The bill failed of passage over his veto, and the adjournment left the State without any highway programme. A bill to restrict the issue of search warrants in prohibition cases failed of passage in the lower house. By enactment the Legislature required that half of the finds in the excavations conducted at the Casa Grande ruins by the Southwest Museum of Los Angeles should be presented to the State Museum.

POLITICAL AND OTHER EVENTS. Representatives of the State took part during the year in a succession of interstate conferences designed to bring about an agreement on the disposal of the water of the Colorado River. In a meeting in April with legislative committees of California and Nevada, the Arizona legislative committee insisted on the State's claim to one-half of the water rights in the lower river, and on the right to receive revenue on hydro-electric power generated from water of the State and sold outside it. Voters of the State, May 31, confirmed by ballot the alteration of the State constitution, proposed by the Legislature, repealing the cession of rights in the Colorado River to the United States and the exemption of Federal works from taxation. At a conference of the River States held in Denver in September the Arizona delegation maintained its previous attitude in the main, inclining to yield somewhat to claims of Nevada, but opposing those of California. A decision of the State Supreme Court, October 23, removed from the administration of Secretary of State Kerby and placed in the hands of the newly created State Highway Commission the operation of the certificate of title act, which the Secretary had claimed authority to administer. Steps were taken toward the development of a connecting highway between the Old Trails Highway and the Grand Canyon. The general manager of the United Verde Copper Company announced in November that this company had under way plans to ship via Los Angeles harbor, and already had shipped partly by this route. Hostilities between the Mexican government and the Yaqui Indians in adjacent territory in the spring necessitated activity on the part of the Federal border patrol, which intercepted fugitives crossing the frontier. A band of 33 Yaquis entered the State to escape Mexican soldiers, and surrendered near Nogales May 7. Suit was brought in the United States court at Tucson, December 7, against 900 defendants, a previous complaint having been enlarged to include more defendants, on behalf of priority rights of Pima and Apache Indians to use of the water of the Gila River stored in the Coolidge Dam.

OFFICERS. Governor, G. W. P. Hunt; Secre-

tary of State, James H. Kerby; Treasurer, J. C. Callaghan; Auditor, Ana Frohmiller; Attorney-General, John W. Murphy; State Superintendent of Public Instruction, C. O. Case.

JUDICIARY. Supreme Court: Chief Justice, A. G. McAllister; Associate Justices, Henry D. Ross, Alfred C. Lockwood.

ARIZONA, UNIVERSITY OF. A coeducational institution of higher education at Tucson, Arizona; founded in 1885. The 1927 autumn enrollment totaled 1758, and the summer session of 1927 had a registration of 274 students. The number of members on the faculty in the autumn term of 1927 was 161. The University receives Federal and State support. The endowment fund amounted to \$10,000, and the income for the year to \$1,311,851.92. The library contained approximately 65,000 volumes. President, Byron Cummings, A.M., LL.D., Sc.D.

ARKANSAS. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 1,752,204. The estimated population on July 1, 1927, was 1,923,000. The capital is Little Rock.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1927	1,925,000	36,575,000	\$31,820,000
	1926	2,026,000	41,583,000	\$32,226,000
Wheat, winter	1927	28,000	322,000	402,000
	1926	80,000	405,000	518,000
Cotton	1927	3,045,000	980,000*	\$8,980,000
	1926	3,790,000	1,548,000*	\$5,140,000
Rice	1927	175,000	7,438,000	6,694,000
	1926	199,000	10,547,000	10,547,000
Hay	1927	789,000	876,000*	11,709,000
	1926	708,000	800,000*	12,268,000
Oats	1927	207,000	4,140,000	2,401,000
	1926	243,000	5,846,000	2,780,000
Potatoes	1927	29,000	1,972,000	2,958,000
	1926	82,000	1,920,000	3,552,000
Sweet potatoes	1927	38,000	4,408,000	3,526,000
	1926	84,000	3,672,000	3,488,000
Sorghum syrup	1927	44,000	8,520,000*	2,392,000
	1926	88,000	2,926,000*	2,487,000

* bales, † tons, ° gallons.

MINERAL PRODUCTION. Petroleum, in which the State ranked fourth in 1925 in respect of the total value of the product, yielded in 1926 59,229,000 barrels, as against 77,398,000 barrels in 1925, in which year the Smackover field attained its greatest activity. The product of 1926 had a total value of \$69,600,000; that of 1925, \$88,880,000. Coal production showed an increase, being for 1926, 1,459,017 net tons, as against 1,220,039 tons in 1925; in value, \$5,497,000 in 1926 and \$4,829,000 in 1925. Of natural gas, 41,878,000 M cubic feet were produced in 1925, the latest year reported; in 1924, 36,616,000 M cubic feet. The value totals were, for 1925, \$5,324,000; for 1924, \$4,908,000. Gasoline from natural gas was produced in the quantity of 19,686,000 gallons in 1925 and 17,533,000 gallons in 1924; and to the value of \$2,420,000 in 1925 and \$1,784,000 in 1924. Producing the bulk of domestic bauxite, the State increased its total of this product to 371,570 long tons for 1926, from 296,320 tons for 1925; value totals were in 1926, \$2,298,550; in 1925, \$1,878,450. Stone, sand and gravel and clay production continued active. The State attained a total mineral production valued at

\$87,185,532 for 1925 and at \$61,748,999 for 1924.

FINANCE. As reported by the United States Department of Commerce, payments for maintenance and operation of the general departments of the State government in the fiscal year ending June 30, 1926, were \$11,959,106; their rate per capita was \$6.32. They included \$3,962,262 apportioned for education. With the added totals of \$124,367 in interest payments and \$7,243,363 in permanent improvement outlays, the aggregate of State payments attained \$19,326,836. Of this, \$8,967,458 was for highways; \$2,116,840 being for maintenance and \$6,850,618 for construction. Revenue receipts were \$20,190,877; or per capita, \$10.68. Of this total, property and special taxes yielded 35.7 per cent; their per capita rate was \$3.81. Earnings of the departments and compensation paid the State for officials' services supplied 5.5 per cent of revenue; the sale of licenses, chiefly on incorporated companies and on motor vehicles, and a tax on gasoline sales supplied 44.3 per cent. Net State indebtedness on June 30, 1926, was \$3,116,158, or \$1.65 per capita. Property subject to ad valorem taxation had a value of \$604,832,174. State taxes levied were \$5,262,040, or \$2.78 per capita.

TRANSPORTATION. The total mileage of railway line at the end of 1926 was 4888.04. During 1927 two companies built a total of 28.77 miles of track of which 10.07 miles was first track.

EDUCATION. The Legislature passed an equalizing fund bill, which according to State Superintendent J. P. Womack in the *Journal* of the National Education Association provided for payments from State funds to school districts that, having voted an 18 mill school tax, were yet unable to meet minimum standards of efficiency. The Legislature also provided a revolving fund to assist rural schools and school building projects. The school population of the State was estimated in 1926 at 626,730, of whom 470,517 were white and 156,213 were Negro. There were enrolled in the public schools in the scholastic year 1925-1926, 382,172 white pupils, and 114,755 Negroes. Of these 349,601 whites and 112,754 Negroes were in the common schools; in high schools, 32,571 whites and 2181 Negroes. There was expended for current operating expense of the public schools \$10,536,475; for outlays, \$3,429,390; for debt service, \$1,553,599; total, \$15,519,464. Salaries averaged, in high schools, \$1066; in elementary schools, \$610; in the schools as a whole, \$669.

CHARITIES AND CORRECTIONS. The Board of Charities and Corrections, authorized by act of 1925, is the central State welfare organization. It consisted in 1927 of a chairman appointed by the Governor and of two ex-officio members. Under its control were the chief State institutions of welfare. These were the Arkansas Confederate Soldiers' Home, at Sweet Home, near Little Rock; State Tuberculosis Sanatorium, Booneville; State Tuberculosis Sanatorium for Negroes, authorized in 1923 but not yet in operation; State Hospital for Nervous Diseases, Little Rock; State Hospital Dairy Farm, North Little Rock; State General Hospital, authorized but not yet erected; Boys' Industrial School, near Pine Bluff; Girls' Industrial School, Alexander; State Farm for Women, Jacksonville; State Penitentiary, Little Rock, with convict farms at Cummins and Tucker. The Board acted as a parole au-

thority for the penal and reform institutions. The Board also had partial control of the Arkansas School for the Blind, and Arkansas School for the Deaf, both at Little Rock.

LEGISLATION. The Legislature convened in regular biennial session Jan. 10, 1927. It enacted the Crawford-Purkins highway bill, signed by Governor Martineau February 4. This measure had for its purpose the removal of the burden of highway improvement from road districts supported by property taxation. According to Governor Martineau, the law provided means to pay the bonds of the road improvement districts and to construct a complete system of roads. The State was authorized to employ about \$6,500,000 annually out of automobile and gasoline taxes to pay principal and interest on these bonds. It was authorized to issue \$52,000,000 of its own notes at the rate of \$13,000,000 a year for the construction of paved highways and to pledge thereon the proceeds of gasoline, motor oil and automobile taxes. A Note Board was created to effect the sale of the certificates. A measure was enacted creating a State Tax Commission of three members, to be appointed by the Governor for terms of eight years, and relieving the State Railroad Commission of the duty of assessing public utilities for purposes of taxation. There was passed also a State income tax bill taxing incomes in excess of \$1500 for single persons and \$2500 for married ones, with exemptions for \$400 for each child. The tax applied to the year 1926 and thereafter. Its purpose was declared to be the provision of funds for equalization of schooling. (See *Education*, above). An anti-evolution bill failed of passage. The Legislature adjourned March 10.

POLITICAL AND OTHER EVENTS. The floods prevalent in the river lands of the lower Mississippi basin afflicted Arkansas among other States. Inundations from levee breaks began at the end of March. Outside the Texarkana district, where some flooding also occurred, 4,064,480 acres within the State had been inundated, according to information from Federal agricultural experts, published April 25. Floods along the Arkansas River extended across the entire State from Fort Smith to the river mouth. Cotton, sweet potato and rice lands along the White River were overflowed. Several long staple cotton counties along the Mississippi suffered likewise, and the Ouachita and Red Rivers did much damage. Banking aid for the rehabilitation credit needed by farmers and for the means to provide late planting after the waters subsided was organized with Federal support. According to a compilation made by the State Flood Commission in June, Arkansas and Mississippi levee districts had an outstanding indebtedness of some \$50,000,000, which it was hoped that the United States, in adopting a plan of adequate Federal flood control, would take over. An order of the State Industrial Welfare Commission setting a minimum wage of \$1 a day for inexperienced and of \$1.50 a day for experienced women employees was enjoined by a Federal district court, and was declared invalid by the United States Supreme Court, January 17, on the ground that it would deprive the employer of property without due process of law. The State Supreme Court voided on March 14 the land ownership statute of 1925 that forbade ownership of land by aliens who had not filed application for citizenship. A company was

formed to open a large cotton mill at Magnolia, in March.

OFFICERS. Governor, John E. Martineau; Secretary of State, J. B. Higgins; State Treasurer, Ralph Koonce; Auditor, J. C. Cone; Attorney-General, H. W. Applegate; Commissioner of State Lands, Highways and Improvements, Dwight H. Blackwood; Commissioner of Mines, Manufactures and Agriculture, William N. Wilkes; Superintendent of Public Instruction, J. P. Womack.

JUDICIARY. Chief Justice, Jesse C. Hart; Associate Justices, Carroll D. Wood; Frank G. Smith; T. H. Humphreys; William F. Kirby; Thomas M. Mehaffy; E. L. McHaney.

ARKANSAS, UNIVERSITY OF. A coeducational State institution at Fayetteville, Ark.; founded in 1871; comprising colleges of arts and sciences, education, engineering, agriculture (including an experiment station), and schools of law, business administration and medicine, the last named being at Little Rock. In the autumn of 1927 the enrollment was about 1900 and for the summer school of 1927 it was 734. The number of faculty members, including administrative officers, was 190 for the year 1927-28. The number of volumes in the library was approximately 80,000. The productive funds amounted to \$132,000, and the income for the year 1927-28 was approximately \$1,700,000. Two new buildings for the college of engineering and the college of agriculture, costing, with equipment, more than \$700,000 were occupied by the respective colleges at the opening of the autumn term. The new Engineering Hall housed the departments of civil, electrical and mechanical engineering, drawing and architecture, and provided laboratories, drafting rooms and class rooms for those departments, as well as general offices for the college and the engineering experiment station. A graduate school with a dean in charge was established in September, 1927. President, John Clinton Futrell, M.A., LL.D.

ARMAMENTS, LIMITATION OF; CONFERENCE OF 1927. See NAVAL PROGRESS.

ARMENIA. A term applied since April 2, 1921, to the new state known as the Socialist Soviet Republic of Armenia, or the Republic of Erivan. Before the World War, Armenia sometimes indicated the Armenian territories of the former Turkish Empire and sometimes the entire region in which the dominant race element was Armenian. In the former Turkish Empire the Armenians constituted about 38.9 per cent of the population in the following vilayets: Erzerum, Bitlis, Kharput, Diarbekr, Sivas, and Van; being in the minority in the first five and a majority in the last-named. The present number of Armenians in the Turkish Republic is unknown, a large part of the Armenian element having disappeared from Anatolia during the War and afterwards as a result of massacres, deportations, and migrations. The population of the former Turkish Empire known as Armenia and Kurdistan was given at 2,470,900.

SOCIALIST SOVIET REPUBLIC OF ARMENIA. This republic comprises the southeast frontier region of Transcaucasia, which formerly belonged to the Russian Empire, but which in November, 1917, split off from Bolshevik Russia. The whole Transcaucasian region comprised the three main peoples, Armenians, Georgians, and Tartars, and was at first constituted into a federal republic

which lasted only a few weeks, when it was dissolved into three component parts, the Armenian Republic, Georgia, and Azerbaijan, each of which declared its independence. Although the Armenian Republic was recognized by the Allies in 1920, it soon fell under the sway of the Bolsheviks and was proclaimed a Soviet republic on Apr. 2, 1920, and later joined the new Russian federated state. The area is 11,680 square miles and the population in 1926 was 867,671, 85 per cent of which was Armenian. In 1925, 81,000 pupils attended the schools of the republic.

The greater part of the population is engaged in agriculture, wheat, rice, licorice root, tobacco, cotton, and wine being the leading products. The area sown in 1925 was 255,900 dessiatines which represents the pre-war area under cultivation. The cultivation of cotton, which fell away to almost nothing after the Bolshevik Revolution, is gradually assuming its place of importance in the agricultural activities, more than 15,000 dessiatines being devoted to its culture in 1925. The mining of copper is also a leading industry, 1500 persons being engaged in this activity. Having no seaports, the country is almost entirely cut off from the outside world, being compelled to depend for its communications on the single Transcaucasian Railway which passes through its territory from Batum to Baku. The capital is Erivan, with a population of about 90,000.

ARMIES. See MILITARY PROGRESS.

ARMOUR, JONATHAN OGDEN. American meat packer and capitalist, died at London, England, August 16. He was born at Milwaukee, Wis., Nov. 11, 1863, the son of Philip Danforth Armour. He studied at Yale, but did not graduate, returning to Chicago to assist his father, and within a very short time taking a place of prominence in the control of vast packing industries. After his father's death in 1901 he not only directed the business, but extended it so that from an annual volume of \$182,000,000 it increased to more than \$1,000,000,000. Additional plants were built in various parts of the country, to decrease the cost of long hauls by train, and numerous distributing stations were established. Not only in the United States but in Argentina, Mr. Armour extended the business, and at the close of his active management in 1922 there were five Armour plants south of the equator, fifteen in the United States and one in Canada. In 1911 Mr. Armour was indicted with other Chicago packers for alleged violation of the Sherman anti-trust law, and after a trial in a Federal court, with no defense, the jury brought in a verdict of not guilty. In addition to his packing activities, Mr. Armour was a large operator on the Chicago Board of Trade and at times a conspicuous speculator. The Armour interests suffered in the economic depression that followed the World War, and in 1923 Mr. Armour relinquished the presidency of Armour & Company to become chairman of the board of directors, the active control of the packing property passing into the hands of a group of three bankers who held 51 per cent of the stock. Although Mr. Armour to some extent recovered his financial independence, the large firm of Armour & Company ceased after 1925 to be a family affair. Mr. Armour was also active in the Armour Grain Corporation, which had been organized by his father in 1890

and had figured in many of his speculative activities. During the latter part of its career this company achieved considerable notoriety, and in April, 1926, it liquidated and withdrew from the grain trade. Mr. Armour at one time was said to be the largest owner of bank stock in Chicago, but in 1923 he was forced to sell many of his holdings, including those of the Continental and Commercial Bank of Chicago, of which he was a director. In 1921 he resigned as a director of the National City Bank of New York and in the latter part of his life gradually gave up his banking connections. He developed at Lake Forest, Ill., a model farm which was valued at \$5,000,000, but this enterprise, of which he was greatly fond, he was forced to relinquish. He was a director in many railways and other industrial enterprises. He was the author of *The Packers and the People* (1906).

ARRHENIUS, SVANTE. Swedish physical chemist, professor of chemistry at Stockholm University, and Nobel Prize winner for chemistry in 1903, died at Stockholm, October 2. He was born at Wijk, near Upsala, Sweden, Feb. 19, 1859, the son of a land steward, and was educated at the Cathedral School and the University of Upsala, receiving from the latter his degree of Ph.D. in 1884. His early researches in the field of electrical conductivity and its relation to chemical activity were rather lightly esteemed by the professors at Upsala but secured recognition abroad. After a brief period of teaching at Upsala he received a traveling scholarship from the Swedish Academy of Sciences; this enabled him to study abroad, and in 1886-90 he worked in the laboratories of W. Ostwald at Riga and Leipzig, of Kohlrausch at Wurtzburg, of Van't Hoff at Amsterdam, and of Boltzmann at Graz. During these *Wanderjahre* his theory of electrolytic dissociation put forward in 1887 secured for Arrhenius an established position in international science. Refusing an invitation to settle at Giessen Arrhenius returned to Sweden in 1891. He became lecturer and later professor of physics in the newly established Technical High School at Stockholm established in connection with the university. He served as rector of the University from 1897 to 1902. In 1905 he was invited to the University of Berlin, but declined and in the same year he was appointed director of the Nobel Institute at Stockholm, a position he held at the time of his death. In 1902 he was awarded the Davy Medal by the Royal Society of London and in 1914 he delivered the Faraday lecture on the invitation of the Chemical Society, being a foreign member of both of these organizations as well as of the Physical Society and the Royal Institution. He received honorary degrees from the Universities of Oxford, Cambridge, Birmingham and Edinburgh in Great Britain, and from Heidelberg, Groningen, Oslo and Leipzig in Europe. Arrhenius is considered one of the founders of the science of modern physical chemistry due to his theory of electrolytic dissociation derived from his original ideas on the condition of dissolved electrolytes. He had studied the electrical conductivity of a number of substances in dilute aqueous solutions and in 1883 he reached the conclusion that in regard to the conduction of the electric current only part of the electrolyte was to be regarded as "active," this proportion increasing on

dilution, and that there was a parallelism between the "strength" of an acid and its electrical conductivity. This work was extended and elaborated and in 1887 he published in the *Zeitschrift für Physikalische Chemie* his memorable paper, "Über die Dissociation der in Wasser Gelösten Stoffe." This work had the approval of both Van't Hoff and Ostwald and furnished a fertile field for discussion and further experiments. Arrhenius and his colleagues continued their researches at the Nobel Institute and he also worked on quantitative physico-chemical lines on physiological and biological problems. He studied and wrote on serum therapy and the relation of toxins and anti-toxins.

He was deeply interested in cosmogony also, and wrote on such subjects as the nature of planetary atmospheres, the genesis of the solar system, the origin of the aurora, the influence of carbon dioxide on the temperature of the earth, the function of light pressure, and the periodicity of natural phenomena, in a fresh and interesting way as summarized in his excellent popular works. His published works, originally written in Swedish, were translated into other languages, and included such titles as: *Electro-chemistry* (1901); *Immuno-chemistry* (1906); *Theories of Chemistry* (1906); *Worlds in the Making* (1908); *Life of the Universe* (1909); *Quantitative Laws in Biological Chemistry* (1915); *The Destinies of the Stars* (1918); and *Chemistry and Modern Life* (1919).

ARSENIC. In 1927 the United States produced about 10,310 tons of arsenic and imported the following approximate amounts from the countries named: Mexico, 8942 tons; Canada, 1902 tons; Japan, 938 tons; Europe, 371 tons; making a total supply available in the United States during the year of about 22,463 tons.

This may be compared with a production in 1926 of approximately 6221 tons and imports of 7730 tons, and in 1925 of 10,997 tons production and imports of 9316 tons. These figures are of interest when it is stated that in 1911 the United States produced only about 3000 tons and prior to 1901 depended mainly upon England and Germany for its material. In 1927 a large proportion of the arsenic was used for making calcium arsenate, used by cotton planters against the boll weevil, while lead arsenate, paris green, bordeaux, and other mixtures of arsenic for weed killers, cattle dip, and glass figured extensively. It was estimated that in 1927 about 75 per cent of the white arsenic produced in the United States was used for insecticides, 15 per cent by glass manufacturers, and 8 per cent in the manufacture of sodium arsenate. Arsenic for use in wood preservation was being extensively tested in the Forest Products Laboratory at Madison, Wis., and it was believed that arsenical compounds would act advantageously to protect timber not only against decay but against insects of various kinds. (For danger from spraying arsenic, see **HORTICULTURE**.)

ART EXHIBITIONS. The "Art Season" tends each year to become shorter and more and more crowded, and the continuous flow of famous masterpieces from European collections to the United States creates constant and increasing opportunities to view each winter the work of artists of greatest importance from all schools and nationalities, the 'Primitives' to the

latest of the moderns. Indeed, the interest of the serious collector appears to be concentrated on these two schools, to the partial exclusion, for the moment, of those old favorites, the Dutch seventeenth century masters. Examples of eighteenth century English and French masters were also much sought after.

Among the interesting exhibitions of old masters held in various New York galleries were: A superb exhibition of French Primitives, the first ever held in America; an exhibition of Venetian Painting from the fourteenth to the eighteenth centuries, including examples by Tintoretto, Veronese, Tiepolo, and a remarkable "Portrait of a Man" by Bartolommeo Veneto from the Holford Collection; a collection of paintings "From El Greco to Matisse," of most unusual interest, and including a recently discovered Rembrandt painting of "Lucretia," exhibited for the first time; an exhibition of "French Art of the Last Fifty Years"; Degas to Matisse, very fine; a remarkable exhibition of "Flower Paintings" from the middle of the sixteenth century down to 1927; a number of groups of French modern painting, including a beautiful survey of French Impressionism.

A memorial exhibition of the work of Claude Monet was held in the Boston Museum of Fine Arts. Memorial exhibitions of the work of Mary Cassatt and the work of Joseph Pennell were held in the Pennsylvania Museum and in the Library of Congress, Washington; and of Peter Paul Rubens, commemorating the 350th anniversary of his birth, in a New York gallery. Single exhibitions of great interest were: A collection of sculpture by Charles Despiau, seen for the first time in America; Despiau is considered France's foremost sculptor of the day. The first showing of the work of Jacob Epstein in America, a most interesting English sculptor; the work of Ferdinand Hodler, foremost Swiss painter; a retrospective exhibition of the work of Matisse covering 36 years and including his first exhibited painting; a comprehensive showing of the interesting water colors and gouaches of Constantin Guys, a French painter of great individuality active during the Restoration.

The annual exhibitions of summer art colonies and various art societies were held as usual. Among the latter should be especially mentioned the New Society of Artists; the Allied Artists of America; the New York Water Color Exhibition; the Brooklyn Museum Water-Color exhibition; the annual exhibition of American Art at the Detroit Museum; the exhibition of the Société Anonyme; the Multi-National Exhibition of Painting by Living Artists; the first exhibition of Associated Dealers in American Painting; the National Association of Women Painters and Sculptors; and the Salons of America. The eleventh annual exhibition of the Society of Independent Artists was held with a membership of 750 artists, each artist being allowed two works for exhibition. This Society has no jury and no prizes. The Salons of America is also a no-jury exhibition, and two new no-jury exhibitions were held in Boston and in Washington. Others were held in Chicago and in Buffalo. All the exhibits are hung alphabetically in these societies. Of interest were the exhibitions of Danish Painting, Sculpture and Applied Arts held in the Brooklyn Museum, and the fine exhibition of Swedish Decorative Art

in the Metropolitan Museum of Art in New York.

A loan "Exhibition of Religious Art," held in a New York gallery, contained examples of the work of Botticelli, Raphael, Mantegna, Giovanni Bellini, Verrocchio, and other famous masters. The exhibition also contained some priceless tapestries and medieval ivories, all from American private collections.

The Architectural League of New York held one of its most ambitious exhibitions this year in the Grand Central Palace. It was considered the largest and most comprehensive of its kind ever given in the United States, and represented the outstanding achievements in architecture and its kindred arts and trades. More than twenty leading educational institutions in Greater New York exhibited in the educational section, and interesting talks were held for visitors on the origin and development of the various phases of the objects exhibited. Interior decoration and its coordination with the work of the sculptor and the architect formed one of the topics of discussion and the exhibits in this department were of greatest interest. Outstanding exhibits were: Murals by Eugene Savage for the Elks' National Memorial Hall; decorative items for the façade of the new Philadelphia Museum of Art; mural paintings by Arthur Covey for the Norton Memorial Hall, Worcester, Mass.; a series of stained glass windows for the Washington Memorial Chapel at Valley Forge by Nicola d'Ascenzo; and a series of mural decorations by Ernest Peixotto and Thomas Benton, the latter taken from scenes of early American history.

PENNSYLVANIA ACADEMY. The 122nd exhibition of the Pennsylvania Academy of Fine Arts contained 400 oil paintings and over 100 pieces of sculpture and the general ensemble presented a most ingratiating appearance. There is perhaps much truth to the assertion, constantly made by critics and artists, that this exhibition is the most representative and unprejudiced one held of American art each year. The portraits, figure subjects and landscapes were about equal in numbers and the majority were typically American in character. The awards were as follows: Temple Gold medal for the best oil painting by an American painter—Leon Kroll for a large family group, painted out of doors, entitled "My Wife's Family," an ambitiously conceived affair, the types portrayed decidedly un-American, and the landscape of a semi-tropical appearance; Carol H. Beck Gold Medal for the best oil portrait—John C. Johansen for a rendition of Elihu Root, a strong, simple and austere presentation; Walter Lippincott Prize for the best figure composition—Guy Brown Wisner, a delightful "Portrait of an Old Lady"; George D. Widener Memorial Gold Medal for the most meritorious piece of sculpture—Katherine Lane, "Narcisse Noir," a graceful, slender figure. Jennie Sesnan Gold Medal for the best landscape—John R. Grabach, "October," a colorful canvas, with strong compact design and spirited workmanship; Mary Smith Prize for best painting by a Philadelphia woman—Pearl Aiman Vansiever, a typical New Hope landscape, entitled rightly "New Hope"; James McClees Gold Medal for best sculpture group—awarded to J. Lawson Peasey, "Kids"; Edward T. Stotesbury Prize for the painting considered the most important contribution to

the success of the exhibition, which seems quite a responsibility, and must be a painting never exhibited publicly before—Leslie P. Thompson, "Red and Silver," a young woman reclining, the handling gracious and pleasing. Other exhibitors included such artists of varying tendencies as: Fred Wagner, "The Manikin"; George Biddle, "The Betrothed"; Charles Burchfield, a characteristic landscape with houses; Edmund Tarbell, a New England landscape; Sidney Dickinson, Wayman Adams, Irving Wiles, Leopold Seyffert; Wilford Conrow, with portraits; George Luks and Guy Pene du Bois, figure subjects.

NATIONAL ACADEMY, SPRING. The 102nd annual exhibition of the National Academy presented an innovation which caused a considerable flutter in the staid rooms of the Fine Arts Building in New York. The large central gallery was occupied by an invited show of paintings of a distinctly radical tendency. Unfortunately it cannot be said that the display represented the best of so-called modern art in the United States. Nevertheless the contrast between the works of the academic brotherhood and those in the central room was sufficiently startling, and the commingling of the representatives of the two groups presented a spectacle of unusual interest. It did not seem probable that this experiment would be repeated. The modernistic painters represented included Pascin, Karfiol, Maurice Sterne, Guy Pene du Bois, Charles Burchfield, Charles Sheeler, Thomas Benton, and Boardman Robinson. The Academy show proper presented its usual competent and careful array of landscapes and portraits. Nor were any of the usual exhibitors missing. "Landscape with Figures" by John E. Costigan, A. N. A., perhaps the finest canvas by this talented artist, was awarded the Thomas B. Clarke Prize. The first, second and third Hallgarten Prizes were awarded to Antonio Martino, for "Winter," a pleasing landscape; Douglass Parshall, "The Red Sail," a California seascape; and Jerry Farnsworth, "Joaquin's Boys," an interesting figure composition. The first Altman Prize was awarded to Daniel Garber, N.A., for a typical landscape. "On the Delaware," a warm summer scene; the second Altman Prize went to Lester Stevens for "Rockport in Winter." Miss Helen Turner, N.A., won the Isaac Maynard Prize for a portrait of Brander Matthews, and the Saltus Medal for Merit was won by Edward Redfield with a landscape, "Cherry Valley." The Speyer Memorial Prize for the best animal painting was awarded to Albert Stewart for "Silver King." The sculpture exhibit was small and of negligible quality.

CHICAGO. ANNUAL EXHIBITION BY ARTISTS OF CHICAGO. The annual exhibition for 1927 by artists of Chicago and the vicinity, larger and more representative than ever, was held at the Art Institute from February 3 to March 8. This exhibition of local artists has increased greatly in size and importance in the past years, and public-spirited citizens have donated many prizes to stimulate the ardor of the artists. This year the following prizes were awarded: The Frank G. Logan Medal, with \$500 either for purchase of a painting or piece of sculpture, or as a gift, the work of art to be executed by a resident of Cook County: to Margues E. Reitzel, the Fine Arts Building Purchase Prize donated by the estate of Charles A. Chapin for a painting selected from the exhibition and to be given to the

Chicago Public School Art Society: won by Frederic Tellander, with "Over the Seine to La Cité"; the Mr. and Mrs. Julie F. Brower Prize of \$300 to a resident artist of forty years: Rudolph F. Ingerle with "Sundown on the Holler"; the William Randolph Hearst Prize of \$300 to Frederick Grant for "Thieves' Market"; The Edward Butler Fund of \$200 for a painting to be presented to the public schools of Chicago: Margues E. Reitzel, "The Morning Route"; the Mrs. Julius Rosenwald Purchase Fund of \$200 for a painting for the public schools of Chicago: H. Harrington Betts, "Gloriette"; the Joseph N. Eisendrath Prize of \$200 for a painting by an artist who has exhibited for not more than five years: Carl Wuerner, "From my Studio Window"; the William A. Ormond Prize of \$100: Mary Stafford, a portrait "John Fraser"; Morris Rosenwald Prize of \$300: Joseph A. Fleck, "A Pueblo Flower"; Robert Jenkins Prize for a young artist who has not received a previous award: Ignatz Sahula, "The City of Dreadful Night." Other prize winners were: Walter Krawiec, Frances Bowman, Ethel Spears, William S. Schwartz, Carl Hoerman, John Spaulding, Edward A. Klauck, and E. Martin Jennings. With such a rich harvest of awards there was little surprise that this local society of artists surpasses in numbers and ardor perhaps any other similar group in the country.

NATIONAL ACADEMY, WINTER. This exhibition presented much the usual appearance, with a predominance of figure and portrait subjects. With landscapes in the minority, and resulting absence of brightly colored canvases, a more sombre note seemed to prevail, and this appeared especially so with this winter's academy show. Many of the landscapes themselves were painted in grays and sombre greens with lowering skies, heavy with clouds. No doubt the previous summer of uncertain weather and constant storms and fogs had something to do with this impression.

The first Altman Prize was awarded to Lilian Westcott Hale for a "Portrait of T. S. Hardin" in white riding breeches, high hat, a whip in one hand and a cigarette in the other. A rather stiffly ordered room furnished the background but the conception was carried through with unusual skill and vivacity of technique. "With the Three Children," by John Costigan, an outdoor scene, full of light and color, won the second Altman Prize. A sensitive and delicate portrait by Salvatore Lascari was awarded the Proctor Prize; Jonas Lie received the Carnegie Prize for a colorful canvas of boats and water, birch trees in the foreground and an animated sky. Theodore van Soelen was awarded the J. Francis Murphy Prize for "Adobes, Snow and Sunshine"; and Sergeant Kendall the Isidor Medal for "Cypridia" a pink nude figure of a young girl. The sculpture prizes were as follows: Margaret French Cresson, the Julia A. Shaw Memorial Prize for "Francesca," a portrait of charm and distinction; Leo Lentelli, the Helen Foster Barnett Prize for a sundial; Eleanor Mellon the Elizabeth Watrous gold medal for a portrait head, "Janice," conventionally handled.

CARNEGIE INSTITUTE, PITTSBURGH. The twenty-sixth International Exhibition opened with 400 paintings, 280 from European countries and 120 from the United States. Sixteen nations were

represented, and the exhibition was conceded to be the most stimulating and best arranged of any ever held in Pittsburgh. Great interest and presumably some consternation was shown in the award of the first prize, to Henri Matisse for a characteristic "Still Life." That this award, perhaps the most sought after and highly prized in the art world, should have been given to an artist who is one of the leaders of modern art, seems little short of epoch-making, and required on the part of the jury courage and strength of conviction. The second prize went to Anto Carte, a Belgian, for an interesting if somewhat stylized composition entitled "Motherhood." Andrew Dasburg, well known American painter, was awarded the third prize for a careful still-life composition entitled "Poppies." The winner of the first Honorable Mention was Antonio Donghi, an Italian, a leader of the modern painters in Italy. His painting was a large composition of several figures entitled "Carnival." Bernard Kariol, a New York artist, won second Honorable Mention with a composition of two young girls, partially nude, standing against a background of sky and water. The Prize of the Garden Club of Allegheny County was given to Max Pechstein, a leading German painter, for a still life "Calla Lilies," which showed his mastery of rich and vibrant color.

In this year's exhibition the number of artists from each country was smaller and the number of paintings shown by each artist increased so that a better study could be made of their individual development. The jury of eight artists was as follows: Maurice Greiffenhagen, Great Britain; Professor Karl Hofer, Germany; Maurice Denis, France; Felice Casorati, Italy; Eugene Speicher, Horatio Walker, and Abram Poole, America; presided over by Homer Saint-Gaudens, Director of Fine Arts. Artists represented included: Augustus John, Sir William Orpen, A. J. Munnings, Ethel Walker, Dod Proctor, British; Le Sidaner, Matisse, Orthon Friesz, Henri de Waroquier, Dunoyer de Segonzac, Derain, Picasso, French; Karl Hofer, Anton Faistauer, Otto Dix, German; Felice Casorati, Giuseppe Montanari, the veteran Mancini, Italian; Edvard Munch, Norwegian; Max Svabinsky, Czechoslovakian; Randell Davey, Ross E. Moffatt, Leon Kroll, Rockwell Kent, Maurice Sterne, John Sloan, Richard Lahey, Joseph Golinkin and Robert Henri, American; Zuloaga, the brothers Zubizarre, and A. Solana, Spanish; Boris Grigorieff and Alexandre Jacovleff, Russian. The only artist from Pittsburgh who was admitted was John Kane, a house-painter, who paints pictures in his leisure time. His "Scene from the Scottish Highlands," two children in kilts dancing the Highland Fling with bag-pipe accompaniment, displayed a naïveté somewhat reminiscent of the late Henri Rousseau. This painting was purchased by Mr. Andrew Dasburg, the winner of the third prize.

ART INSTITUTE, CHICAGO. The 40th annual exhibition of American paintings and sculpture opened with some 200 paintings and 50-odd pieces of sculpture. The exhibition as a whole presented an academic appearance, therefore nothing especially thrilling. The paintings were of pleasing subjects, well painted, with a decided preponderance of portraits and figure subjects. The sculpture presented an unusually strong and stimulating aspect. The numerous prizes were

awarded as follows: The Logan gold medal and prize of \$1500: John Costigan, "A Summer Day"; Logan silver medal and Prize of \$1000: James Chapin, "The Old Farm Hand" a realistic portrayal of an old gnarled laborer; Mrs. Keith Spaulding Prize of \$1000 for sculpture: John Storrs, "Portrait of Rosannah Sherman"; the Potter Palmer gold medal and prize of \$1000: Arthur Carles, "Still Life," a crisp and scintillating bit of work; Harris silver medal and prize of \$500: John Carroll, "Three People," a well-rendered group sitting at a café table, with a modern feeling in the skillful handling of color and planes; Harris bronze medal and prize: Samuel Halpert, "Nude"; M. V. Kohnstamm Prize: Carl Wuerner, "Summer Landscape," considered the most meritorious work in the exhibition; Martin B. Cahn Prize to Edward Klauke for "Pink and Black," a portrait of a young woman; the Peabody Prize to Macena Barton: "Sunday Morning," two young girls in old fashioned white dresses and hair in bangs; The W. M. R. French memorial gold medal was awarded to Ross Moffatt for "Cod Fisherman" a strong, well-modeled and characteristic canvas of a New England fisherman. Honorable mention was given to Jacob Smith, Karl Oberteuffer, J. Jeffrey Grant and Gaetano Cecere.

EUROPEAN EXHIBITIONS. The outstanding European exhibition of the year was undoubtedly the large loan exhibition held in Burlington House, London, of Flemish and Belgian art from the fourteenth to the nineteenth centuries. It was four years in preparation, and was made possible by the coöperation of the Belgian, French, and British governments, and by private owners in Europe and America, who generously loaned their treasures. This exhibition was considered one of the most remarkable ever held in Great Britain. Another exhibition of great interest, also held in London, was that of the famous W. A. Coats Collection of seventeenth century Dutch, eighteenth century English and modern French paintings, including a remarkable religious painting by Vermeer van Delft. Other exhibitions in Great Britain included: The centenary celebration of William Blake; a comprehensive group of French moderns held in Glasgow; and two fine exhibitions of the works of Rodin and van Gogh, in London. In Paris and in Vienna were held important displays of the work of British Artists, including examples from the eighteenth century. Official exhibitions in Paris were: The "Salon d'Automne" with an immense array; "Salon des Tuileries," the fifth annual exhibition, with no jury and by invitation only, the most important display of modern painting held in France to-day; the academic "Salon des Artistes," and the really mediocre "Société Nationale des Beaux Arts." The Royal Academy show in London presented the same appearance as in previous years, with many large, official portraits by well-known artists.

ART MUSEUMS. During the year 1927 museums all over the United States showed an unprecedented activity, adding to their collections a long list of splendid works of art. The Metropolitan Museum of Art in New York an-

nounced by purchase the acquisition of a "Madonna and Child" by Antonello da Messina, a work of highest importance; "Portrait of Alfonso d'Este," by Titian, an impressive portrait of rare beauty; "Three Graces," by John Singer Sargent, a very large portrait group of the famous Wyndham sisters; a bronze head of "Beethoven" by Bourdelle, the French sculptor; "Assumption of the Virgin" by Ambrogio Borgognone; a rare fourteenth century English chasuble, the only one of its type in America, an unusually important addition to the Museum collection of textiles and fabrics. Also eight fine Gothic tapestries, which were purchased from the monastery of Krems in lower Austria; a rare wood-cut, "Pharaoh's Crossing of the Red Sea" by Titian and dalle Greche; two American paintings by Leopold Seyffert and Frank Benson and a sculpture by Harriet Frishmuth. The suit over the Theodore M. Davis Collection of Egyptian Antiquities was settled in favor of the Museum, which will retain in its possession this valuable addition to the Egyptian department. A fund to be known as the Eliasha Whittlesey Fund, for the purchase of rare objects of art, was a bequest of Mr. Whittlesey.

The Boston Museum of Art collections were enriched as follows: A bequest of paintings from Mrs. Elizabeth Howard Bartol, including a Rubens and a Corot; the Swann Collection, with a Gilbert Stuart and a John La Farge; 24 paintings to be known as the Juliana Cheney Edwards Collection, including examples by Gainsborough, Reynolds and Sargent; a marble replica of "The Awakening" by Maurice Sterne, the gift of Mrs. Galen Stone; a seventh century stone Indian "Durga," the gift of Denman Ross; "St. Martin of Tours" by El Greco, a gift; "The Marriage of St. Catherine" by Lorenzo Lotto, and a life-size Sumerian Diopite head, both purchases.

The Minneapolis Museum opened a new wing, and acquired by gift a select collection of Chinese snuff bottles. The purchases and gifts for the Brooklyn Museum during the year were: Paintings by Jan Bosboom, Robert Reid, Henry Bacon, Allen Duggett, Henry Roseland; two early American portraits by John Smybert; "Portrait of a Lady" by John Neagle; paintings by Mancini and Forain; and a fine sacristy doorway to be added to the new galleries for Italian Renaissance works of art. Detroit celebrated the opening of a beautiful new museum building with a very fine loan collection. The acquisitions for the year included: "The Man with a Flute," by Titian; "Visitation of St. Elizabeth" by Rembrandt, a beautiful example; a lovely "Annunciation" by Gerard David; "The Todd Family" by Gilbert Stuart, a gift; a fifteenth century Gothic Chapel, which was incorporated in the new building; a portrait by John Singer Sargent and a landscape by Arthur Davies.

The Denver Art Museum purchased a life-size bronze statue by Maillol and a portrait head by Rubens; and the Toledo Museum acquired a series of etchings by Rembrandt, Ostade, Meryon, and a painting by Ferdinand Bol. A fine portrait of a "Tahitian woman with children," was acquired by gift by the Chicago Art Institute. The Worcester Museum purchased a medieval stone chapel of the twelfth century from Central France and a beautiful Lorenzo Veneziano polyptych; the San Diego Art Mu-

seum reported the enrichment of their collections by a seventeenth century Gobelin tapestry; a painting by Coello; a select collection of jade; and prints by Rockwell Kent and Charles Sheehan. A huge mural decoration covering the entire wall of a Chinese monastery was installed in the University of Pennsylvania Museum. The new Philadelphia Museum of Art acquired 10 antique period rooms, early American and English, and a gift of \$350,000 from the Department of Education for a panorama of the history of art, but contingent that \$650,000 more be raised by public subscription.

A portrait head by Odilon Redon; "Madonna and Child" by Tintoretto; a rare medieval portable ivory altar; a beautiful Praxitellean bronze Apollo statuette, a terra cotta statuette of a Greek goddess and a French primitive "Portrait of St. Louis," were added by purchase and gift to the collections of the Cleveland Museum. Acquisitions to the Albright Art Gallery of Buffalo were announced as follows: "The Mockery of Christ," Lucas Cranach; "St. Jerome" by Patinir; a diptych by Barend van Orley; "Mlle. Pogany," a marble head by Brancusi; landscapes by Cézanne and Matisse; and portraits by Courbet and Edwin Dickinson. Also a stone Indian Brahma and an Egyptian statue of the sixteenth dynasty.

A gift of \$1,000,000, and the home and art collection of Mr. and Mrs. Charles P. Taft, valued at \$3,000,000, was made by them to the Cincinnati Institute of Fine Arts, contingent on the raising of an additional endowment of \$2,500,000 by the directors of the Institute. The Taft Collection is well-known, and contains masterpieces by Rembrandt, Gainsborough, Jan Steen, Van Dyck and others, besides fine specimens of Limoges ware and faience. The Institute also received a bequest of the Edgecliffe Art Collection from the estate of the late Mrs. Emery. The Carnegie Institute, Pittsburgh, received a collection of rare objects of art, including miniatures, 300 in all, illuminated manuscripts and ivory carvings, the gift of Mr. and Mrs. Herbert du Puy. In June the new Fogg Art Museum, Harvard University, was opened with a beautiful loan exhibition of paintings, tapestries and illuminated manuscripts, the latter from the Morgan Collection, New York City.

A "Portrait of a Nobleman" by El Greco; "Virgin and Child" by Spinello Aretino; and "Virgin and Child" by Bartolommeo Vivarini formed the additions of the year to the collections of the City Art Museum of St. Louis.

EUROPEAN MUSEUMS. A new Museum was opened in Madrid to be devoted to the history and development of that city and the Prado Museum was enriched by five paintings, including an El Greco; the Cerralbo Museum of Spanish paintings and antiquities was bequeathed to the city by the late Marquis de Cerralbo. The Barcelona Museum was enriched with purchases and gifts, and in Romanesque painting and sculpture its collections are now the finest in the world. The National Gallery, London, acquired: "The Trinity" by Titian; a Monet landscape; "Christ taking leave of his Mother," by Correggio, from the Benson Collection, a gift of Sir Joseph Duveen. A "Portrait of Pietro Loredano," by Tintoretto, was purchased by the Melbourne Gallery, Australia; the Dresden National Gallery purchased a large Tiepolo, "Triumph of Amphitrite"; the Royal Art Gallery

"PINKIE"

Sir Thomas Lawrence

In the Collection of Henry E Huntington

TWO PAINTINGS OF INTEREST BROUGHT TO THE UNITED STATES IN 1927

of the Hague acquired a fine Ferdinand Bol, "Portrait of a Young Man." The famous religious painting by Vermeer van Delft, "Christ in the House of Martha and Mary," from the Coats Collection, was given to the Scottish National Gallery.

ART SALES. One of the most important picture sales in America in recent years was the 37 paintings forming the collection of the late James Stillman and the late C. C. Stillman. Although the group was small, many of the paintings were famous masterpieces and the total sum realized, \$716,950, was an American record for a single session. The collection contained examples by Corot, Ingres, Theodore Rousseau, John Crome, Daumier, Murillo, Moroni, Giovanni Bellini, Francia, Pontormo, Tiepolo, and two fine Rembrandts, "The Evangelist," and "Titus in an Armchair." The latter painting was bid in by Sir Joseph Duveen for \$270,000, a price which broke a record, which has stood since the Yerkes Sale in 1910, for a single picture. The striking "Halberdier" by Pontormo brought \$39,000 in this sale. In 1907 Mr. Stillman paid \$10,000 for this painting. The sale of the collection of Dr. John E. Stilwell aroused considerable interest. Paintings of old masters, wood carvings, especially medieval German, bronzes, marbles and furniture were disposed of.

Still another collection of great interest, in view of the big prices obtained, was that of the late Desmond FitzGerald, consisting of American and French modern water colors, etchings and paintings. "The Portage," by Winslow Homer, brought the hitherto unheard-of price of \$16,700, for a water color. Mr. FitzGerald was said to have paid \$250 for this piece.

The etchings and water colors of Frank W. Benson brought unexpectedly high prices, one water color, "Poling the Rapids," realizing \$2,700. The remainder of the famous Quinn Collection of modern art was dispersed at auction.

Other auctions of interest were: The J. Francis Murphy sale and the George Inness sale; the Alphonse Kann Collection of Egyptian, Greek and Roman antiquities; the de Souhami collection of Gothic art; the Grassi, Tolentino, Cattadori Chiesa and Volpi collections of Italian art; the Ruiz and de las Almenas collections of Spanish art; the Benguiat sale of rare Persian rugs, one of which, a marvelous royal Persian animal rug, bringing a price of \$100,000, established a world record for any rug sold at auction; and the De Kermaingant Gothic Collection, including fine Gothic tapestries.

Single sales of great interest were: a remarkably fine "Portrait of the Comtesse d'Haussonville," by Ingres; two rare Siennese paintings from the Benson Collection, by Duccio and Barna da Siena, all three acquired by the Frick Collection; "Portrait of a Man" by Rembrandt, from the James Ross Collection, acquired by a private collector in Boston; "The Market Cart" by Gainsborough and "Captain Little's Children," by Romney, formerly in the Michelham collection, acquired by a Detroit collector; a portrait by Raphael, acquired by Jacob Epstein of Baltimore; a rare Petrus Christus, "Portrait of a Carthusian Monk," purchased by Jules Bache of New York; "Portrait of a Genoese Nobleman" by Anthony van Dyck, a striking full-length figure; from the Huldshinsky Collection of Berlin; acquired by a prominent New York collector; a full-length group,

"Madonna and Child," by Nino de Pisano was obtained by Mrs. Edsel Ford of Detroit; and "Pinkie" by Sir Thomas Lawrence formed an important addition to the already famous collection of the late Henry E. Huntington in California. John T. Spaulding acquired a portrait by Goya, "Don Manuel Garcia."

In London a number of unusually important collections were dispersed at auction. These included: the late Sir George Lindsay Holford Collection of Italian paintings, furniture and majolica, with examples by Botticelli, Pesellino, Lotto, Leonardo da Vinci and Bartolommeo Veneto; the Pallavicini sale of Italian and Spanish paintings; the collection of the late James Ross of Montreal, old English masters and seventeenth century Dutch paintings; the Yorke Collection of seventeenth and eighteenth century paintings; Sir James Murray's collection of modern paintings with outstanding examples by Degas, Daumier, van Gogh, Sargent and others; and the Lawrence Currie Collection, including a famous "Madonna and Child" by Rubens. Of greatest interest was the sale of the famous Benson Collection of 114 Italian paintings, one of the greatest private collections of Italian masters in Europe, en bloc to Sir Joseph Duveen for the reported figure of \$3,000,000. It was understood that the entire collection would be brought to America. All phases of Italian painting are represented by masterpieces of the greatest artists, including Antonello da Messina, Giovanni Bellini, Carlo Crivelli, Giorgione, Titian, Lotto, Veronese, Andrea del Sarto, Luca Signorelli, Bernardino Luini and Cosimo Tura. One of the gems of the collection was a large canvas by Piero di Cosimo, a landscape with figures, of classic beauty.

Other important European sales were: In Paris: Mme. de Polés Collection of fine French and English eighteenth century furniture, paintings, art objects, and tapestries, which broke all French auction records with the high prices obtained; the Eugene Bureau Collection of paintings, dispersed in Amsterdam; Dutch and Flemish paintings belonging to the late Baron Janssen, sold in Brussels; the collection of Dr. James Simon of Berlin, of Dutch paintings, also ivories, tapestries, sculptures, and the Abraham Preyer Collection of old Dutch masters, both sold in Amsterdam. A newly-discovered Vermeer van Delft, a profile portrait of a young girl, was sold to a New York and Paris dealer, and an American collector acquired a beautiful figure subject by the same master, "The Lace-maker" from a private collection in Europe.

ARTSYBASHEV, MIKHAIL PETROVITCH.

Russian novelist, died at Warsaw, March 4. He was born in South Russia, Oct. 18, 1878, and while Tartar in name and origin was of mixed descent, writing of himself, "In my veins runs Russian, French, Georgian and Polish blood." The famous Kosciusko was his maternal great-grandfather. He was left a sickly orphan and struggled for an education, first directing his attention to painting, but being without means to prosecute such studies turned to writing. When a story of his was printed, he determined to become an author. He wrote a number of short stories which were published, and at the age of 25 produced his first novel, *Sanin*. He found difficulty in obtaining a publisher for this, and the book did not appear until 1907. Its success was phenomenal, and it was one of

the most notable books published in Russia in a decade. In 1912 Artsybashev served a two months' sentence in a Russian prison for his revolutionary ideas and his frank realism, but this in no way affected his popularity, and he continued writing in the same realistic vein. His second novel, *U Poslednei Chertii*, was an attempt to depict Russian provincial society after the abortive revolution of 1905. This novel, as well as *Sanin*, was translated into English in 1915. The novel, *Voyna*, was translated into English, with the title, *War*, in 1918, and other works of Artsybashev brought before the English reading public were *The Savage* and the plays, *Jealousy*, *Enemies* and *The Law of the Savage* (1923). Artsybashev was considered among the best of contemporary Russian writers, being of the same school as Gorki and Andréef, and his method and style have been compared with those of Maupassant. His novel, *Sanin*, marked a revolt against the pessimism of Turgeniev, the Christian non-resistance of Tolstoy, and the current type of Russian philosophy. He wrote with frankness, and seemed to be sympathetic with all of his characters, which he handled with literary skill. He produced little after 1914, but his work was translated into German, Yiddish and English, and his reputation spread in the Anglo-Saxon countries.

ASBESTOS. The Dominion of Canada is the leading source of unmanufactured asbestos and the amount shipped in 1926 was stated at 278,689 tons, valued at \$10,095,487. In 1927 it was estimated that the output of Canadian asbestos would be about the same as in 1926 but the value would be higher. There were twelve Canadian mines in operation; six in the Thetford district; one at Black Lake; one at Coleraine, two at East Broughton; and the largest single operation at Asbestos, near Danville. Outside of Canada, South Africa was the next largest producer. The output of Rhodesia in 1925 was 34,349 long tons and in 1927 it was estimated at about 38,000. The Union of South Africa in 1925 produced 9078 tons and its output in 1927 was estimated at about 15,000. Cyprus in 1927 had increased its production to about 10,000 tons, while the Russian mines which were important producers before the War were estimated to turn out 10,000 tons also. In 1926 the United States' production was 1358 short tons, valued at \$134,731, while in 1927 its production was about 1500 tons. Italy, which in 1925 had produced 2490 tons, was estimated to have about the same output in 1927.

ASHANTI. See GOLD COAST.

ASHLEY, SIR WILLIAM (JAMES). British economist and author, professor of economic history at Harvard University, 1892-1901, died at London, July 23. He was born in London, Feb. 25, 1860, and was educated at St. Olave's School, Southwark, and at Oxford University, being history scholar of Balliol College and attaining various honors and prizes during his residence at Oxford. From 1885 to 1888 he was fellow and lecturer at Lincoln College, Oxford, and in the latter year became professor of political economy at Toronto University. In 1892 he was appointed professor of economic history at Harvard University; his chair was said to be the first of its kind. He served until 1901, when he became professor of commerce at Birmingham University, becoming emeritus professor in 1925, and also serving as vice

principal of that institution, 1918-25. He was a member of many economic and other learned societies, serving as vice president of the Royal Economic Society and as president of the economic section of the British Association for the Advancement of Science in 1907 and 1924. He was president of the economic-historical section of the International Historical Congress in 1913, and was Ball lecturer at Oxford in 1922. He was a corresponding member of the Massachusetts Historical Society and the Association of the Royal Academy of Belgium. Between 1899 and 1920 he was examiner in history, economics or commerce in various Universities, Cambridge, London, Durham, in Wales and in Ireland. He was a member of the committee on coal prices in 1915, of the Huth-Jackson committee in 1916, of the food prices committee in 1917, of the consumers' council and cost of living committee in 1918, of the Royal Commission on Agriculture in 1919, of the glassware committee in 1921, of the Agricultural Tribunal in 1923, and of the tariff advisory committee in the same year, and of the committee on industry and trade in 1924. He had been knighted in 1917. He wrote extensively on economics, and was editor of the *Economic Classics* series, for which he translated Schmoller's *Mercantile System* in 1896 and Turgot's *Reflections* in 1898. He wrote an introduction to *English Economic History and Theory* (part i, 1888; part ii, 1893) (a work translated into German, French and Japanese). He also wrote: *Surveys, Historic and Economic* (1900); *Adjustment of Wages* (1903); *The Tariff Problem* (1903) (fourth edition, enlarged, 1920); *Progress of the German Working Classes* (1904) (translated into German); *The Rise in Prices* (1912) (translated into German and Swedish); *Gold and Prices* (1912); *Economic Organisation of England* (1914) (translated into French); and *The Christian Outlook* (1925). His editorial work included the preparation of *British Industries* (1903); *British Dominions* (1911); and *Mill's Political Economy* (1909). He was the joint author of the *Report of Unionist Social Reform Committee on Industrial Unrest* (1914).

ASIR. See ARABIA.

ASPHALT. In 1926 the United States produced 715,180 short tons of native asphalt and related bitumens, valued at \$4,484,960, and manufactured asphalt aggregating 3,458,470 short tons, with a total value of \$46,551,400. Of this last amount, 1,245,160 tons, valued at \$15,452,940, was produced from domestic petroleum and 2,213,310 tons, valued at \$31,098,460, from foreign petroleum. Imports of native asphalt and bituminous rock into the United States during 1926 amounted to 142,632 short tons, an increase over 1925 of 17 per cent. This came from Trinidad and Tobago, which shipped 76,562 tons and from Venezuela, which shipped 46,292 tons, as a result of development work at the Bermudez Lake deposits.

ASTHMA. In the article entitled ALLERGIC DISEASES (which see) is an account of the allergic chamber in which it is possible to free the air of those specifically irritating particles which provoke the paroxysms of asthma during sleep. The Dutch authors mentioned installed

these sleeping cabinets in 47 private houses and here and in certain hospitals over 500 asthmatics were treated with brilliant results, all evidences of the paroxysms disappearing in two or three days. The effects were the same as if the patients had sought a climate of high altitude, high mountain air having been practically brought to the low altitude city with its contaminated air.

A study of more than 40 asthmatics by Dr. Eskil Kylin, a Swedish practitioner (*Klinische Wochenschrift*, Sept. 10, 1927) appears to show that the susceptibility to allergens depends on some peculiarity of metabolism. Compared with the average man, asthmatics' blood contains a deficit of calcium and an excess of potassium. The paroxysms of the disease are preceded by an increase of blood chlorine and followed by a diminution of the same. The urine contains an excess of calcium. The blood pressure reaction after the injection of adrenalin is of the vagotonic type and there is evidence that the mechanism which regulates the blood pressure, presumably as a result of the disturbed calcium-potassium equilibrium, is insufficient for the demands upon it.

ASTRONOMY. The internal distribution of temperature, pressure, and density in a star under the influence of its own gravitational attraction may be found by solving the mathematical equations which express the necessary conditions of mechanical and radiative equilibrium. In formulating and solving these equations, however, Jeans and Eddington have made use of different assumptions; and on the basis of their respective theories, together with differing hypotheses as to the generation of stellar energy, several alternative conceptions of the course of stellar evolution have recently been suggested.

It is now generally agreed that the transformation of matter into energy is the source of stellar radiation. According to Jeans, the rate of transmutation must be independent of temperature and pressure (else the stars would be unstable), but is different for different kinds of matter; the heaviest chemical elements have the greatest capacity for generating energy, and probably most of the stellar radiation comes from elements of atomic weights far higher than those of any substances found on the earth. The most active elements become used up first; hence the average atomic weight of the material, and the amount of energy radiated per unit mass, continually decrease during the life of a star. The most recent investigations of Jeans have led him to the conclusion that under the above circumstances a purely gaseous star would be dynamically unstable; and such extensive departures from the gas laws are required to produce stability, that the condition of a large part of the mass of a star (though not necessarily a large part of its volume) is better described as liquid than gaseous. The prevalence of binaries, which have almost certainly been formed by fission, supports this view, since Jeans has shown that fission cannot take place unless the internal state approximates to incompressibility. In a liquid star, radiation pressure ceases to be important.

Jeans suggests that a star is first born out of a nebula, with a density so low that it is in the gaseous state throughout and hence unstable. The star will either contract rapidly

until substantial deviations from the gas laws occur in the interior, or, if its mass be large, it will pulsate with a period of a few hundred days and begin life as a long-period variable. Once the star has become stable, its further evolution is determined by the rate of transformation of matter into energy. As the star loses mass and radiating power (through the annihilation of active elements, and the radiation of the resulting energy) it slowly contracts, and the internal temperature and density increase. The rise in temperature causes the atoms to become more and more highly ionized; now, in an atom the external electrons are distributed around the nucleus in successive "shells" or "rings," and at different stages of ionization the atoms are of very different effective sizes. As the density increases because of the contraction, the atoms become more closely packed together; but as each ring of electrons is in turn finally stripped off by the rising temperature, the packing is relieved through the consequent decrease in size of the atoms. The liquid state is most closely approached just before a ring is lost, while just afterwards there is a short period of instability and rapid contraction during which the star is gaseous.

The evolution of a star consists in a series of drops from one stable configuration to another, together with a slow steady progress through each such configuration, though fission may intervene at any stage; the giants, dwarfs, and white dwarfs represent stable states, separated from each other by unstable configurations. The "main sequence" is composed of stars in which most of the atoms in the interior are ionized down to the so-called K ring, and packed together until they form a liquid; as the star slowly contracts and gets hotter it moves down the main sequence until ionization of the K ring finally begins, when it quickly passes through an unstable condition and becomes a white dwarf.

In the giant stars, the atoms in the interior are ionized down to the L ring; in the white dwarfs, most of them have lost all their external electrons, and, according to Jeans, are therefore immune to annihilation. The little energy which the white dwarfs can generate and radiate comes from their cooler outermost portions; these stars are in an almost stagnant state, and have incredibly high internal temperatures and densities.

STRUCTURE OF THE UNIVERSE. Next to the galactic concentration, the most striking feature of the distribution of stars over the sky is an irregularity, recently studied by Seares, due to an eccentric location of the sun 4000 light years from the centre of the system formed by stars brighter than the 18th magnitude. Since, according to Shapley, the sun is 80,000 light years from the centre of the system formed by the globular clusters, the latter system is not concentric with the stellar system.

According to Kreiken, the sun is also eccentrically located in the local star cloud. This local cluster includes the majority of the brighter stars, and its effect can be traced to stars of the 15th magnitude; it has lately been estimated to be about 20,000 light years in diameter, instead of 3500 as previously estimated from the bright helium stars.

M. S. King has found that, on the average, stars up to about 100 light years distant are

nore reddish the farther away they are, but that beyond there is no increase in redness with distance; this indicates the existence of an absorbing nebulous cloud enveloping the local cluster.

ASTROPHYSICS. An atom or a molecule, in a given state of ionization, is incapable, if left to itself, of permanently containing more than a certain definite amount of internal energy; and if more than the normal amount is in any way acquired—e.g. through absorption of light, or by collision—the excess is ordinarily given out again very quickly in the form of radiation. Thus, comets, in addition to reflecting sunlight, are stimulated to glow as they approach the sun; the bright bands in the spectrum (due to chemical compounds that remain gaseous at very low temperatures) are mostly “resonance bands,” i.e. they arise from the emission of light that has previously been absorbed from sunshine by non-ionized molecules with the normal energy content. In a similar manner, some of the diffuse galactic nebulae reflect the light of nearby stars and show a continuous spectrum, while others are stimulated to self-luminosity by associated stars and show an emission spectrum. Nebular emission spectra are produced only by stars of high temperature, and the hotter the star the stronger the spectrum; the hottest stars of all are those found at the centres of the planetary nebulae. The stellar temperatures necessary to account for the observed luminosity of the nebulae have been calculated by Zanstra from the quantum theory of radiation, and show good agreement with the temperatures deduced in other ways.

Sometimes, upon acquiring an excess of energy, an atom goes into a condition known as “metastable,” in which it remains for a relatively long time before giving out radiation. Under terrestrial conditions, an atom in this state usually gives up the excess energy by colliding with another atom before it has had a chance to radiate at all, but collisions are so infrequent in the excessively tenuous nebulae that the atoms usually return to the normal state from even the metastable condition by emitting radiation; the modern theory of the structure of line spectra indicates what lines would be produced in this process, even though they may never have been observed in the laboratory, and in this way I. S. Bowen has shown that nearly all the stronger lines of “nebularium” are due to metastable atoms of ionized oxygen and nitrogen. The same procedure applied to metastable ionized iron has enabled Merrill to identify a number of prominent lines of hitherto unknown origin in the spectra of certain stars.

I. M. Freeman claims to have identified about two-thirds of the lines of coronium with argon.

Ch'ing-Sung Yü, at the Lick Observatory, has developed a promising new method of determining spectroscopic parallaxes, by means of the continuous absorption spectrum associated with the limit of the Balmer series of hydrogen; the intensity of this spectrum is a measure of the extent to which hydrogen is ionized in the star, and is a function of color temperature and absolute magnitude.

STARS, CLUSTERS, AND NEBULAE. An extensive study, by O. Struve, of the fixed calcium lines in the spectra of the hotter stars, indicates that

cium clouds which are not directly connected with stars and are most abundant near the borders of our local cluster. Hubble, by comparing two photographs taken 15 years apart, has found the Network Nebula in Cygnus to be expanding at the rate of 10 seconds of arc per century. Nova Aquilæ No. 3 now has a nebulous disk sixteen seconds across, due to a uniform expansion of about two seconds per year since the outburst; when combined with early radial velocity measures, this gives a parallax of 0.0028 seconds; the spectrum is approaching the Wolf-Rayet type. According to a recent trigonometric parallax determination by Alden, the Pleiades are 300 light years distant, and 35 light years in diameter; the star density is ten times that in the neighborhood of our sun. Walsink has found that Praesepe and the Hyades are twin clusters, traveling in space parallel to each other with the same speed. The mathematical relation between spectral type and length of period of the Cepheid variables, recently determined by Adams and Joy, has been shown by Russell to be in close agreement with that which theoretically should hold in stars undergoing dynamical pulsations and obeying the observed period-luminosity law; the cluster-type variables, however, seem to be governed by different dynamical laws of uncertain nature. The third nearest star so far as now known, with the lowest absolute magnitude yet observed, has recently been discovered by van Maanen to be Wolf 359. The Cepheid variable TX Ophiuchi has been found to have the unusually high radial velocity of -160 km/sec. The far southern star Beta Doradus, of the fourth magnitude, has just been found to be a Cepheid variable with a fluctuation of one magnitude, that curiously has escaped detection during all the centuries that the sky has been studied. Remmeasurements with the interferometer have shown the diameter of Betelgeuse to be increasing.

SUN. E. A. Milne and others have shown mathematically that in the solar chromosphere the atoms are supported mainly by radiation pressure; and S. R. Pike has found that the loss of support due to the reduction of temperature in a sunspot diminishes the partial pressure of the calcium vapor over the spot sufficiently to account for the high-level inflow over spots observed by Evershed and St. John.

The spectrohelioscope has been improved and developed by Hale, and used most successfully, in the visual study of the details of solar phenomena. In particular, his observations on the flow of hydrogen in the vicinity of spots have confirmed his previous conclusions that the law of gyratory storms in the solar atmosphere is the same as the law of terrestrial cyclonic storms.

An elaborate revision and extension of Rowland's great “Table of Solar Spectrum Wavelengths,” which will be of the utmost value to physics and astronomy alike, was nearing completion at Mount Wilson.

PLANETS AND SATELLITES. From observations of surface markings on Mercury, Antoniadi has concluded that the periods of rotation and revolution are the same. The photography of the planets in monochromatic light is yielding many interesting results; in ultraviolet light, Venus shows a remarkable amount of detail, including

equator, and bright areas near the poles. The radiometric observations of Coblentz and Lamp-land have shown the outer atmospheres of the giant planets to be at a very low temperature; the thick cloud layers, however, would be an effective blanket to outgoing radiation, hence the surfaces may be at much higher temperatures. The strong absorption bands in the spectra are still of unknown origin.

Radiometric observations on the dark side of the moon by Pettit and Nicholson indicate a temperature of 110° Abs. During the lunar eclipse of June 14-15, 1927, the temperature of the illuminated portion dropped from 350° Abs. to 170° Abs. during the passage through the penumbra, and to 150° Abs. during totality. From a comparison of the degree of polarization of moonlight with that of light reflected from various terrestrial substances, F. E. Wright has concluded that the lunar surface is probably composed of pumiceous substances high in silica, of quartz porphyries, powders of transparent substances, and possibly trachytes and granites, but with no basic rocks; this is what we should expect from the low density of the moon.

CELESTIAL MECHANICS. Since tidal friction occurs almost entirely in shallow seas which are liable to silting, the changes in the rotation of the earth and the resulting secular accelerations of the heavenly bodies may be variable; W. de Sitter suggests that this may explain the discordance between the secular accelerations of the sun, Mercury, and Venus (which are determined mainly from modern observations, and are proportional to the mean motions as they should be if due to tidal friction) and that of the moon (which is determined from both ancient and modern observations, and is not proportional to the mean motion).

ASTRONOMICAL PHENOMENA. The total solar eclipse of June 29, witnessed through thin clouds in England, was the second one within a few years to be visible in a densely populated region; it was hidden by clouds in most places. Ten comets appeared during 1927, including the 37th observed return of Encke, and returns of Pons-Winnecke, Grigg-Skjellerup, and Schuamasse. Pons-Winnecke became faintly visible to the naked eye in June; and a new comet discovered by Skjellerup on December 3 reached daylight visibility when close to the sun, but faded thereafter with great rapidity.

ATHENS. See ARCHAEOLOGY.

ATHLETICS, TRACK and FIELD. Lloyd Hahn of the Boston Athletic Association, Sabin Carr of Yale University, John Gibson of Fordham University, Charles Borah of the University of Southern California and Chester Bowman of the Newark Athletic Club, were the outstanding figures during 1927 in American track and field athletics. Hahn confined his efforts to indoor competition where he performed most sensation-ally. He ran the third fastest mile ever turned in on an American indoor course, Madison Square Garden, New York City, his time being $4.12\frac{1}{2}$, or within a fifth of a second of the indoor record. Edwin Wide, the famed Swedish runner, was the competitor who forced Hahn to uncover such amazing speed.

The best time ever made in the world for 1000 yards and 1000 meters also went to the credit of Hahn, but unfortunately the International Amateur Athletic Federation does not recognize indoor marks as world records. Gibson's most noteworthy feat was his defeat of Lord Burghley, the English runner, in the 400-meter hurdle race at the University of Pennsylvania's Relay Carnival. Afterward Gibson competed in the national championships at Lincoln, Neb., where he broke the world's 440-yard hurdle record by topping the timbers in $52\frac{3}{4}$ seconds. Only a sprint during the last few feet of the race enabled him to beat out F. Morgan Taylor, Olympic champion and defending title holder.

Carr's notable achievement was his pole vault of 14 feet at the Intercollegiate meet in Philadelphia which set a new world record. Previously Carr had broken the indoor figure of 13 feet, $9\frac{1}{4}$ inches at Madison Square Garden. Bowman's contribution to the sensations of the year was his equaling of the world record for the 100-yard dash, $9\frac{3}{4}$ seconds, in a race in which he defeated the most consistent sprint performer of the year, Charles Borah. At the Intercollegiate meet Borah captured both the century and fur-long events, covering the 220 yards in $20\frac{3}{4}$ seconds, thus erasing a mark that had stood for 31 years. His time for the 100 yards was $9\frac{3}{4}$ seconds, or a fifth of a second slower than the world record.

It was Bowman, too, who collaborated in the setting of a new world relay record for 440 yards. The Newark Athletic Club team with Bowman as a member covered the distance in 41 seconds. In this connection it should be noted that the Olympic record for 400 meters, which is equal to 437.4 yards, is likewise 41 seconds. On the same day that the Newark relayers performed so mightily they ran a dead heat with the New York Athletic Club 880-yard team in time that was a fifth of a second slower than the world record. A run-off of this dead heat resulted in the New York A. C. team equaling the world record.

Only four champions retained their titles in the national Amateur Athletic Union meet at Lincoln, Neb. They were De Hart Hubbard, Cincinnati (unattached), who set a new national mark for the broad jump with 25 feet, $8\frac{3}{4}$ inches; Harry Hinkel, New York Athletic Club, in the 3-mile walk; Pat McDonald, New York Athletic Club, in the 56-pound weight dis-

tance throw, and Levi Casey, Los Angeles Athletic Club, in the hop, step and jump.

The Amateur Athletic Union title holders, outdoor, for 1927 follow:

100-yard dash, Chester Bowman, Newark A. C.; 220-yard dash, Charles Borah, University of Southern California; 440-yard run, Herman Phillips, Illinois A. C.; 880-yard run, Ray Watson, Illinois A. C.; mile run, Ray Conger, Illinois A. C.; 6-mile run, Willie Ritola, Finnish-American A. C.; 120-yard high hurdles, Charles Werner, Illinois A. C.; 220-yard low hurdles, Robert Maxwell, Los Angeles A. C.; 440-yard hurdles, John Gibson, Bloomfield (N. J.) Lyceum; 3-mile walk, Harry Hinkel, New York A. C.; running high jump, Robert King, Olympic Club, 16-lb hammer throw, Jack Merchant, Olympic Club; javelin throw, Charles Harlow, Hollywood A. C.; running broad jump, DeHart Hubbard, unattached; 16-lb shot put, John Kuck, Kansas City A. C.; pole vault, Lee Barnes, Hollywood A. C.; hop, step and jump, Levi Case, Los Angeles A. C.; 56-lb. weight throw, P. J. McDonald, New York A. C.; discus throw, Eric O. W. Krenz, Olympic Club; Decathlon, Frit "Chief" Elkins, University of Nebraska; Pentathlon, Harry Elppen, Newark A. C.; 10-mile run, Willie Ritola, Finnish-American A. C.; 2-mile steeplechase, Willie Ritola, Finnish-American A. C.; 880-yard relay, New York A. C.; 2-mile relay, Illinois A. C., Chicago, Ill.; 1-mile relay, Illinois A. C., Chicago, Ill.; 440-yard relay, Newark A. C.; 4-mile relay, Los Angeles A. C., Los Angeles, Cal.; team champion, Illinois A. C., Chicago, Ill.; 15-mile run, Jacob Kaysing, unattached, St. Louis, Mo.; marathon, Clarence DeMar, Melrose Post, Melrose, Mass.

The Amateur Athletic Union title holders, indoors, follow:

60-yard run, Karl Wildermuth, Georgetown University; 300-yard run, Lancelot Ross, Yale University; 600-yard run, George Leness, New York A. C.; 1000-yard run, Lloyd Hahn, Boston A. A.; 2-mile run, Willie Goodwin, New York A. C.; 70-yard high hurdles, George Guthrie, Illinois A. C.; 1-mile walk, Willie Plant, Morningside A. C.; running high jump, C. W. Major, St. Bonaventure College; standing broad jump, Harold Osborn, Illinois A. C.; standing high jump, Hans Hedberg, Chicago A. A.; 16-lb. shot put, Herbert Schwarze, unattached, Chicago, Ill.; 1½ medley relay, Illinois A. C., Chicago, Ill.; team champion, New York A. C.; Steeplechase, Ove Anderson, Helsingfors University; pole vault, Sabin W. Carr, Yale University.

The women title holders, outdoors, follow:

50-yard dash, Ella Cartright, Eureka, Cal.; 60-yard hurdles, Helen Fluke, Chicago, Ill.; 100-yard run, Ella Cartright, Eureka, Cal.; 220-yard run, Ellen Brough, Paterson, N. J.; 440-yard relay, Pasadena A. C., Pasadena, Cal.; running high jump, Catherine Maguire, St. Louis, Mo.; running broad jump, Eleanor Egg, Paterson, N. J.; 8-lb. shot put, Lillian Copeland, Pasadena, Cal.; javelin throw, Margaret Jenkins, Eureka, Cal.; discus throw, Lillian Copeland, Pasadena, Cal.; baseball throw, Margaret Jenkins, Eureka, Cal.

The women title holders, indoors, follow:

40-yard dash, Rosa M. Grosse, Toronto L. A. C.; running high jump, Mildred Wiley, Boston Swimming Association; standing broad jump, Katherine Mearls, Boston Swimming Association; 8-lb. shot put, Rena MacDonald, Boston Swimming Association; basketball throw, Eleanor Churchill, Boston Swimming Association; 440-yard relay, Paterson Recreation Club, Paterson, N. J.

The 51st annual championship track and field meet of the Intercollegiate Association of Amateur Athletes of America was held at Franklin Field, Philadelphia, the winner being Stanford University with a total of 36½ points. Penn State College finished second with 27 and Yale third with 23½. The University of Southern California, which had been victorious in both 1925 and 1926, had to be content with fourth honors, scoring 23 points. The individual winners with their colleges were:

100-yard dash, Charles Borah, Southern California; 220-yard dash, Charles Borah; 440-yard run, Fred

Alderman, Michigan State; 880-yard run, Oliver Proudlock, Syracuse; mile run, William Cox, Penn State; 2-mile run, Russell Payne, Pennsylvania; 120-yard high hurdles, Eder Wells, Dartmouth; 220-yard low hurdles, Henry Steinbrenner, Stanford; high jump, Thomas Maynard, Dartmouth; broad jump, Alfred Bates, Penn State; pole vault, Sabin Carr, Yale; hammer throw, Marion Ide, Penn State; Elmer Gerken, California; javelin throw, Orest Hines, Georgetown; discus throw, Clifford Hoffman, Stanford.

The Harvard-Yale versus Oxford-Cambridge meet held in London in July was won by the English collegians by 7 firsts to 5. The winners in the various events were:

100-yard dash, Miller, Harvard; 220-yard dash, Rinkel, Cambridge; 440-yard run, Rinkel, Cambridge; 880-yard run, Brown, Oxford; mile run, White, Oxford; 3-mile run, Smith, Yale; 120-yard high hurdles, Weightman-Smith, Cambridge; 220-yard low hurdles, Lord Burghley, Cambridge; shot put, Pratt, Harvard; high jump, tie for first between Pendlebury and Tweed, both of Cambridge; broad jump, Deacon, Yale; pole vault, Carr, Yale.

In the annual meet between Oxford and Cambridge, the latter scored an overwhelming victory with 9 firsts as against 2. In a dual contest between English and French athletes the former gained the victory.

ATOMIC WEIGHTS. See **CHEMISTRY.**

ATOMS. See **ASTRONOMY; PHYSICS.**

AUSTRALIA, COMMONWEALTH OF. A self-governing dominion of the British Empire, consisting of the six original states (formerly colonies) of New South Wales, Victoria, Queensland, South Australia, Western Australia, and Tasmania, together with the Northern Territory and the Federal Territory, and comprising the island continent of Australia with its dependencies. The present Commonwealth dates from its proclamation in 1901, under the act of union passed in the preceding year. Of the divisions mentioned above, the Northern Territory was transferred by South Australia to the Commonwealth; and the Federal Territory consists of a former portion of New South Wales. At the beginning of 1927 the seat of the government was at Melbourne, but on May 9, 1927, the new capital at Canberra was formally opened by the Duke of York. See below under **HISTORY.**

AREA AND POPULATION. The area of Australia is 2,974,581 square miles and the population according to the census of Apr. 4, 1921, 5,435,734. The population was estimated at 6,139,382 on Mar. 31, 1927. The accompanying table from a report of the Commonwealth Statistician and Actuary gives the area in square miles and the population according to the census of 1921, and also the estimated population by states on Mar. 31, 1927:

States and Territories	Area sq miles	Population	
		April 4, 1921	March 31, 1927
New South Wales ..	309,432	2,100,371	2,360,326
Victoria	87,884	1,531,280	1,721,093
Queensland	670,500	755,972	885,741
South Australia ..	380,070	495,160	589,254
Western Australia ..	975,920	832,732	881,470
Tasmania	26,215	218,780	210,529
Northern Territory ..	523,620	8,867	4,085
Federal Capital Territory	940	2,572	7,884
Total	2,974,581	5,435,734	6,139,382

The above figures do not include the full-blooded aborigines, whose number was estimated at 60,000. The figure for 1927 represents an increase of 122,593 during the year. Australia's net gain in population by immigration during 1926 amounted to 42,220, an increase of 2442 over the average for the past five years. Of the new arrivals, 71 per cent came from Great Britain, an increase of 44 per cent over the previous year's immigration from that source. Rural workers represented 38 per cent of the total number. During the same year there were 133,162 births, 56,962 deaths, and 47,865 marriages. The population of the capital cities with their suburbs on Jan. 1, 1927, was as follows: Sydney, New South Wales, 1,070,510; Melbourne, Victoria, 944,400; Brisbane, Queensland, 274,260; Adelaide, South Australia, 316,865; Perth, Western Australia, 184,223; Hobart, Tasmania, 55,130.

EDUCATION. At the end of 1925 New South Wales had 3216 government schools, classified as follows: High schools, 30; public primary schools, 1963; provisional schools, 547; half-time schools, 86; traveling schools, 1; evening continuation schools, 54; corresponding schools, 1; subsidized schools, 531; industrial and reformatory schools, 3. During the same year there were 336,810 children enrolled, and an average attendance of 269,214, and 10,777 teachers were employed. In the 696 private schools there were 66,486 pupils and 2783 teachers. Victoria had 2503 state schools with 6977 teachers, a total enrollment of 254,144 scholars and an average attendance of 171,382. Secondary education is for the most part under the control of either private persons or proprietary bodies, usually connected with some religious denomination. There were in 1925, 490 registered schools in Victoria, with 2163 teachers, and a net enrollment of 64,265 scholars. Queensland supported 1707 state schools, with 4227 teachers and an average daily attendance of 106,994 pupils. There were also 171 private schools, with 1037 teachers, and an average daily attendance of 21,694 pupils. In South Australia there were 1029 schools, 24 being high schools, 21 higher primary schools, and 14 woodwork centres; the number of children under instruction was 84,284. The private schools numbered 184 with 14,990 pupils. Western Australia had 810 government schools with 51,647 pupils enrolled, and an average daily attendance of 45,357; the private schools numbered 122, with an enrollment of 11,609, and an average daily attendance of 10,539. In Tasmania, nine-tenths of the primary teaching is at state schools and the secondary teaching is about equally divided between the state and private schools. In addition to the above there are various high and technical schools in all the states. The capital of each state is the seat of a university: Sydney (1926), 2611 students and 206 professors, etc.; Melbourne (1925), 2557 students; Brisbane (1925), 457 students and 55 professors, etc.; Adelaide, about 800 students in 1926; Perth, about 200 students; Hobart (1925), 236 students.

PRODUCTION, ETC. According to the U. S. Bureau of Foreign and Domestic Commerce, industrial activity in 1925-26 was considerably greater than in the preceding year, but all other lines of endeavor except bee and poultry farming slumped. More than 400 new factories were

established and 11,000 additional workers employed. Extra capital invested in land, buildings, plants, and machinery amounted to £8,000,000. The output of all factories during the year reached £400,342,393 as compared with £380,843,986 in the preceding year, and the value added in process of manufacturing increased from £147,136,758 to £155,424,393. A favorable feature of the year's industrial activity was an increase of £334 to £338 in the amount added by each employee in the process of manufacture. The following table shows the development of Australian manufacturing during the years 1924-25 and 1925-26:

DEVELOPMENT OF MANUFACTURING IN AUSTRALIA

Item	1924-25	1925-26
Factories number	20,795	21,242
Hands employed do.	439,949	450,920
Wages paid £	81,360,021	86,724,683
Value of fuel used do.	11,718,250	18,088,236
Value of material used do.	221,993,978	231,834,908
Value added in process of manufacture do.	147,136,758	155,424,393
Value of output of factories do.	380,843,986	400,342,393
Value of land and buildings do.	91,241,907	96,535,632
Value of plant and machinery do	109,242,900	112,278,150

Agricultural production fell in value from £107,163,000 to £89,267,000, particularly since droughty conditions caused a decline of 500,000 acres in the area cropped. Permanent employment was provided for 432,134 in the agricultural, pastoral, and dairying industries, and the value of implements and machinery used in these occupations was estimated at £43,000,000. The value of output for the agricultural, pastoral, and dairying industries amounted to £249,755,000, as compared with £270,126,000 in the preceding year. In the factories throughout the Commonwealth 450,920 workers were employed during 1925-26 against 423,134 on farms and ranches, even though 42 per cent of the area of Australia is still Crown Land. The sheep industry had a very prosperous year during 1925-26, owing to sound wool positions. Large gains in numbers of sheep were recorded by all of the States. The total at the opening of 1926 reached 103,563,218, the highest number since 1891, the record year, when 106,421,068 were reported. Wool production in 1925-26 amounted to 830,459,607 pounds, a record yield up to that time. Cattle and horses declined slightly in number, but pigs increased.

The mineral production for the calendar year 1926 declined slightly as compared with the previous year. Gold production reached a very low mark for the year. Coal mining, on the other hand, was active and gave employment to 30,457 persons out of a total of 54,999 in all branches of the mining industry. The value of all mineral production in 1926 was £23,951,000 as compared with £24,592,000 in 1925. Coal was the largest source of wealth, contributing £11,664,000; silver and lead were next, £4,931,000; gold, £2,209,000; and zinc and concentrates, £1,462,000.

The table on the following page shows the value of production and the contribution of individual activities, 1921-22 to 1925.

VALUE OF AUSTRALIAN PRODUCTION

Year	Agri- cultural Thousand £	Pastoral Thousand £	Dairy, poultry, and bee farming Thousand £	Forestry and fisheries Thousand £
1921-22	81,890	74,982	44,417	10,519
1922-23	84,183	97,029	43,542	11,124
1923-24	81,166	110,075	42,112	11,866
1924-25	107,163	126,773	45,190	12,357
1925-26	89,267	113,827	47,161	12,784

Year	Mining Thousand £	Manu- facturing Thousand £	Total Thousand £	Per capita value £ s. d.
1921-22	19,977	112,517	344,302	62 9 11
1922-23	20,316	123,118	379,882	67 6 11
1923-24	22,232	132,732	400,183	69 12 0
1924-25	24,646	137,977	454,106	77 6 3
1925-26	24,692	143,266	430,387	71 16 6

Industrial disputes in Australia in 1926 numbered 360 and involved 113,034 workers, according to a report issued in December, 1927, by the Australian Bureau of Census and Statistics. Working days lost amounted to 1,310,261 and loss of wages to £1,415,813. New South Wales led all other states in the number of these disputes, with 256, involving 96,640 workers, and a loss in wages of £1,229,410. According to the report, the record for 1926 was gratifying as compared with former years, because of the small number of strikes and their comparative brevity. The loss in days, however, was the highest since 1920, indicating that disputes in 1926 involved larger bodies of workers.

COMMERCE. The following tables supplied by the Commonwealth Statistician show the value of direct overseas imports and exports for 1925-26 and 1926-27:

COMMERCE—VALUE OF DIRECT OVERSEA IMPORTS, 1925-26 TO 1926-27

States and Territories	1925-26 £	1926-27 * £
New South Wales	64,009,929	69,013,846
Victoria	50,327,055	55,559,214
Queensland	13,772,854	13,603,887
South Australia	14,079,788	15,456,427
Western Australia	7,896,174	9,447,412
Tasmania	1,518,210	1,786,853
Northern Territory	34,168	27,288
Total	151,638,178	164,744,927

* Preliminary figures.

VALUE OF DIRECT OVERSEA EXPORTS, 1925-26 TO 1926-27 *

States and Territories	1925-26 £	1926-27 * £
New South Wales	54,001,814	62,849,428
Victoria	33,107,576	34,682,813
Queensland	26,384,916	14,721,157
South Australia	19,450,144	17,018,796
Western Australia	12,611,681	18,073,922
Tasmania	2,970,226	2,896,496
Northern Territory	85,902	32,929
Total	148,562,209	144,775,541

* Goods destined for overseas countries are largely transferred from one State to another for transshipment to the overseas country. In this table such goods are shown against the State from which they were finally dispatched.

* Preliminary figures.

Wool represents Australia's greatest liquid asset for the payment of its purchases abroad and of the interest on its heavy burden of debt, the latter largely due to its participation in the World War. Of the total trade in exports for 1925-26 greasy wool alone was credited

with over £56,495,000. Wheat is also an important factor. The rabbit, once classed merely as a destructive pest, has become a commercial asset through the great demand for its skin, the export value rising close to £3,000,000 per annum. The fur enters largely into the felt hat industry in the United States. Butter and other milk products, meats, minerals, coal, pearly shell, essential oils, hardwoods, hides, skins, and leather, fresh and dried and some canned fruits are also important export commodities. Australia has developed its secondary industries to some extent, but the lack of a home market and consequent inability to reduce manufacturing costs by mass production methods have prevented any appreciable export of manufactured articles, other than to New Zealand and the near-by Pacific island groups under British control. High tariff walls were having the effect of encouraging the establishment of branch plants of American and English manufacturers in Australia and there was likely to be a greater movement in this direction. Despite its small population the Commonwealth's purchases abroad amount to more than \$120 per capita, and this in face of a tariff carrying but a limited free list and rising from 5 to 60 per cent. British goods enjoy a tariff preference, and, in the case of public purchases, a further sentimental preference which sometimes rises to 20 per cent, creating a sizable handicap when quoting on public works and supplies.

FINANCE. The revised budget estimates for the fiscal year ended June 30, 1927, as published by the Commonwealth Treasurer, indicated a larger surplus than was originally anticipated. The original estimates were expected to result in a surplus of only £149,381, whereas the revised estimates showed a probable surplus of £2,620,365, an increase of £2,470,984. As the accumulated surplus on hand June 30, 1926, amounted to £285,877, the total accumulated surplus of the Commonwealth Government as of June 30, 1927, probably approximated £3,000,000. The larger surplus anticipated by the Federal Government was accounted for by marked increase in revenues. The original budget estimates placed revenues at £75,131,150 while in the revised figures they totaled £78,162,349, or an increase of £3,031,199. The increase in expenditures as compared with the original estimates amounted to only £562,215. The principal items responsible for the increase in revenues were customs and excise duties, £3,052,769, and income tax, £620,265. On the other hand, miscellaneous revenues, which include such principal items as interest on loans for states and interest loans to states, showed a decrease of over £1,000,000. A comparison of the original estimates with the revised for the fiscal year 1926-27 appears in the accompanying table:

COMPARISON OF ORIGINAL AND REVISED ESTIMATES OF AUSTRALIAN GOVERNMENT FOR 1926-27—REVENUES

Items	Original £	Revised £
Customs and excise duties	40,500,000	43,552,769
Post and telegraph	11,441,000	11,848,744
Income tax	10,506,000	11,126,265
Land tax	2,811,000	2,815,898
Estate duties	1,850,000	1,862,851
Other taxes	850,000	887,808
Railways	499,000	477,732
Other revenues	8,174,150	7,404,787
Total	75,131,150	78,162,349

COMPARISON OF ORIGINAL AND REVISED
ESTIMATES OF AUSTRALIAN GOVERNMENT
FOR 1926-27—EXPENDITURES—Continued

Items	Original £	Revised £
War, repatriation and defense	34,019,906	34,005,339
Special appropriations:		
Interest and sinking fund .	1,152,000	1,185,449
Invalid and old-age pensions	9,000,000	9,149,886
Maternity allowance	675,000	655,080
Other special appropriations	1,186,785	1,288,478
Additions, new works, etc. . .	230,234	182,488
Payments to or for States . . .	12,765,462	12,889,384
Expenses of departments . . .	2,794,141	2,973,316
Miscellaneous services	464,904	685,424
Post and telegraph	11,294,480	11,806,500
Railways	968,868	918,355
Territories	435,539	407,385
Total	74,981,769	75,541,984

As the accompanying table shows, no notable increases were made in any of the items of expenditures. Among the payments to or for the states are included the capitation payments to states in accordance with the surplus revenue act of 1910. This act provided for the retention by the Commonwealth Government of the whole of the customs and excise duties and for the payment to the states of 25s. per head of population.

The public debt, excluding the debt on account of the states, stood at £370,566,484 on Dec. 31, 1926, as compared with £374,859,378 six months earlier. The war debt was reduced during the period by £3,560,439, and the debt for works and services by £732,455, or to a total of £4,292,894. The debt on account of the states on the other hand, increased by £7,364,177. The total debt of the Commonwealth Government, including the debt on account of the states, increased from £458,443,350 to £461,514,633 during the six-month period. A comparative statement of the debt as of June 30 and Dec. 31, 1926, is presented in the following table:

AUSTRALIAN PUBLIC DEBT AS OF JUNE 30
AND DEC. 31, 1926

Item	June 30 £	December 31 £
War debt	804,546,856	800,985,917
Works and other purposes . .	70,818,022	68,580,567
Total Commonwealth . . .	874,859,878	870,566,484
Debt on account of States . .	83,588,972	90,948,149
Grand total	458,443,850	461,514,638

Compared with the position as of Dec. 31, 1926, the Commonwealth war debt as of Dec. 31, 1926, showed a reduction of £8,663,700, but the debt for works and other purposes revealed an increase of £5,673,127.

COMMUNICATIONS. For a country of such limited population, transportation facilities are remarkably extensive. There remains still the unfortunate handicap of differing railway gauges, which increase the cost of interstate freight shipments and add considerably to the inconvenience of travel. Although the uniform standard gauge has been decided upon it will be many years before the handicap disappears. There was in 1927 under construction a connecting link, standard gauge, between Sydney and Brisbane, which would cut the running time probably six hours and would obviate the present necessity of changing trains at the border. The long contemplated north-south railway, through the heart of the continent, at last had been commenced. It will open up a section

undeveloped but reported rich in resources and possibilities. Other lines contemplated include one linking up the loose ends of existing railways running inland from the Queensland coast. Had such a north and south line existed, it would have meant the saving of hundreds of thousands of sheep lost during the past year by reason of drought and lack of facilities for moving them from the affected regions to areas of plentiful water and grass.

An important event in the development of Australia took place late in January, 1927, when the first sod was turned at Oodnadatta for the extension of the railway from its existing terminus to Alice Springs, in approximately the geographic centre of the Commonwealth. This section forms an additional link in the railway route planned to connect Darwin on the north coast with Adelaide on the south coast, and will probably be a considerable factor in the settlement and development of the now practically uninhabited centre of the island continent.

The railway from Port Augusta to Oodnadatta, about 478 miles, had been in use for many years, the final section having been opened in 1891. The new line, to be approximately 291 miles in length, was to be completed by June 30, 1929, at an estimated cost, exclusive of rolling stock, of £1,700,000. Sixty-pound rails, rolled in Australia, and western Australia hardwood ties were to be employed. Contracts were let for rolling stock, engines and cars, all to be manufactured in Australian shops. The line was to be standard gauge, 4 feet 8½ inches, and the agreement between the Commonwealth and South Australia provides for the building of a direct connecting line of the same gauge between Port Augusta and Adelaide.

The railway between Port Augusta and Oodnadatta was given a valuation of £2,400,000. The loss on this line in 1925-26, including interest, was £205,038, and the new extension will for a long time show a considerable annual deficit. The outlay and the inevitable losses were considered justifiable, however, in view of the ultimate benefit of the rail connection between northern and southern Australia and the anticipated growth of population, with its accompanying development of the agricultural, pastoral, and mineral resources of the territory to be served. The Federal Government will control the line, as it does the short line running from Darwin to Katherine in the Northern Territory, something over 198 miles. This, like the present line from Port Augusta to Oodnadatta, is 3 feet 6 inch gauge; but it will probably be altered when the last link is provided, to permit a uniform gauge for the entire distance. The first 25 miles of the line is to be constructed departmentally by the Commonwealth Government, and the remainder of the line to Alice Springs is to be constructed by private contract through public tenders.

The annual report of the commissioners of the Australian State Railways for the year ended June 30, 1926, showed that the capital expenditures totaled £26,267,702, including lines under construction; this represents an increase of £1,923,649 over the previous year. The ordinary working expenses were £3,121,145 and the interest on capital, £1,195,108, the total of £4,316,253 showing a deficit for current operations of £54,079. Accumulated and deferred charges

aggregated £3,982,314, showing a total accumulated deficit of £4,036,393.

The total number of the registered vessels in 1925 was 2234 of 406,363 tons. In the same year 1726 vessels of 5,596,400 tons entered the ports of Australia and 1723 vessels of 5,604,119 tons cleared. In 1925-26 the total tonnage entered was 5,303,805; cleared, 5,364,884. In the first nine months of 1926-27, 3,690,543 tons entered and 4,168,619 cleared.

GOVERNMENT. The executive power is vested in the king, who acts through the governor-general, assisted by an executive council of responsible ministers, who must be members of the federal parliament, comprising a senate and house of representatives. The senate consists of at least six members from each of the original states, elected for six years, one-half of whom are renewed every three years; while the house of representatives consists of approximately twice as many members as there are senators, the representation being in proportion to the population as shown at the last census. The number in the house in 1927 was 76. The governor-general in 1927 was Baron Stonehaven of Ury, and the ministry was as follows: Prime Minister and Minister for External Affairs, Stanley M. Bruce; Treasurer, Dr. E. C. G. Page; Vice President of the Executive Council, George F. Pearce; Home and Territories, William C. Marr; Attorney-General, John G. Latham; Postmaster-General, William G. Gibson; Trade and Customs, Herbert E. Pratten; Works and Railways, William C. Hill; Defense, Sir Thomas W. Glasgow; Health, Sir Neville R. Howse; Markets and Migration, Thomas Paterson; Honorary Ministers, Thomas W. Crawford and Alexander J. McLachlan.

HISTORY. Probably the outstanding event in the history of Australia for the year was the opening of the new federal capital at Canberra on May 9, with great pomp and ceremony, participated in by the Duke of York as representative of George V. The act of Parliament creating the Commonwealth of Australia (1900) provided that its permanent seat of government should be in territory granted to or acquired by the Commonwealth, and should be not less than 100 miles from Sydney. After years of consideration, Canberra, in the district of Yass, in the southern portion of New South Wales, was accepted as the most desirable site for the new capital. Located 209 miles from Sydney, 429 miles from Melbourne, 912 miles from Brisbane, and 2607 miles from Perth, Canberra is said to combine all the qualities of the ideal site. In March, 1913, the foundation stones of the new capitol were laid, with appropriate ceremonies, but the World War delayed its completion. The total area of the Federal Territory approximates 900 square miles. An area of 12 square miles is set apart for the site of the city proper, with further reservations of 100,000 acres for parks, boulevards, and roads, an extensive arboretum, and Duntoon Military College.

The new capital was laid out according to the design submitted by an American architect, Mr. Walter B. Griffin, of Chicago, and its pattern is strikingly suggestive, in general arrangement and outline, of that of Washington, D. C. Land in Canberra cannot be held in fee simple, the title always residing in the government. A maximum lease of 99 years, however, may be

obtained by bid at auction. Buildings must be constructed in accordance with plans previously submitted for approval. The requirements of a large population have been considered, and no slum areas of any type will be permitted. To the end of 1927 more than £5,000,000 had been expended in the city and before the capital is finally completed many additional millions will be spent in beautifying it and making it comfortable. Once the seat of government has actually been moved and the actual migration has taken place, Canberra may be expected to grow very rapidly.

The interest of the early months of the year centered around the labor movement and the labor party which controlled practically every state of the Commonwealth. A tempest was stirred up early in the year over the question of the membership of a committee, known as the Australian Industrial Mission, consisting of representatives of employers, employees, and two women observers, which was to visit the United States and survey economic and industrial conditions, methods, and efficiency. The Trades and Labor Council was particularly incensed because the Commonwealth government refused to appoint representatives of employees nominated by the council. In some quarters of the labor movement a suggestion was made to call a general strike to prevent the departure of the committee as selected by the government but the majority of the labor element refused to heed the suggestion. The annual convention of the Workers' Union, held in January, threatened a general strike if the troubles in China embroiled the Commonwealth of Australia in any way.

In the latter part of February, the executive committee of the Australian Labor Party adopted a series of resolutions, which were aimed directly at any attempt on the part of communists or communistic doctrines to get the upper hand in Australian labor circles. The doctrine as enunciated bore a striking resemblance to that issued by the Labor Party of Great Britain and the frequent pronouncements of the American Federation of Labor. Several members of the Australian Labor Party were directly accused of being inoculated with Communist theories and "boring from within" in the interest of the more radical element. One member accused was actually serving with the cabinet of New South Wales. The premier of New South Wales, however, gave him a clean bill of health and maintained that he had supreme confidence in him and had never noted any direct or indirect attempts on his part to destroy the labor party of New South Wales.

In the summer, the prime minister, Stanley M. Bruce, announced the possibility of the appointment of a commission to study the Australian constitution and its practical workings as well as to make suggestions as to how it might be changed to meet the present economic, social, and political conditions. The general headings under which the commission would function along the lines mentioned above were aviation, company law, health, industrial powers, judicial powers, navigation law, taxation, trade and commerce, the interstate commission, and the admission of new states. Of course any change recommended would have to be approved by the parliament and the people before it would become operative.

An event of importance to the United States

occurred on December 2 when Sir Hugh Denison, the Australian Commissioner to the United States, resigned, intimating that he had several important recommendations to make to Premier Bruce, which, if adopted, would change the entire system of representation between the two countries. Apparently he felt that the United States was not making sufficient allowance for the importance of Australia in the industrial and commercial world.

AUSTRIA. A republic of central Europe, proclaimed Nov. 12, 1918, after the revolution following the World War; boundaries defined by the Treaty of St. Germain, signed Sept. 19, 1919. It consists of the following nine provinces: the City of Vienna, Lower Austria, Upper Austria, Salzburg, Styria, Carinthia, Tirol, Vorarlberg, and Burgenland.

AREA AND POPULATION. According to the census of Mar. 7, 1923, the total area was 32,369 square miles and the population, 6,535,363 giving a density of 202 persons to the square mile. The area of the Austrian provinces before the World War was 39,012 square miles and the population, according to the census of 1910, 7,529,935. According to the 1923 census, the City of Vienna, which constitutes a province, had a population of 1,865,780, making up 28.55 per cent of the total number of inhabitants. The other chief cities with their populations on Mar. 7, 1923, were: Graz, 152,706; Linz, 102,081; Innsbruck, 56,401; Salzburg, 37,856; Wiener Neustadt, 36,956; St. Pölten, 31,619; Klagenfurt, 27,423; Steyr, 22,111; Mödling, 18,677; Villach, 22,070; Wels, 16,412; and Baden, 22,217. The movement of population in 1924 was: Births, 142,141; deaths, 98,055; marriages, 52,845; divorces (excluding Burgenland), 5508. The number of immigrants in 1925 was 4627.

EDUCATION. Elementary instruction is compulsory between the ages of six and 14, but exemptions are easily obtained for children of the age of 12 or over. In 1924 there were 5232 public and private elementary schools, with 29,200 teachers and 749,368 pupils. Secondary education

total in 1925, 2,128,185 acres were in Lower Austria, and 991,150 acres in Upper Austria. The chief crops with their acreage and yield in metric tons in 1925 were: Wheat, 489,833 acres, 290,433 tons; rye, 959,923 acres, 550,088 tons; barley, 352,060 acres, 200,673 tons; oats, 769,135 acres, 338,433 tons; potatoes, 440,413 acres, 2,068,422 tons; turnips, 126,713 acres, 1,341,138 tons. The foodstuffs produced are not sufficient to meet the needs of the population. The production of raw sugar in 1924-25 was 75,443 metric tons. The latest livestock census showed 282,651 horses, 1,074,864 cows, 302,103 oxen, 68,143 bulls, and 717,236 calves.

Austria was deprived of many of her mineral resources as a result of the World War but she still possesses minerals of considerable value. In 1925 the production of lignite was 3,026,519 tons, and of anthracite, 145,200 tons. The output of iron ore was 1,030,364 tons in 1925, and of pig iron, 379,921 tons. Some copper, zinc, lead, and salt (71,936 tons in 1925) are also produced. Piano making, the manufacture of motor cars, furniture, and textiles represent the only industries of any importance. The nine factories of the Austrian tobacco monopoly in 1925 made 187,074,000 cigars, 3,794,588,000 cigarettes, and 57,842 metric quintals of smoking tobacco.

COMMERCE. Austria is one of those countries which may normally be expected to show a trade deficit and yet maintain its economic equilibrium by other foreign income sufficient to offset its excess of imports over exports to some extent. It is said that a large part of the industries of the former Austro-Hungarian Empire are still owned in Austria and pay dividends to Vienna. The recovery of Vienna as a financial and commercial centre contributes important foreign revenue for services rendered. To this may be added the earnings on transit traffic, tourist trade, and remittances from Austrians abroad. The following table from an English source gives the essentials of Austrian foreign trade for the year 1926 (the figures are in pounds sterling):

	Imports £		Exports £	
	1925	1926	1925	1926
Live animals	7,537,000	7,704,000	814,000	640,000
Foodstuffs and beverages	22,339,000	22,442,000	1,076,000	930,000
Coal	6,657,000	5,960,000		
Raw materials and semi-manufactured goods	18,168,000	16,250,000	11,454,000	10,668,000
Finished goods	27,151,000	26,948,000	41,628,000	36,774,000
Gold and silver (also coined)	2,093,000	2,238,000	1,831,000	1,221,000
Total	84,089,000	81,542,000	56,803,000	50,288,000

is provided by gymnasia, realschulen, middle schools, and middle schools for girls. In 1924 there were 144 secondary schools of all types in the republic with 3437 teachers and 41,702 pupils. There are three universities maintained by the State, namely, Vienna, which has 811 teachers and 9905 students in 1924; Graz, 260 teachers and 2442 students; and Innsbruck, 183 teachers and 1565 students. There were also in 1924 two technical high schools; 36 training colleges for teachers; one theological high school; high schools for agriculture, mining, art, and music; and 12 theological colleges, of which 10 were for Roman Catholics.

AGRICULTURE. The principal occupation of the country is agriculture. In 1925 the total acreage sown amounted to 4,741,165 acres. Of the

FINANCE. The Austrian budget for 1928 (fiscal year is the calendar year) estimated total revenues at 1,631,000,000 schillings and expenditures at 1,595,000,000 schillings. There was to be in addition, an expenditure of 191,000,000 schillings of capital investment for railway electrification, improvements to road construction, and agricultural development. From 20 to 25 per cent of Austrian Federal revenues are derived from direct taxes, between 50 and 60 per cent from indirect taxes, and the rest from departmental revenues and profits of the government monopolies, particularly the tobacco monopoly. The most important single tax, an indirect one, is the sales tax, embracing practically all commercial transactions in the country. This tax alone produces one-fifth of the

government's revenue. The organization and administration of this tax has been developed with skill and with satisfactory results, so that it has encountered practically no opposition in the country. The collection of this tax is carried out "at the source" so far as possible. The composition of Austrian revenues in the year 1925, based on closed accounts, and in the years 1926 and 1927, based on budget estimates, were as follows:

AUSTRIAN FEDERAL REVENUES

[In thousands of dollars; conversion at 14.07 cents to the Austrian schilling]

Item	Actual, 1925	Per cent of total	Estimated 1926		Estimated 1927	
			Per cent of total	Per cent of total	Per cent of total	Per cent of total
Customs duties and export fees	28,267	17.0	25,336	19.3	29,266	18.4
Consumption taxes	11,945	7.2	11,158	8.5	11,763	7.4
Direct taxes	40,163	24.1	28,576	21.7	36,730	23.1
Sales tax	81,784	19.1	28,140	21.4	29,828	18.8
Miscellaneous fees	17,398	10.4	11,845	8.3	13,514	8.5
Departmental revenues	13,606	8.1	3,714	2.8	11,115	7.1
Net revenue from monopolies	23,581	14.1	23,286	17.7	26,564	16.7
Total	168,744	100.0	131,555	100.0	158,780	100.0
Of which payable to Provinces	86,217	21.7	25,608	19.5	30,476	19.2
Balance to Federal Government	130,527	78.3	105,947	80.5	128,304	80.8

The general trend in taxation was toward a reduction of direct taxes and an increase of the indirect revenues. The principal source of direct tax revenue was the income tax; this was supplemented by the corporation tax and the general tax on earned income, both being levies on net income. More and more reliance was being placed, however, on the indirect sales tax, and it was probable that this will remain indefinitely as the backbone of the Austrian taxation system. Customs revenues likewise increased steadily in recent years and, owing to the protective tariff policy, which the government was pursuing, it was probable that the present important rôle held by the customs revenue would be maintained indefinitely.

COMMUNICATIONS. Austria has approximately 4114 miles of railway lines, of which 3639 miles were operated by the State and 475 miles by private companies. The item of chief interest in connection with Austrian railways during 1927 was a discussion of the electrification programme. One of the most important undertakings in Austria was the proposal to extend the programme of railway electrification initiated in 1920 and scheduled for completion in its present form by the end of 1928. According to a plan worked out the recommendations include the addition of lines between Vienna and Salzburg, Vienna and Graz, and the Tauern Railway. The total length of these lines amounts to 605 kilometers and the annual consumption of coal to 540,000 metric tons. This group includes two very important main lines, Vienna to Salzburg and Vienna to Graz. These two lines show an average annual traffic per kilometer of 7,100,000 and 6,300,000-ton kilometers respectively, as compared with an average annual traffic per kilometer of 3,500,000-ton kilometers on those lines included in the previous electrification programme to be completed by the end of 1928. These two lines carry about double the amount of traffic of those lines completed and under construction, and are estimated to involve an expense of approximately only 20 per cent in excess of the cost per kilometer of the latter. The supply of electric power would be covered in part by the Vienna, Upper Austria,

and Styrian power plants, so that only a portion of the current needed would have to be produced in new plants to be constructed by the Austrian Federal Railways.

In October, 1927, the U. S. Bureau of Foreign and Domestic Commerce quoted from the first published report of the Austrian Federal Railways following their establishment as an autonomous concern in 1923. The report furnished rather limited financial and operating details re-

garding the railways during 1925, as follows: The length of the Austrian Federal Railways at the close of 1925 totaled 4864 kilometers, of which 1479 kilometers were double-track. In addition to this mileage, the Federal Railways were operating, for the account of private owners, 944 kilometers of additional track. Operating revenue during the year amounted to \$75,200,000 (\$87,000,000 in 1924) and operating expenses to \$71,760,000 (\$65,000,000 in 1924). The rolling stock in operation at the close of 1925 comprised 2611 locomotives, 5833 passenger cars, 32,693 freight cars, and 1836 service and mail cars. The condition of the rolling stock depreciated greatly during the war and shortage of funds had made it impossible for the railway administration to restore it to efficient normal conditions. Severe inroads on the quantity of rolling stock were made by the peace treaty in favor of the newly organized national systems in the surrounding countries, so that there was an actual shortage of rolling stock in addition to the fact that the existing equipment was in an abnormally low state of repair. Passengers carried during 1925 numbered 117,091,025 and freight carried (not including freight charged by the piece or service freight) totaled 25,282,611 tons. In 1925 passenger tariffs calculated on a gold basis amounted to approximately 87 per cent of the pre-war level, while freight rates amounted to 107 per cent of the pre-war rate. Since 1925 there had been increases in both passenger and freight tariffs, putting the former on an approximately 100 per cent basis and the latter 112 per cent of the pre-war rates.

Shortly after the War lack of coal within the country and other factors of national importance led the Austrian Government to start an extensive programme of railway electrification with which considerable progress has been made. The electrification work was being confined to the mountainous area in the western part of the country; funds for this purpose were advanced in part by the Federal Treasury, but principally came from the international League of Nations loan to Austria. At the end of 1925, 444 kilometers of the State railways had been

electrified. With the completion of electrification work under way, the railways would have at the end of 1928 some 623 kilometers under electric operation, of which 300 kilometers would be double-track lines. With the completion of this programme and the extensive electrification being carried out in Switzerland, electric traction will handle the entire service from Salzburg westward to Zurich, Berne, and the principal parts of Switzerland. Electrification in Bavaria, Germany, was likewise proceeding and will eventually connect up with the Austrian system.

GOVERNMENT. Under the provisions of the constitution which went into operation on Nov. 10, 1920, Austria was declared to be a federal republic. A president is chosen for four years by the two houses of the legislature. He may not be reelected more than once. The legislature is bicameral, comprising an assembly (Nationalrat) and a First Chamber (Bundesrat). The powers of the latter body are advisory. President in 1927, Dr. Michael Hainisch (elected in 1920 and again in 1924). The ministry was constituted on Oct. 20, 1926, as follows: Federal Chancellor and Minister of Foreign Affairs, Dr. Ignaz Seipel (Christian Socialist); Vice Chancellor, Dr. Franz Dinghofer (Pan German); Social Welfare, Dr. Joseph Resch (Christian Socialist); Agriculture, Andreas Thaler; Finance, Dr. Victor Kienbock; Commerce and Communications, Dr. Hans Schuerff; Education, Dr. Richard Schmitz; Defense, Karl Vaugin.

HISTORY

SITUATION AT THE BEGINNING OF THE YEAR. Dr. Seipel, who came into office after the fall of the Ramek government in October, 1926, was faced with a Socialist minority in parliament which seemed at the beginning of the year to cause him considerable worry and to be more in control of the situation than his own Christian Socialist and Pan German coalition. The opposition's fight on the government's scheme for old age and invalid insurance was so successful that Dr. Seipel virtually admitted defeat and requested the Socialist leader, Dr. Otto Bauer, to state definitely whether he preferred to hold new parliamentary elections in the spring or wait until the fall when the present parliament would retire anyhow. A most unusual statement on his part was to the effect that an election held in the summer months would not effect the true opinions of the people inasmuch as the farm laborers would scarcely be able to vote and many of the urban workers would be out of the cities on vacations. Dr. Bauer expressed the desire to hold the elections in the spring. For a time conditions appeared very ripe for an internal clash when the government raided the Vienna arsenal and confiscated more than 1000 firearms, which government circles held to belong to the Socialists. The latter seemed very incensed at this charge and threatened to mobilize their so-called guard, with the possibilities of strikes and bloodshed following such action. A parliamentary compromise at the last moment led to a smoothing over of the affair, in the course of the debate on which the Socialist leaders denied ownership of the arms in the legislative chamber.

THE ELECTIONS. The campaign for the election of new members to the parliament began

early in March and was on the clear cut issue of the Socialist programme versus the conservative middle class programme of Dr. Seipel and his Christian Socialist and Pan German parties. The government severely attacked the administration of the city of Vienna which was entirely in the control of the Socialists and which had the most advanced social attitude of any city in Europe. The Socialists had built almost 40,000 apartment houses for workers which were rented at an extremely low rate and had made attempts to aid the workers by establishing maternity clinics and granting clothing, etc., to mothers after the arrival of babies. The Seipel group resented this spending of money and appealed to the people on the ground of retaining as much of the good old capitalistic ideas as possible, particularly the high protective tariff.

The final results of the election, which was held on April 24, gave the Seipel coalition a clear majority in the Parliament, by a vote of 94 to 71. They lost three seats, however, but, if the coalition held together, they could easily outvote the Socialist minority. The Communists failed to gain one seat and their total of votes (70,000) represented a loss of 20,000 from the last election held in 1923. The total vote cast was 3,607,856, representing 98 per cent of the voting list and more than half of the population of Austria. The Seipel group, which won about 60 per cent of the votes cast, had its greatest strength in the rural districts. Obviously the Socialists were strongest in the cities. The only change in the cabinet was the substitution of the Farmer deputy, Yarl Hartleb, as vice-chancellor in the place of Franz Dinghofer.

UNION WITH GERMANY. The question of an economic and political union with Germany was very much to the fore during the course of the year. As noted in the preceding YEAR BOOK, Chancellor Seipel was considered as being very cold to the proposition largely because of his Roman Catholicism, which, naturally, would much prefer a close union with Catholic Italy than with Protestant Germany. He was confronted, however, with virtually a united parliament on the question of an economic, to be followed by political, union with republican Germany. Being an astute politician, Dr. Seipel bowed to the will of the majority, and in his opening address to the new Parliament enunciated his doctrines concerning such a union. He stated that the government would work to such an end, and that it would probably present a scheme for political union to the League of Nations for official action. He felt, however, that an economic union should precede political union, and, in conformity with this belief, he instigated and held a conference with several leading German industrialists, who had made a survey of Austrian industrial possibilities. The outcome of this meeting was the adoption of a plan whereby a joint commission should be appointed to devise ways and means for Germany to help Austria industrially and financially without conflicting with the field of politics. The results of the studies of these commissions, of course, would have to get the separate approval of the governments of the two countries.

DISORDERS. In the press from time to time appeared accounts of serious disorders and riots in the grounds of the University of Vienna. While in many instances they were of anti-Semitic

origin, they often took on the aspects of a struggle between the conservatives in general on one side and the Socialists and Jews on the other. Anti-Jewish rules and regulations were adopted by the authorities of the university, which resulted in several riots of fairly large dimensions. The oppressed students appealed to the Socialist government of Vienna, which gave police protection to the Jews and Socialists (often one and the same), even going into the grounds of the university to do so, thus violating a centuries-old custom that the students were to maintain their own discipline on university grounds and the police were not to enter university property for the purpose of enforcing discipline.

Of a more serious nature were the widespread riots throughout the entire city of Vienna during the second week of July, during the course of which hundreds were wounded, government buildings destroyed and records burned. A general strike added to the confusion, and it seems that only a miracle prevented the tearing of Austria apart by civil war. The cause of the outburst was the acquittal of three Austrians, who were charged with the murder of two Socialists in an outbreak in the Burgenland in February. Practically all Socialist Austria believed the accused guilty, and when the verdict was brought in they wreaked their rage on the Ministry of Justice Building, which was practically burned to the ground. The Socialists claimed that the murders were committed by Austrian Fascists, who were allowed to carry on a campaign of terror throughout the country because they felt secure from court action because the courts, themselves, were honeycombed with conservative Fascist ideas. Events in Austria from time to time certainly seem to justify the Socialist contentions. Although the government was successful in breaking up the ominous July riot, it must have been severely shaken, and the reverberations in the press of other European countries must have made it realize that its future depended in a very large degree upon the establishment and maintenance of an orderly stable government. One of the first steps taken by the government in the interest of future control of such outbreaks was the arming of the police of Vienna with revolvers, rather than with the sword, which had proved so ineffective. Needless to say the Socialists keenly resented this move and declared that it merely proved their contention that the minority, which heretofore had been able to parade any time it desired, was now to be cowed by guns and ammunition.

About the middle of November Chancellor Marx and Foreign Minister Stresemann of Germany visited Austria officially. The question of union of any kind between the two countries was not discussed, although the Germans pleaded for harmony between the two nations as far as the League of Nations was concerned, stating specifically that the Austrian representative at Geneva, Count Mensdorff-Pouilly, was more pro-British than pro-German in his actions and statements.

AUTHORS' LEAGUE OF AMERICA. A national organization of authors, artists, dramatists, and screen writers; founded on incorporated in 1912, for the purpose of: Procuring adequate copyright legislation, both international and domestic; protecting the rights and property of all those who create copyrightable

material; advising all such in the disposal of their productions and obtaining for them prompt remuneration therefor; disseminating information among them as to their just rights and remedies. The League supplies confidential information relating to publishers, theatrical and motion picture producers, art buyers, and other persons and companies engaged in the purchase, sale, publication, or production of copyrightable material. The League is divided into four departments or guilds; the American Dramatists, the Authors' Guild, the Guild of Free Lance Artists, and the Screen Writers' Guild. The officers for 1927 were: President, Owen Davis; vice president, Arthur Train; secretary and treasurer, Louise Silcox. The headquarters of the League are at 2 East 23rd Street.

AUTOMOBILE INSURANCE. See INSURANCE.

AUTOMOBILE RACING. Peter de Paolo of Los Angeles, Cal., holder of the championship in 1925, was pronounced the winner of the American Automobile Association Speedway championship in 1927. His total number of points was 1440. Frank Lockhart was second with 1040 points and George Souders, a Purdue University student, third with 1000. Souders won the 500-mile Indianapolis Sweepstakes which incidentally was witnessed by 145,000 persons, the largest crowd to attend any sports event of the year. Souders also finished first in the 200-mile Altoona race and in contests held at Toledo and Syracuse.

Major H. Seagrave of England set a new record of 1 hour, 55 minutes, 18 seconds for 150 miles at Daytona Beach, Fla., March 29, averaging 203.79 miles per hour for three miles.

AUTOMOBILES. The American automobile industry in 1927, while it did not approach the production figures of 1926, nevertheless, in many respects enjoyed one of the most important years it had ever experienced. This was due to the extensive preparations which practically all of the larger companies were making for an active production year in 1928 and vast sums were being spent in factories and equipment, not only in the United States and Canada, but in the foreign field. The shutting down of the Ford Motor works in preparation for their newly designed car restricted their output materially and also diminished the total figures for the year.

At the end of 1927 the National Automobile Chamber of Commerce, through its general manager, Alfred Reeves, submitted its usual statement of preliminary facts and figures for the automobile industry in that year. The production for the year was estimated at 3,530,000 cars and trucks, of which 3,066,000 were cars and 464,000 were trucks. Of the production of cars 2,452,000, or 80 per cent of the total number were closed cars. The wholesale value of cars manufactured during the year was given as \$2,190,000,000, and the wholesale value of trucks \$366,750,000, making a combined wholesale value of cars and trucks of \$2,556,750,000. The average retail price of the cars sold in 1927 was \$953; the average retail price of trucks was \$1,053. The tire production of the year was 66,000,000 and the wholesale value of motor vehicle tires for replacement was \$595,000,000. The wholesale value of parts and accessories for replacements and also service equipment, was estimated at \$750,000,000.

In 1927 the motor vehicle industry and allied

lines gave employment to 3,675,000 people, while the taxes on motor vehicles amounted to \$725,555,812. In 1927 the world's registration of motor vehicles was estimated at 29,900,000, of which 23,125,000, or 80 per cent, were registered in the United States. Of this number according to the State reports 20,140,000 were motor cars and 2,985,000 were motor trucks. The motor vehicle registration on American farms amounted to 4,700,000 and of 3,008,081 miles of highway in the United States, 575,000 were surfaced.

In selling the new cars, 58 per cent were sold on time and 55 per cent of the new trucks were thus sold. The average note for new cars at the time of purchase was \$574, and for used cars the average note at time of purchase was \$286. For new trucks the average note given at the time of purchase was \$840. Naturally the automobile had an important relation to other forms of business in the United States, for some 3,125,000 carloads of automotive freight were shipped over American railroads in 1927, while of the rubber imported, the automobile industry used 84 per cent. In the plate glass industry 50 per cent of the output was taken by the automobile industry, while 12 per cent of the copper produced in the United States and 14 per cent of the iron and steel were similarly utilized. In 1927 American motor vehicles consumed 9,697,000,000 gallons of gasoline and 390,000,000 gallons of motor oil. The crude rubber used in tires in 1927 was estimated at 630,000,000 lbs. and the cotton fabric so used, at 219,000,000 lbs.

The motor bus continued to be an increasing factor in American transportation and 90,000 were in use, the production of the year being estimated at 11,500, and 14,400 consolidated schools were using motor transportation and 379 street railways were using motor buses, 8600 being thus employed. Sixty steam railways were using 1175 motor buses and 58 railways were using motor trucks as a part of their shipping service, gasoline rail motor coaches on short lines being used by 199 railways.

During the year motor vehicles having a value together with parts and tires estimated at \$507,500,000 were exported, and the increase for 1927 over that of 1926 was 12 per cent. Fifteen per cent of the total production was exported. Imports of motor vehicles totaled 660. The motor vehicle retail business in the United States was distributed between 52,592 car and truck dealers, 52,086 public garages, 85,983 service stations and repair shops and 67,753 supply stores.

With 23,000,000 motor vehicles on American highways it was estimated that over 3,000,000 of these would need to be replaced each year, so that the motor industry was looking forward to continued prosperity. At the same time there was a general tendency for the average family to have more than one car and even for each adult member to have his own car. This was due to the fact that motor transport was essential in many regions where it was the only method of communication and this was particularly true in rural communities, where as a matter of fact, 56 per cent of the motor cars were owned in places of 10,000 population or less.

In 1927 for the third successive year the production of motor trucks in the United States and Canada was considerably in excess of 450,000, though the output, 464,000, showed a decrease from 1926 when it was 591,353 and 1925 when it was 473,154. On Jan. 1, 1927, some 2,700,000

motor trucks were in use, while the bus registration at the end of 1927 was estimated at a total of about 90,000 units, as compared with 80,000 the year previous.

During the year there was a demand for high-speed pneumatic tire vehicles, this being due not only to the natural demands of traffic, but also to the insistence of State motor vehicle commissions in many jurisdictions that trucks must keep up with and not retard the flow of other traffic on the highways. Figures compiled during the year indicated that professional hauling was only a small proportion of the truck operating industry and that 82 per cent of all trucks were owned by shippers, while 11 per cent were owned for use under private contract with shippers, and 7 per cent were owned by professional haulers, this last group being divided between a small number operating regularly between fixed points at fixed rates, and on fixed schedules. The larger number were in the general trucking business, although often covering a more extensive area than the former city teamsters and draymen. As indicating the leading uses of motor trucks a study of 1,300,000 trucks used in these fields afforded the following results:

R. F. D. owners	248,296
Groceries, food products	147,810
General contractors	88,858
Auto accessories	78,262
General trucking	70,735
Oils and gasoline	55,428
Lumber and logging	50,976
General merchandise	49,465
Meats and packing	40,074
Bakeries	40,058

During the year some progress was made on the difficult problem of regulation of the bus business, so as to prevent excessive competition among bus operators and yet obtain for the public the advantage of flexible motor vehicle transportation. State regulation statutes were passed in Arkansas, Missouri, Nebraska, and Texas, during the year, so that in 44 States there was some form of regulation. Up to the end of the year no bills had been passed by Congress for the regulation of interstate bus traffic, although a number were presented and the subject was under consideration by various groups, in efforts to secure fair and suitable legislation. The Interstate Commerce Commission was carrying on an investigation into the relation of truck and bus operation to the business of the railroads but no report had been presented up to the end of the year.

NEW FORD MODEL. The most important development of the year in many respects was the announcement of the Ford Motor Co., that they had decided to abandon the former Model "T" engine and car and develop an entirely new design which they would manufacture along the same lines in which they had been so successful in the past. The new car, which was displayed in December, had a 40-horse power engine capable of driving the car at a speed of 65 miles per hour, 4-wheel brakes, standard gear shift, and hydraulic shock absorbers. The bodies were of steel construction, the only wood being strips attaching the interior trim and in the soft roofing of the closed cars. The cars were finished in two-tone color combinations and in appearance were considered most attractive. The engine was of entirely new design with a bore 3-7/8 in., or

$\frac{1}{8}$ in. larger than the older model, and a stroke of 4- $\frac{1}{4}$ in., or $\frac{1}{4}$ in. greater. This was a 4-cylinder engine and at 2200 revolutions per minute developed 40 horse power, though rating for license purposes at 24.03 horse power. The Model "A" Ford, as the new car was known, was supplied with larger balloon tires, heavier and better balanced springs, and hydraulic shock absorbers, while many of the parts which previously had been bolted together were now welded so as to eliminate many sources of noise and to give greater durability. A new oiling system which was a combination of pump splash and gravity feed was installed, while cooling was secured by a centrifugal water pump and a large radiator. A new ignition was developed. The new Ford transmission was of the selective sliding gear type with standard shift affording three speeds forward and one reverse. The main shaft ran on ball bearings and the centre shaft on roller bearings, and the gears were made of heat-treated chrome steel.

After the announcement of the new Ford cars, the General Motors Co. published a statement regarding the development of their Chevrolet car, which in many respects was considered as a competitor of the Ford, although selling at about \$100 advance over the new type. This car had a longer wheel base, with 4-wheel brakes and a new type of body and radiator. The new line was placed on the market at the end of the year with a price reduction ranging from \$10 to \$50 on the different styles. In 1927 over 1,000,000 of these cars had been built.

In connection with the question of installment selling in the motor industry a notable study was published during the year entitled, *The Economics of Installment Selling: A Study in Consumers' Credit*, by Prof. E. R. A. Seligman, Professor of Economics at Columbia University. This work, which was extensively discussed, developed the conclusion that installment selling would do for the consumer what the old banking system had done for the producer and with proper safeguards and restrictions it would prove "one of the most signal contributions of the twentieth century to the progressive creation of national wealth and national welfare" and that the dangers and abuses would shortly disappear.

AYER, EDWARD EVERETT. American lumberman and museum patron, died at Pasadena, Cal., May 3. He was born at Kenosha, Wis., Nov. 16, 1841, and in 1860 crossed the plains to the Pacific Coast, later serving in the United States army in wars against the Apaches and other Indian tribes in California, Arizona and New Mexico. Establishing a lumber mill at Flagstaff, Ariz., he acquired forests and timberlands in various sections of the Southwest, and became a pioneer in supplying cross-ties to American railways, furnishing ties for most of the trans-continental railways centring in Chicago. In addition to his business activities, he became a patron of various museums in Chicago, donating to the Newberry Library of that city a collection of books on the history of the North American

Indian which was one of the most nearly complete of its kind. He also donated ornithological and ichthyological libraries, a great pewter collection, and a collection of Indian accoutrements to the Field Museum of Natural History in Chicago. Actively interested in this museum, of which he was a director, he served as its president, 1893-98. He was also a director of the Art Institute of Chicago and a member of the League to Save the Redwoods in California, serving as a member of the governing board of that organization. He was also active in historical studies. Mr. Ayer was said to have been the first man to make an automobile trip across the Sahara desert.

AZERBAIJAN, a'zer-bi-jan'. A new state constituted in 1918, consisting chiefly of the two former Russian provinces of Baku and Yelisavetpol; bounded on the east by the Caspian Sea, on the west by Georgia and Armenia, on the south by Persia, and on the north by Georgia, Northern Caucasus, and Daghestan. The official name of the state is the Azerbaijan Socialist Soviet Republic. Area, about 333,970 square miles and the population, according to official Russian figures, about 2,096,973, of whom 75 per cent are Moslem. Baku, the centre of the petroleum industry, is the capital and has a population of approximately 447,000. In 1925-26 134,855 pupils attended primary and secondary schools. There were also trade-technical schools; teacher-training centres, higher educational institutions, and workers' faculties. The oil industry, in 1925-26, had an estimated production of 336,000,000 poods. After the outbreak of the Russian Revolution in 1917, Azerbaijan, Armenia, and Georgia formed a federation, but this broke up after a few weeks, when the three constituent elements each declared its independence. Two months after the *de facto* independence of Azerbaijan was recognized by Great Britain in 1920, the Bolsheviks overthrew the government and thenceforth the government was under Soviet control.

BADEN, bā'den. A constituent state of the German Republic, with a republican form of government since Nov. 22, 1918; formerly a grand duchy in the German Empire; bounded by Bavaria on the east and Alsace-Lorraine and the Palatinate on the west. Area, 5819 square miles; population in 1925, 2,312,462, as compared with 2,195,580 in 1919. Capital, Karlsruhe, with 145,694 inhabitants in 1925. The largest city is Mannheim with 247,486 inhabitants in 1925. Of the total population of the state in 1925, 1,115,477 were males and 1,196,985 females. The majority of the population is Roman Catholic. Education is free, general, and compulsory, the schools being under the jurisdiction of the state. For higher education there are universities at Heidelberg and Freiburg. In 1926 the total area under cultivation was 2,098,142 acres. Among the agricultural products, oats, rye, barley, wheat, potatoes, and vegetables are the most important. 32,102 acres were planted to the vine in 1925 and the yield of wine was 6,315,302 gallons. In 1926, 10,000 acres were under tobacco. In 1925 there were 621,267 cattle, 412,533 pigs, 50,860 sheep, 160,897 goats, 68,194 horses. The budget for 1926-27 fixed the ordinary revenue at 228,080,000 gold marks and the ordinary expenditure at 219,700,000 gold marks.

The present constitution dates from Mar. 21, 1919, and vests the executive power in a cabinet comprising the state president, five ministers,

and three state councilors without portfolios, all of whom are elected by the legislature. Legislative power resides in a single chamber body known as the Landtag. The constitution abolishes all privileges of birth and religion and under it women are endowed with the same rights as the men, bring eligible to all public offices. There is universal suffrage for all persons of either sex over 20 years of age. The initiative, referendum, and proportional representation have been introduced. The Landtag, elected on Oct. 25, 1925, for the term ending Oct. 25, 1929, had 72 members distributed among the several parties at the beginning of 1927 as follows: Centre, 28; Socialists, 16; German Democratic party, 6; Right, 9; German People's party, 7; Communists, 4; Economic Union, 2. State president at the beginning of 1927, G. Trunk, who also held the post of Minister of Justice. Dr. F. J. Schmitt was Minister of Finance, A. Remmele, Minister of the Interior and O. Leers, Minister of Religion and Education.

BAHAMAS. A group of islands north of the British West Indies, off the southeast coast of Florida, 29 in number, of which 20 are inhabited. They also include 681 keys and over 3000 reefs. The islands, which are of coral formation, have an area of 4404 square miles and a population, according to the census of 1921, of 53,031. The estimated population on Jan. 1, 1925, was 55,423. The important islands, with their populations in 1921, are as follows: New Providence, containing the capital, Nassau, 12,975; Andros, 6976; Eleuthera, 6048; Long Island, 4659; Abaco, 3993; Exuma, 3730; St. Salvador, 4278. Elementary instruction is compulsory from the ages of 6 to 14. For the calendar year 1925, the exports totaled \$481,000, and the imports, \$1,761,000. The principal exports were sisal, sponge, lumber, tomatoes, shells, and preserved pineapples; principal imports, foodstuffs, spirits, raw materials, and manufactured articles. In 1924-25 the revenue was \$420,077 and the expenditure, \$415,577. The public debt in 1925 was \$17,861. Ship entries in 1924, 1258 vessels of 624,205 tons (440 British of 250,199 tons); clearances, 1267 vessels of 629,112 tons (470 British of 254,689 tons). The islands are administered by a governor who is assisted by an executive council and a legislative council, each of nine members and a legislative assembly of 29 members, the franchise being based on a small property qualification. Governor and Commander-in-chief in 1927, Maj. Charles William Orr.

BAKER, CHARLES FULLER. American educator, dean of the College of Agriculture of the University of the Philippines, died at Manila, July 21. He was born in Lansing, Mich., Mar. 22, 1872, and was a brother of Ray Stannard Baker, the author, and Hugh Potter Baker, the forester. He studied at Michigan Agricultural College and Stanford University, becoming a teacher of zoology and being connected with various American educational institutions. In 1912 he went to the Philippines, where he founded the Los Baños Agricultural College, which was connected with the University of the Philippines and was said to be the only institution of its kind in the Far East, having a student body of more than 5000. While at Los Baños he assembled a collection of more than 50,000 specimens of insects for the agricultural college, in addition to large collections for the

Universities of Berlin, London, Madrid, Paris, Moscow and Vienna. He was an enthusiastic collector and worker, spending his means and vitality in scientific research.

BAKU. See AZERBAIJAN.

BALCH, THOMAS WILLING. American author and lawyer, died at Philadelphia, Pa., June 7. He was born at Philadelphia, Pa., in 1869, and graduated at Harvard in 1890. Later he studied law at the University of Pennsylvania, graduating in 1895. He engaged in the practice of law at Philadelphia, specializing extensively in international law and international relations, as well as in matters of history. His more important works include: *Some Facts About Alsace and Lorraine* (1895); *The Brooke Family of Whitchurch, Hampshire, England* (1899); *The Alabama Arbitration* (1900); *Emerio Crucé* (1900); *The Alaska-Canadian Frontier* (1902); *The Alaska Frontier* (1903); *English Ancestors of the Shippen Family and Edward Shippen of Philadelphia* (1904); *The Swift Family of Philadelphia* (1906); *Balch Genealogica* (1907); *L'Évolution de l'Arbitrage International* (1908); *La Question des Pêcheries de l'Atlantique: un Différend entre les États-Unis et l'Empire Britannique* (1909); *The Arctic and Antarctic Regions and the Law of Nations* (1910); *Différends Juridiques et Politiques dans les Rapports des Nations* (1914); *Arbitration as a Term of International Law* (1915); *The United States and the Expansion of the Law Between Nations* (1915); *The Philadelphia Assemblies* (1916); *A World Court in the Light of the United States Supreme Court* (1917); and *Legal and Political Questions Between Nations* (1924).

BALDWIN, GEORGE JOHNSON. American engineer, and active in shipping circles and the development of public utilities in the southern United States, died at Baltimore, Md., March 4. He was born at Savannah, Ga., Aug. 18, 1856, and after taking a special course in mining engineering at the Massachusetts Institute of Technology became chemist for the Woodstock Iron Company at Anniston, Ala., 1887-79, and superintendent of the Bradley Gold Mine, Nacoochee, Ga., 1878-79. In the latter year he became interested in the firm of Baldwin & Company, cotton factors and dealers in fertilizers at Savannah, Ga., being a partner 1880-81. In 1887 he organized the Baldwin Fertilizer Company, serving as its president and general manager until 1894, and in 1898 became associated with the engineering firm of Stone & Webster of Boston, Mass., organizing many Southern public utility companies to manage and operate various light and power utilities. In 1917 he became president of the Pacific Mail Steamship Company, and was chairman of the board of the New York Shipbuilding Company and the American International Shipbuilding Company, which built the Hog Island shipyard and many ships during the War. He organized the Edison Company of Savannah, which afterwards merged with the Savannah Electric Company, and was instrumental in developing light, power and electric traction at Jacksonville, Tampa, Pensacola and Key West, Fla. At the end of the War the American International Corporation went into South America, where a number of municipal projects which had become disorganized during the War were revived. Mr. Baldwin was active in social, educational and charitable enterprises. He was a founder member of the Na-

tional Marine League, and a member and manager of the American Bureau of Shipping.

BALDWIN, SIMON EBEN. American jurist and Governor of Connecticut, 1911-15, died at New Haven, Conn., January 30. He was born at New Haven, Conn., Feb. 5, 1840, the son of Roger Sherman Baldwin and Emily Perkins Baldwin, and after graduating at Yale in 1861 studied law at Yale and Harvard, being admitted to the bar in 1863. In addition to practicing, he was instructor in law and professor at the Yale University Law School from 1869 until 1919. As early as 1873 he was a member of a commission to revise the general statutes of the State, and in 1879 he was a member of the commission for simplifying its legal procedure. In 1885 was a member of a commission for devising a better system of taxation, and drew up its report. In 1893 he was appointed associate justice of the Supreme Court of Errors of Connecticut, and in 1907 became its chief justice, serving until 1910. He was Governor of Connecticut for two successive terms, 1911-15. After the expiration of the second term he became chairman of a committee to revise the taxation system. In 1890 he was president of the American Bar Association, in 1897 of the American Social Science Association, and from 1899 to 1901 of the International Law Association. From 1894-96 he was president of the New Haven Colony Historical Association, and he was also at various times president of the American Historical Association, the Association of American Law Schools, the Connecticut Society, the Archaeological Institute of America, the Connecticut Academy of Arts and Sciences, the American Political Science Association, and the American Society for Judicial Settlement of International Disputes. In 1921 he was made an associate of the Institute of International Law, and he was a member of many learned societies, including L'Institut de Droit Comparé. Elected Governor of Connecticut as a Democrat, he was considered a possible Democratic candidate for the Presidency, and in the Baltimore convention of 1912 received the votes of Connecticut and Vermont, but was then set aside for Woodrow Wilson. In 1914 he was a Democratic candidate for United States Senator, but failed of election. In 1912 he was in a controversy with former President Roosevelt over the Federal employers' liability law, which he as judge declared to be unenforceable through the state courts. This opinion led to Colonel Roosevelt's denouncing Judge Baldwin's position as reactionary, and the controversy became so bitter as to give rise to talk of a possible libel suit.

Judge Baldwin was a man of wide interests, including religious matters, and in 1913 he predicted a virtual reunion of not only the Protestant denominations, but also that of Protestantism and Roman Catholicism through the medium of the Lutheran Church. Judge Baldwin wrote extensively, his more important works including: *Digest of the Decisions in the Connecticut Law Reports* (2 vols. 1872, 1882); *Baldwin's Cases on Railroad Law* (1896); *Modern Political Institutions* (1898); (co-author) *Two Centuries' Growth of American Law* (1901); *American Railroad Law* (1904); *American Judiciary* (1905); *The Relation of Education to Citizenship* (1912); *Life and Letters of Simon Baldwin* (1919); *The Young Man and*

the Law (1919); and (co-author) *Osborn's History of Connecticut* (1925).

BALKAN STATES. The collective term applied to those states which make up the Balkan peninsula in southeastern Europe north and west of the Aegean Sea. See ALBANIA, BULGARIA, GREECE, JUGO-SLAVIA, RUMANIA, and TURKEY.

BALTIC PROVINCES. (Now BALTIC STATES.) The name formerly applied to the Russian provinces of Courland, Esthonia, and Livonia, held by Germany for a time during the war and relinquished at the end of 1919. They now comprise the two new republics: Estonia, formed out of the province of the same name and the northern part of Livonia; and Latvia, formed out of Courland and the southern part of Livonia. See ESTONIA and LATVIA.

BALTIMORE. See GARBAGE AND REFUSE DISPOSAL.

BALTIMORE AND OHIO RAILROAD CENTENARY. The 100th anniversary of the meeting on Feb. 28, 1827, of a small group of citizens of Baltimore interested in transportation at the house of George Brown for the purpose of formulating plans for the organization of the Baltimore and Ohio Railroad, was celebrated with appropriate exercises under the auspices of the Baltimore and Ohio R. R. The employees of the company staged three historic episodes written by Margaret Talbott Stevens and directed by Adele Gutman Nathan, entitled "The Birth of a Railroad." The first depicted the meeting of Baltimore citizens at which the railroad was planned; the second, the laying of the first stone of the line on the farm of John Carroll, near Baltimore; the third the Mount Clare shops in 1830, and an impersonation of Peter Cooper. A dinner was given in the evening at which President Daniel Willard announced the plans for a historic pageant at Halethorpe. Also appropriate addresses were delivered by Mayor Howard W. Jackson, and the Hon. N. D. Baker. The sentiments expressed in all of the addresses were essentially that the celebration commemorated not merely an important milestone in the Baltimore & Ohio Railroad's own history, but the rounding out of a century of definite American railroad achievement.

During the period September 24-October 15 the Baltimore and Ohio Railroad held at Halethorpe an exposition called the "Fair of the Iron Horse" to mark the 100th anniversary of the beginning of the first railroad in the United States operated for the public handling of passengers and freight. The fair was divided into two parts, one consisting of displays of historic interest illustrative of the growth of the modern railroad: Rails, ties, bridges, signal and safety, telegraph and telephone devices, the first sleeping car and the latest; and many other interesting, educational exhibits, which were housed in large buildings. The other was a pageant representing the chief steps in the development of transportation. The pageant was repeated daily and was the outstanding feature, being witnessed by some 50,000 to 100,000 spectators daily in place of from 15,000 to 20,000 as anticipated. It was a moving drama of transport, portraying the unfolding of the full scheme of inland transportation in the United States from earliest times up to the present. Included in the spectacle was, first, the Indian mode of travel, the primitive prairie schooners, stage-coaches, post-chaises, and on through the horse-drawn

age. This was followed by the tiny "Tom Thumb" (the first American built locomotive) of 1829; the curious "grasshoppers" of the thirties, the odd-looking camelbacks of the forties, the veteran engines of the Civil War and up to the steel giants of to-day, representing the leading railway systems of the United States. In this long, winding line was a number of floats, depicting the inception and start of the Baltimore & Ohio, as well as other events associated with the railroad development. These displays were fully described in a valuable illustrated *Catalogue of the Centenary Exhibition of the Baltimore and Ohio, 1927*. See CELEBRATIONS.

BANKERS' ASSOCIATION, AMERICAN. The dominant national organization of banks in the United States. It has a membership of over 21,000 banks, out of a total of 28,000 in the country, and comprises among its members an estimated 90 per cent of the nation's aggregate banking capital funds of \$7,800,000,000 and total resources of \$65,000,000,000. The Association has four major divisions, each devoted to the special interests, technical advancement and general welfare of the respective classes of banks indicated in their titles, as follows: the National Bank Division, the Savings Bank Division, the State Bank Division, and the Trust Company Division. Within the organization there are also three sections devoted to general inter-bank interests as follows: the American Institute of Banking Section, which is the educational arm of the organization, with an enrollment of 35,000 students from banks in all parts of the country and a general membership of 60,000; the Clearing House Section, which promotes the organization of city and county bank groups for the purpose of facilitating business transactions and common welfare through clearing houses, clearing house examiner systems, and mutual credit bureaus; and the State Secretaries Section, which forms a link between the national organization and the State bank associations that exist in every State. There is also a Protective Department which prosecutes continually a country-wide campaign of prevention, protection, and investigation for all member banks, in respect to criminal operations against banks. The Association conducts, also, a Legal Department, which keeps bankers informed on developments in the field of banking law and watches the interests of banking and the public in both State and National legislation, in connection with the State and Federal legislative committees and councils of the Association, which seek to present the best banking viewpoints to the legislators.

During 1927 the most important action in respect to legislation was the completion of successful activity leading to the passage of the McFadden Bill, a measure designed to modernize the national bank law and to equalize the privileges of National banks with those of State chartered banks, to recharter the Federal Reserve banks for an indeterminate period, and to restrict branch banking within the Federal Reserve System on conditions equitable with such branch banking privileges as are enjoyed by State banks.

Another outstanding activity was the carrying on of an extensive research into the causes of bank failures and it was duly suggested that the remedy lay in larger minimum capital for

banks, the granting of charters only where there was a real need for increased banking facilities, more drastic State supervision of banks, and the organization of group bank associations for mutual help.

The American Bankers' Association Educational Foundation completed its campaign in 1927 to raise a fund of \$500,000 to be employed in furtherance of scholarships and research in banking and finance in colleges. In addition, the Education Commission conducts lectures on banking and business in schools and civic clubs throughout the country.

Each autumn the Association holds its annual convention, which draws up the organization's policies. In the spring it holds a meeting of its Executive Council, a representative body proportioned to the membership in all the States, and qualified to take action upon certain Association matters. The continuing activities of the Association are carried on by a permanent staff, functioning in the national headquarters of the organization at 110 East 42nd Street, New York City, under the direction of the Executive Manager, Fred N. Shepherd. There is also an Administrative Committee, composed of fifteen members including the national officers, heads of the various divisions and sections, and certain others, which stands as the ad interim governing authority between meetings of the convention and the Executive Council. The officers for 1927-28 were: Thomas R. Preston, President Hamilton National Bank, Chattanooga, Tenn., president; Craig B. Hazelwood, Vice-President Union Trust Company, Chicago, Ill., first vice-president; John G. Lonsdale, President National Bank of Commerce, St. Louis, Mo., second vice-president; W. D. Longyear, Vice-President Security Trust & Savings Bank, Los Angeles, Calif., treasurer.

BANKS AND BANKING. The year 1927 was a period of general expansion; and, on the whole, of general prosperity in the banking system of the United States. Growth of operations was substantial, while there was probably an improvement in the strength of the banking system from a general viewpoint as evinced in a distinctly better condition of solvency, reflected in a much smaller number of failures. Nevertheless the year was not in important respects a period of improvement in underlying banking conditions, or in the strength of credit; and the end of the twelve months found the country faced with some serious questions which were believed to require early solution.

NATIONAL BANKS. The national banking system had for some years prior to the opening of 1927 been suffering from the competition of state banks, and had shown a disposition to lose members. Recognition of this state of affairs led to agitation for the adoption of the McFadden Bill which became a law on Feb. 25, 1927, and which held out various inducements to banks to become members of the national system—among them a considerable relaxation of previous restrictions upon lending, as well as a modification of conditions under which the amalgamation of banking institutions may take place. Although the remaining months of the year were too short a time to testify fully to the effect of the McFadden Act the consensus of banking opinion, and the official view of the Comptroller of the Currency, was to the effect that it had been influential in restoring the

popularity of the system. The resultant change in the composition of the national banking system was outlined by the Comptroller of the Currency in his report at the close of 1927 as follows:

"It was freely predicted by the supporters of the so-called McFadden bank bill that its enactment by Congress would bring new life to the system of national banks because under the proposed act national banks would be able to perform every phase of banking carried on by State banks and trust companies. The McFadden Bank Act was approved by the President on Feb. 25, 1927, and although it is too early to judge its full effect—the act having been in operation for less than nine months—it has fully justified itself, as the additions to the resources of the national banking system have more than offset the losses during the three-year period prior to the enactment of the act."

Brief analysis of the actual condition of national banks is furnished by the accompanying table in which chief assets and liabilities of the system are contrasted for a series of dates; from this showing it will be seen that the system had steadily enlarged in its contacts with the public as shown by loans and discounts, investments, deposits, and other principal items. For the year the average dividend of national banks (measured on capital and surplus) was slightly less than 7 per cent while the total net addition to profits was \$252,319,000, or about \$3,152,000 more than for the preceding year.

FEDERAL RESERVE MEMBERS. The position of Federal Reserve member banks is not identical with that of national institutions because of the fact that the Reserve System includes some

1287 state banks and trust companies within its membership, as well as the entire body of national institutions—which are obliged to retain membership in the system. The group of member banks is therefore rather a more representative group than that of the national institutions. The figures for 659 representative members (including both national and state banks and trust companies) situated in 100 cities probably include about 45 per cent of the entire assets of the system. The condition of these banks as reflected in their statement for the last week of the year and as contrasted with the position a year earlier is shown by the table on p. 99.

From this it will be seen that there was a very decided expansion of deposits amounting in the aggregate to about \$1,370,000,000 while loans and discounts increased \$813,000,000 and investments by \$811,000,000.

The movement throughout the year was steadily upward and there was an increasing tendency to become fully "loaned up" so that at the close of the twelve months there was reason to believe that any demand for further enlargement of credit would result in a correspondingly large resort to Federal Reserve banks for rediscount accommodation.

STATE BANKS AND TRUST COMPANIES. The situation of State banks and trust companies underwent changes substantially parallel to those reflected in the case of national institutions. Owing to the varying dates at which such banks report in the several states a combined statement based on State returns is impossible, the only available aggregate statement being that furnished by the Comptroller of the Currency as of June 30, 1927. This statement is of interest

	Dec. 28, 1927	Week increase (+) decrease (-)	Year increase (+) decrease (-)
Loans and investments—total	\$21,819,635,000	+\$31,976,000	+\$1,624,209

for purposes of comparison with that of the national banks already furnished although it reveals no movements of a distinctly independent character. The leading features of it are as shown above.

FEDERAL RESERVE BANKS. Federal reserve banks underwent no far reaching changes during the year, their total extension of credit being curtailed by about \$100,000,000. Up to the opening of autumn they had been gaining gold but due to commitments on their own part and those of members for the shipment of gold they lost about \$150,000,000 subsequent to October 1 and closed the year with a net shrinkage of \$113,000,000. Changes in their principal items may be noted in the accompanying condensed statement which compares the situation at the end of 1927 with that which existed a year earlier. It will be noted from the statement that Federal reserve notes which had amounted to \$1,812,000,000 at the opening of the year were practically steady with \$1,813,000,000 at the close of 1927 while reserve balances which had been \$2,351,000,000 had increased to \$2,431,000,000. No serious significance is to be found reflected in these minor changes. Continuation of the general inflationary movement that had been in progress throughout the year was found chiefly in the statements of the member banks and had not extended itself to the Federal Reserve banks. The reserve banks which had opened the year with a 4 per cent discount rate maintained it till the latter part of the summer when it was reduced to 3½ per cent and continued at that figure throughout the remainder of the year. General opinion held to the view that the rate was too low and that as a result of it the tendency of credit was to expand too rapidly, particularly in the stock market.

RESOURCES AND LIABILITIES OF THE TWELVE FEDERAL RESERVE BANKS COMBINED

[In thousands of dollars]

Resources	Dec. 28, 1927	Jan. 5, 1927
Gold with Federal Reserve agents	1,469,255	1,419,755

BANK CREDIT. The figures which have already been given review in a general way the movement of bank credit during the year but some of the less obvious phases of the situation call for attention. Perhaps the most outstanding of these was the enormous expansion of loans in the stock market. Two regular sets of figures on this subject are now made public, the one that of the New York Stock Exchange which reflects the aggregate loans made by all classes of banks to members of the Exchange, and the other of the Reserve Board which shows loans made by member banks in the New York district to brokers. The two sets of figures run fairly parallel to one another, although the stock exchange usually shows a higher level by about \$500,000,000 or more. During the year, loans as reported by the Stock Exchange rose to \$4,200,000,000, an increase of about \$1,100,000,000 while those reported by the Federal Reserve Board increased to approximately \$3,700,000,000, an advance of some \$750,000,000. This immense expansion of brokerage loan credit was rightly regarded as a serious menace to financial and banking stability, although up to the close of the year it had not resulted, as on many former occasions, in any severe reaction of market quotations. As to credit in other aspects, the Reserve Board from time to time expressed the opinion that there was a tendency toward a growth of "frozen" loans in banks or a tying-up of bank obligations in a much more fixed form than heretofore, with decline in the holdings of paper eligible for rediscount. There seemed to be no question that this situation continued well up to the close of the year, and that with some banks it represented a persistent state of affairs whose effects would be notable if there should be any serious stringency or other condition calling for rediscount accommodation.

BANK FAILURES. During the first half of the year 1927, bank failures continued to furnish a cause of anxiety and unrest, as had been true for the two years preceding. A turn for the better was noted soon after the middle of the year. This was in part due to the fact that agricultural business had shown improvement, the result being that farmers were in better position to meet their obligations, and bankers more disposed to lend to them, while it was also in part due to the circumstance that, during the past two or three years land values had been pretty well "liquidated," or reduced to their eventual values as compared with other classes of property.

The Comptroller of the Currency making his annual report at the opening of Congress was obliged to report the total number of national bank failures during the year ending on November 1 as 135 or an increase of 44 as compared

with the preceding year, but he was able to note that of these, 111 had occurred prior to July 1 while figures compiled by the Federal Reserve Board for all banks showed an approximate total of bank failures both national and state up to the end of November, 1927, amounting to 614 with deposits of \$222,000,000 as compared with 956 and deposits of \$272,500,000 for the year 1926. Reduction of failed assets took place in about the same proportion as reduction in actual number of banks which were forced to the wall.

This improvement in bank failure conditions was apparently in no wise due to either legislation or alteration in the severity of supervision, or on the whole to better credit conditions. It appears to have been merely the gradual wearing out of an epidemic of bank failures resulting from post-war agricultural inflation. The American Bankers' Association in its annual session at Houston, Texas, received and adopted a report on the bank failure situation which ascribed failures largely to the existence of many weak institutions, unable to bear local competition, and recommended the usual methods designed to strengthen the banking system against failure. In connection with failures, it is also to be noted that mergers and amalgamations continued more actively than ever thus eliminating weak institutions and avoiding failures. The Comptroller of the Currency's annual report noted 400 cases in which state banks had been amalgamated with national, while there were additional amalgamations among state institutions whose number is not exactly known, but probably ran to 100-200 additional. The tendency of banking in the United States was still markedly toward a reduction in the number of institutions.

BRANCH BANKING. Branch banking whose spread had been the primary reason for the adoption of the McFadden act, made comparatively little advance in legislative position during the year but continued to increase in practice through the actual establishment of new branches. The McFadden act both expedited it in some particulars, and retarded it in others. During the year, about 127 new branches were organized by national banks (in cities), while, through the amalgamations already referred to, four hundred other branches were added as already noted, the combined institutions retaining the former banks of practically every case as branches of the merged institutions. In some of the States, under legislation already existing, numbers of new branches were added, but the McFadden act effectually suspended the growth of such branches (except within cities and under the restrictions laid down in the act) for the members of the Reserve System. There was some expansion of "chain" banking, although the disasters that had overtaken sundry already existing chain banks served to afford a warning against the hazardous exploitation of this sort which had previously been in progress. On the whole, the year was a period of decided advance in the actual practice of branch banking, with an increasing probability of further great enlargement to occur later on through modification of legislation, notwithstanding that the precise direction to be taken by such legislation remained obviously unsettled.

INTERNATIONAL RELATIONS. There was little or no growth in the development of American banking abroad, the common consensus of opinion among the larger institutions being against

expansion of this variety. On the other hand the closeness and extent of American banking ties with foreign countries undoubtedly increased. Secretary Mellon in his report at the close of 1927 estimated that American institutions were probably carrying about \$2,000,000,000 on open deposit account in favor of foreign institutions, while the amounts carried abroad by American banks were allowed to increase materially, owing to the very considerable progress and the stabilization of foreign currencies and the fact that attractive rates of interest could be obtained in London and elsewhere. Federal Reserve banks established credits (announced to the public) during the year for the Banks of Poland, Italy, and others and conducted an extensive business in earmarking gold as a means of avoiding the actual movement of the metal into and out of the United States. It was characteristic of the transactions of the year in foreign trade that they were carried on with a freedom or security superior to any that had existed since the pre-war period, this being largely the outcome of conditions already referred to in foreign monetary and banking systems.

CONDITIONS AT CLOSE OF YEAR. Banking problems at the close of the year centred around the probable movement of gold as a result of European currency adjustments and the effect that such movements of gold would have upon the greatly expanded structure of credit in the United States. Such influence in its indirect bearing upon stock exchange values naturally constituted the chief basis for anxiety in financial circles while possible ultimate reaction upon the price structure and upon business in general was also generally recognized as an element of no little importance in the situation.

BAPTISTS. In 1927 there were in the United States 14 bodies comprising that branch of the Christian Church known as Baptists, which numerically constituted the second largest Protestant group. While the Baptists trace their origin to the Protestant Reformation in the sixteenth century and churches were found in that period in Germany and Switzerland, the first Calvinistic Baptist Church was formed in London in 1638 and the First Baptist Church in America was probably established by Roger Williams in Providence, R. I., in 1639, although this honor is disputed by the First Baptist Church of Newport, R. I., organized the same year or shortly after. As a result of political differences, and particularly on account of the question of slavery prior to the Civil War, the Southern Baptists withdrew from the national organization in 1845, forming the Southern Baptist Convention, which since that time has functioned not as a new denomination, but as an organization for the purpose of directing missionary and general evangelistic work in the churches of the Southern States. A National Baptist Convention representing the negro churches was also formed. In addition to the main body, other divisions early began to appear. These were known as "Primitive," "United," "General," "Free," etc. In its polity the church is congregational, each church being sovereign as to its own discipline and worship. Applicants for the ministry are licensed to preach by the church in which they hold membership.

Statistics prepared by the American Baptist

Year Book in 1927 showed in the United States a total of 54,926 churches, with 43,687 ordained ministers; 2123 local associations; and 325,386 baptisms during the year, making a membership of 8,347,331. Sunday schools numbered 47,169 with an enrollment of 4,915,707. Church property was valued at \$426,416,000, and contributions amounted to \$76,031,654, of which \$61,490,438 was for current expenses and \$14,541,116 for benefices. These figures were divided among the three main groups of the denomination as follows: The Northern Baptist Convention, composed of 35 State conventions reported 8285 churches; 424 associations; 8458 ministers; 65,951 baptisms during the year; 1,399,931 church members; 7387 Sunday schools with a membership of 1,150,014; and contributions amounting to \$34,212,858. The Southern Baptist Convention consisted of 18 State conventions and had 26,003 churches; 994 associations; 18,569 ministers; 3,708,253 members, of whom 195,858 were baptized during the year; 21,777 Sunday schools, with 2,274,269 members; and contributions of \$40,106,791. There were 26 Negro Baptist Conventions with 20,665 churches; 705 associations; 16,698 ministers; 3,253,369 church members, 64,042 of whom were additions; 1,055,973 Sunday school scholars in 18,032 schools; and \$2,199,823 in contributions. Could statistics have been adequately and correctly reported, they would have revealed a Negro Baptist constituency approximating 5,000,000.

In the Dominion of Canada there were three conventions; churches numbered 1335; ministers, 866; members, 144,537, 6261 being additions; 1268 Sunday schools, and 118,581 scholars; and contributions to the amount of \$2,858,001. There were 93 churches in Mexico, with 49 ministers and 6853 members.

The denomination maintains in the United States and Canada 246 educational institutions, which in 1927 had 88,317 students, 5472 instructors, property aggregating \$119,635,800, endowments valued at \$122,123,411, and an income for the year of \$35,394,471. Of these institutions, the Northern Baptists maintained 61, the Southern Baptists 118, the Colored Baptists, 60, and 7 were in the Dominion of Canada. There were 32 orphanages, 31 homes, and 37 hospitals under the direction of the denomination. Large staffs of workers were engaged in home missions and in foreign missions in India, Burma, China, Japan, the Congo, the Philippines, and European countries.

In addition to several unorganized groups of foreign-speaking Baptists in North America, there are the following organized bodies which hold their own conferences: German, Swedish, French-speaking Baptists of New England, Finnish Baptist Mission Union, American Magyar (Hungarian), Italian, Danish, Norwegian, Czechoslovak, Polish, Rumanian Baptist Association, Portuguese Baptist, and Russian-Ukrainian Baptist Conferences. Statistics for these bodies in 1927 were as follows: Churches, 917; ministers, 690; baptisms, 4033; membership, 82,023; Bible schools, 807; Bible school enrollment, 86,758; property valuation, \$11,764,600; contributions, \$2,519,971.

Smaller branches of the denomination, differing in various respects from the main branches of the church, include the following: Six-Principle Baptists (The International Old Bap-

tist Union), Seventh-Day Baptists, Free Will Baptists, Colored Free Will Baptists, Free Will Baptists (Bullockites), General Baptists, Separate Baptists, Regular Baptists, United Baptists, Duck River Primitive Baptists (Progressive), Scandinavian Independent Baptists, and Two-Seed-In-The-Spirit Predestinarian Baptists. See also BAPTISTS, FREE.

The denomination maintains several publishing houses, of which the most important is the American Baptist Publication Society in Philadelphia. The official periodical of the Northern Baptist Convention is *The Baptist* (Chicago); of the National Baptist Convention, the *National Baptist Voice* (Nashville); while many sectional publications represent the Southern Baptist Convention.

The Baptist World Alliance was organized in 1905 and meets every five years; the last meeting was held in July, 1923, in Stockholm, Sweden. Its relationship to the Baptist churches is purely advisory and its purpose is discussion of interests common to the denomination. The *British Baptist Hand Book* for 1927 prepared the following statistics of the denomination in 1926:

	<i>Churches</i>	<i>Ministers</i>	<i>Members</i>
America	59,643	50,295	8,568,955
Europe	10,922	4,790	1,686,960
Asia	3,064	1,895	354,251
Africa	865	345	67,727
Australasia	432	361	82,811
Total	74,926	57,686	10,635,704

BAPTISTS, FREE. A branch of the Baptist denomination, which by 1927 had practically completed its policy of merging with the Northern Baptist Convention. There was but little independent activity of the Free Baptists, yet the General Conference of the Free Baptists, the national incorporated organization, still preserved its legal existence and powers. Estates in which life interests terminated or other entailments were removed, were still coming to its treasury. The majority of Free Baptist ministers, churches and members were included in the enumeration of the Northern Baptist Convention. Alfred Williams Anthony was serving as corresponding secretary and treasurer. See BAPTISTS.

BAR ASSOCIATION, AMERICAN. A national association organized in 1878 to advance the science of jurisprudence, the administration of justice, harmony in legislation, and the observance of legal precedents throughout the United States, as well as to uphold the legal profession and promote good understanding among its members. The fiftieth annual meeting, held at Buffalo, N. Y., Aug 31, Sept. 1, 2, 1927, was attended by 1600 delegates. The retiring president, Charles S. Whitman of New York, in his opening address, summarized the work of the Association throughout the years of its existence; spoke of the progress made during the year in the clarification of laws relating to public utilities; stressed the need for further modifications in the Sherman Law and the Clayton Act to meet the needs of business conditions in 1927; and touched upon the new legal problems and regulatory legislation relating to aerial communication. George H. A. Montgomery, K. C., bâtonnier of the Montreal Bar, addressed the Association on "Forests and Water-powers of

the Province of Quebec and the Laws Appertaining to Their Development." Among other speakers were M. Maurice Bokanowski, Minister of Commerce, France, who spoke on the necessity of uniform laws governing trade and transportation between the various nations, and the need for conciliation and cooperation in international relations; and William H. Taft, who welcomed and presented the Right Honorable Lord Hewart of Bury, the Lord Chief Justice of England. Lord Hewart spoke on the changing character and aims of much of the newspaper press, pointing to the need for accurate and adequate information upon public affairs, and brought out the bond between England and the United States in the heritage of the common law, which is founded on principles of justice and freedom; Frank H. Mott also spoke, on the subject of "Grover Cleveland—An Appreciation." The convention devoted considerable discussion to and passed a recommendation relating to amendments to the United States Anti-Trust Law. The Standing Committee on Air Law reported to the meeting the results of their consideration of two problems relating to Air Law: first, the new Federal radio legislation, and second, the operation of the new laws affecting aviation. Reports of committees adopted without opposition were those of the Admiralty and Maritime Law, Air Law, American Citizenship, Jurisprudence and Law Reform, Commerce, Commercial Law and Bankruptcy, International Law, Professional Ethics and Grievances, Uniform Judicial Procedure, Change of Date of the Presidential Inauguration, Legal Aid, Insurance, and the Incorporation of the American Bar Association. Officers elected at the meeting were Silas H. Strawn, Chicago, President; John H. Voorhees, Sioux Falls, S. D., Treasurer; William P. McCracken, Chicago, reflected Secretary. The headquarters of the Association are maintained at 1119 The Rookery, 209 S. LaSalle Street, Chicago.

BARBADOS. An island colony of Great Britain, lying to the east of the Windward Islands; the most easterly of the Caribbean Islands. The area is 166 square miles and the population, according to the census of 1921, 156,312; estimated, Dec. 31, 1925, 162,211. The capital and chief city is Bridgetown, with a population of 13,486. In 1925 the average attendance in the elementary schools was 14,220 out of an enrollment of 22,180. In 1924 there were 5227 births and 4692 deaths. The figures in pounds sterling for revenue, expenditure, imports and exports, and public debt for 1925-26 were as follows:

Revenue	\$404,138
Expenditure	894,250
Imports	2,298,777
Exports	1,421,085
Public debt	591,000

The principal imports were cotton manufactures, manures, flour, dried fish, machinery, salt beef and pork, and rice. The principal exports were sugar, molasses, raw cotton, and rum. The administration is under a governor assisted by an executive council, an executive committee, a legislative council of nine members appointed by the king, and an assembly of 24 members elected annually by the people. Governor in 1927, W. C. F. Robertson.

BARLEY. The barley production in 1927 of 31 countries reporting to the International Institute of Agriculture, Rome, was estimated at 1,101,300,000 bushels, an increase of 9 per cent over the production of 1926 and of 15.5 per cent above the average yield for the five years 1921-1925. The increase in area for the two periods was only $\frac{1}{2}$ per cent and 6 per cent respectively. The yields of the leading barley producing countries, exclusive of the United States, were as follows: Germany 122,733,000 bushels, Canada 98,242,000 bushels, Spain 89,485,000 bushels, Poland 74,871,000 bushels, Japan 71,655,000 bushels, Rumania 61,136,000 bushels, France 55,572,000 bushels, Czechoslovakia 55,022,000 bushels, Algeria, 39,500,000 bushels, England and Wales 38,840,000 bushels, French Morocco 36,744,000 bushels and Korea 34,898,000 bushels. India in 1926 produced 120,589,000 bushels and Argentina in the crop year 1926-27 18,372,000 bushels.

The United States in 1927, according to estimates published by the Department of Agriculture, produced 265,577,000 bushels on 9,492,000 acres, the rate per acre being 28 bushels. As compared with 1926 these figures indicate increases of 80,872,000 bushels, 1,522,000 acres and 4.8 bushels respectively. The average farm price on Dec. 1, 1927, was 67.8 cents per bushel as against 57.5 cents per bushel, the corresponding price the preceding year. At these prices the total value of the 1927 crop was \$180,127,000 and that of the crop of 1926 \$106,237,000. Both yield and price increased in 1927 and raised the total value of the crop. That barley is gaining in popularity as a feed crop was indicated by the fact that in nearly all of the 35 States reporting yields, these were increases in acreage.

The production of the leading barley producing States was as follows: Minnesota 45,090,000 bushels, North Dakota 42,406,000 bushels, South Dakota 32,670,000 bushels, California 27,335,000 bushels, and Wisconsin 21,390,000 bushels. North Dakota devoted 1,663,000 acres, Minnesota 1,503,000 acres, and South Dakota 1,089,000 acres, these being the only States with more than a million acres. The total area of these three States was nearly one-half the total barley area reported for the year. The average farm price on December 1, 1927, in the different States ranged from 55 cents per bushel in Kansas and Nebraska to \$1.10 per bushel in North Carolina. During the year ended June 30, 1927, the United States exported 17,044,000 bushels of barley as compared with 27,181,000 bushels during the preceding fiscal year. The Federal grain standards for barley were amended and the order became effective Sept. 15, 1927. The principal change raised the maximum moisture content permitted from 14.5 per cent to 15.5 per cent.

BARNARD COLLEGE. See COLUMBIA UNIVERSITY.

BARTLETT, JOHN. Arctic explorer, died at Fredericton, N. B., April 4. He was born at Brigues, Newfoundland, in 1843, and was early trained at sea, commanding at the age of 21 a wooden vessel, the *Panther*, which sailed from Newfoundland to Scotland to be fitted with steam engines and propeller. He returned in the following year, 1855, as captain of this vessel, which was the first steamship to be employed in sealing. He followed that industry for many years, becoming well acquainted with Arctic waters. He accompanied Dr. Isaac I. Hayes in

1869 in his exploration of the northwestern coast of Greenland, and established a reputation which led Commander Robert E. Peary later to select him as a member of his first Arctic expedition. His activities at sea extended over more than half a century, and were characterized by the absence of serious misadventures. He was thanked by the Danish government for saving the lives of the crew of a Danish trading vessel which had been wrecked in Arctic waters.

BASEBALL. The New York American League Club, familiarly known as the "Yankees" captured the world series and thereby the professional baseball championship in 1927. Their opponents in this classic were the Pittsburgh Pirates, who had won the pennant race in the National League. The series was woefully one-sided, the American League representatives carrying off the laurels with four straight victories. The Yankees in winning the championship flag in their own league were confronted by the weakest sort of opposition, whereas the Pirates succeeded in gaining the National League honors only after one of the closest struggles in baseball history. The Yankees, incidentally, set a new American League record by scoring 110 victories out of 154 games played.

George Herman ("Babe") Ruth was once more the unsurpassed thrill producer and gate attraction. He accomplished what was regarded as the impossible feat of knocking out 60 home runs during the season, thus excelling his world record of 59 which he established in 1921. More than 5,000,000 persons attended the American League games in the various cities of the circuit despite the insurmountable lead the Yankees enjoyed practically throughout the entire campaign and it cannot be doubted that Babe Ruth and his "home run bat" were responsible for this huge attendance figure. During the year Ruth signed a new three-year contract with the Yankees which called for an annual salary of \$70,000, the highest ever paid a ball player. It was understood he at first demanded \$100,000.

The statistics of the world series follow:

First game, Yankees, 5 runs, 6 hits, 1 error; Pirates, 4 runs, 9 hits, 2 errors. Batteries, Hoyt, Moore and Collins; Kremer, Miljus and Smith.

Second game, Yankees, 6 runs, 11 hits, 2 errors; Pirates, 2 runs, 7 hits, 3 errors. Batteries, Pipgras and Bengough, Aldridge, Ovingros, Dawson and Gooch.

Third game, Yankees, 8 runs, 9 hits, no errors; Pirates, 1 run, 3 hits, 1 error. Batteries, Pennock and Grabowski, Bengough; Meadows, Ovingros and Gooch, Spencer.

Fourth game, Yankees, 4 runs, 12 hits, 2 errors; Pirates, 3 runs, 10 hits, 1 error. Batteries, Moore and Collins; Hill, Miljus and Smith, Gooch.

Byron Bancroft Johnson, founder of the American League and president of the organization since its inception, departed from the baseball arena during 1927. The charges that Tyrus Cobb and Tristram Speaker, two veteran and highly esteemed players, had bet on the outcome of a game several years ago led to the passing of Johnson. While Judge Kenesaw Mountain Landis, High Commissioner of Baseball, was investigating these charges President Johnson issued a statement bitterly attacking Landis for the manner in which the latter was handling the case and demanding a "showdown." The climax came when at a session of the league in Chicago in January Landis was absolved of all blame and Johnson censured and ordered to take an indefinite leave of absence. Johnson suddenly reap-

peared in his Chicago offices in April and again took charge of league affairs but on July 8 at the demand of the league directors he tendered his resignation to take effect the following November. Later E. S. Barnard, then president of the Cleveland Club, was chosen head of the American League. Cobb and Speaker in the meanwhile had been exonerated by Commissioner Landis and declared free agents. Speaker eventually signed with the Washington Senators and Cobb with the Philadelphia Athletics, both at large salaries.

Harry Heilmann of the Detroit Tigers was the leading batter of the year in the American League with an average of .398 while Paul Waner of the Pittsburgh Pirates captured the hitting laurels in the National League with .390. Waner also was voted the most valuable player in his league, Lou Gehrig of the New York Yankees gaining the same distinction in the American League. The most effective pitcher in the National League proved to be Ray Kremer of the Pittsburgh Pirates. In the American League this honor fell to Wilcy Moore of the New York Yankees.

The final standing of the National League was as follows:

Pittsburgh won 94, lost 60; St. Louis won 92, lost 61; New York won 92, lost 62; Chicago won 85, lost 68; Cincinnati won 75, lost 78; Brooklyn won 65, lost 88; Boston won 60, lost 94; Philadelphia won 51, lost 103.

The final standing of the American League follows:

New York won 110, lost 44; Philadelphia won 91, lost 63; Washington won 85, lost 69; Detroit won 82, lost 71; Chicago won 70, lost 83; Cleveland won 66, lost 87; St. Louis won 59 lost 94; Boston won 51, lost 103.

The pennant winners in the more important minor leagues were: International, Buffalo; American Association, Toledo; Pacific Coast, Oakland; Southern, New Orleans; Western, Tulsa; Eastern, Albany; Three I, Danville; New England, Portland; South Atlantic, Greenville.

Among well-known baseball men who died during 1927 were William Gilbert, former second baseman of the New York Giants, Walter Keeley, once shortstop of the Brooklyn Robins, Michael Lynch, old-time National League pitcher, Lave Cross, former Philadelphia Athletics' third baseman and James E. Johnstone, former big league umpire.

Among the stronger college nines in 1927 were Pennsylvania, Holy Cross, Fordham, Harvard and Georgetown.

BASKETBALL. The ever increasing popularity of basketball was attested in 1927 by the opening of the Palestra of the University of Pennsylvania with seating facilities for 10,000. A capacity crowd witnessed the opening game there between Yale and Pennsylvania and it was estimated that more than 100,000 persons witnessed the matches played in the Palestra during the season. Other colleges will be forced to afford more seating space if the large numbers this sport was attracting were to be accommodated.

The championship of the Eastern Intercollegiate League was won by Dartmouth after a play-off with the Princeton quintet. These teams finished the regular season with seven victories and three defeats each and met in the Palestra for the deciding contest which went to Dartmouth by a score of 26 to 24. Pennsylvania and

Columbia were tied for third place in the final league standing, each having won five games and lost five.

Michigan captured the laurels in the Western Conference with ten victories and two defeats. Indiana and Purdue were tied for second honors with nine triumphs and three reverses each. Vanderbilt won the Southern Conference title while California was the victor in the Pacific Coast conference.

The Hillyards of St. Joseph, Mo., for the second year in succession won the national Amateur Athletic Union championship in the tournament held at Kansas City, Mo. In the final game the Hillyards defeated the Ke-Nash-A five of Kenosha, Wis., by a score of 29 to 10. A crowd of 10,000 spectators saw the contest.

BASKET MAKING. See ANTHROPOLOGY, under *New World Ethnography*.

BATES COLLEGE. A non-sectarian coeducational college at Lewiston, Me.; founded in 1864. For the first semester of 1927 there were 620 students, 359 of whom were men and 261 women; in the summer session there was a total of 229, of whom 96 were men. The faculty and administrative officers numbered 48. The year 1926-27 witnessed alterations to the Chemical Laboratory and Libbey Forum, resulting in a considerable extension of recitation room facilities. Honors courses were further developed, sectioning according to ability was tried, and several curriculum revision committees got under way. The permanent funds of the College amounted to \$1,750,000; total expenditures for 1926-27 were \$232,682, and the budget for 1927-28 involved an appropriation of \$278,207. The library contained 55,000 volumes. President, Clifton Daggett Gray, Ph.D., LL.D.

BAUXITE. In 1926 the bauxite output of the United States was 392,250 long tons, valued at \$2,415,200, or an increase of 24 per cent in quantity and 21 per cent in value, as compared with 1925. The imports of bauxite in 1926 aggregated 281,644 long tons, valued at \$1,187,497, or a decrease of 20 per cent in quantity, as compared with 1925. Bauxite, which enters largely into the manufacturing of aluminum, was produced in the United States principally in Arkansas, where the production in 1926 was 371,570 long tons, valued at \$2,298,550, Georgia and Tennessee supplying 20,068 tons valued at \$116,650. The principal sources of bauxite outside of the United States were France, British Guiana, Italy and Dutch Guiana. See also ALUMINUM.

BAVARIA. A constituent state of the German Republic; formerly a kingdom within the German Empire, ruled for more than a century by the Wittelsbach dynasty, which was deposed after the revolution following the World War. The new state adopted a republican form of government on Nov. 22, 1918. Area 29,334 square miles; population, according to the census of 1919, 7,140,340; according to the census of 1925, 7,379,594. Chief cities: Munich, with a population of 680,704 in 1925; Nuremberg, 392,494; Augsburg, 165,522; Ludwigshafen, 101,869. In 1925 there were 52,900 marriages; 142,683 living births; 3739 still births; and 99,472 deaths. The religious division of the population of Dec. 1, 1925, was: Roman Catholics, 5,164,

786; Protestants, 2,110,327; Jews, 49,163. Education is compulsory between the ages of six and 16. In 1925 the chief crops with their areas and yields were as follows: Wheat 617,527 acres, 413,568 metric tons; rye, 1,020,771 acres, 594,493 tons; oats, 1,075,383 acres, 461,018 tons; potatoes, 939,159 acres, 4,913,362 tons; vines, 50,709 acres, 7,752,096 gallons; hops, 26,723 acres, 3879 tons. The census of livestock in the same year showed 411,368 horses, 3,534,391 cattle, 489,980 sheep, 1,736,314 pigs, and 450,810 goats. In 1925 the output of coal was 2,203,532 metric tons; of iron ore, 514,931 tons; pig iron, 244,725 tons; cast iron ware, 191,507 tons; sulphuric acid, 309,185 tons.

The constitution dates from Aug. 14, 1919. Under it, the supreme power is vested in the people, who are represented by a diet of one chamber elected for four years on a basis of universal, equal, direct, secret, and proportional suffrage, all citizens over 21 years of age having the right to vote. There is one representative for every 82,000 inhabitants, making a legislature of 129 members. The various parties represented in the Bavarian National Constituent Assembly (elected April and May, 1924) were as follows: Baravian People's party, 46; Social Democrats, 24; Völkischer Bloc, 14; National Socialists, 6; German Nationals and National Liberals, 14; Bavarian Peasants' and Middle-Class Union, 12; Communists, 7; others, 8. The cabinet as constituted in 1927 was as follows: Premier and Minister of Foreign Affairs, Dr. Held; Education, Herr Goldenberger; Commerce and Industry, Dr. von Meinel; Social Welfare, Herr Oswald; Agriculture, Professor Fehr; Interior, Herr Stuetzel; Finance, Dr. Krausneck; Justice, Herr Gürtner.

BAXTER, SYLVESTER. American publicist, died at San Juan, Porto Rico, January 28. He was born at West Yarmouth, Mass., Feb. 6, 1850, of Pilgrim ancestry, and was educated at Leipzig and Berlin. His early life was spent on various Boston newspapers and as a foreign correspondent, being a special correspondent for the *Boston Advertiser* in Germany, 1875-77, and of the *Boston Herald* and *New York Sun* in Mexico, 1883-84, when he was editor of the *Mexican Financier*. From 1885 to 1886 he was editor of *Outing*, and he was a correspondent for the *Outlook* in South America. He was interested in the development of the Boston municipal park system, and was said to be the first to suggest the organization of Greater Boston, and of the Boston Metropolitan Park System. He was secretary of the Boston Metropolitan Improvements Committee, 1907-09, and at one time was chairman of the Malden Park Commission. His writings include: *Cruise of a Land Yacht*; *Berlin, A Study in Municipal Government* (1890); *The Boston Park Guide*; *The Old New World, Statement of the Hemmaway Southwestern Archaeological Expedition* (1888); *Greater Boston* (monograph) (1891); *Spanish Colonial Architecture in Mexico* (1902); *the Quest of the Holy Grail* (1904); *Old Marblehead* (1906); *The Unseen House* (poems) (1917); also numerous articles relating to civic improvement and economics, and architecture and other arts.

BEARSTED, VISCOUNT (MARCUS SAMUEL). British developer of oil fields, died at London, January 17. He was born Nov. 5, 1853, the second son of Marcus Samuel, and was educated privately. He traveled extensively in the Far East

in connection with his business. This, beginning with painted shells, grew to include curios, general produce and rice. While in Japan he became interested in the petroleum industry. He started the shipment of oil from Russia, originating the practice of cleaning the hulls of the vessels to permit their return to Europe filled with rice and other Eastern products. The business was developed through the financial support of the Rothschilds, and Samuel was also closely associated with the Japanese Government in the development of trade, his firm being entrusted with the issue of the first Japanese gold loan of £4,500,000. In 1897 he established the Shell Transport and Trading Company, with a capital of £1,800,000, the name being taken from the original business in shells. At the time of his death the issued capital of this company was nearly £26,500,000. The amalgamation of the Royal Dutch Petroleum Company and the Shell Company occurred in 1907, and an enormous oil producing, refining, and distributing organization was developed. In 1898 Samuel was knighted for services rendered in the salvage of H.M.S. *Victorious*. Previously he had been Alderman of the City of London, serving from 1891-1902, and Sheriff 1894-95. He was Lord Mayor of London 1902-03, and was created a baronet in the latter year. In 1921 he was created a baron and in 1925 first Viscount Bearsted of Maidstone. He received an official vote of thanks from the Lord Commissioner of the Admiralty in May, 1915, for "services of the utmost importance to the fighting forces at the present time." Viscount Bearsted included among his honors that of Commander of the Order of Leopold of Belgium; Grand Officer of the Legion of Honor; Freeman of the city of Sheffield and of the town of Maidstone; Knight Commander of the Order of the Rising Sun of Japan, and Second Class, Sacred Treasure of Japan.

BEAUX-ARTS INSTITUTE OF DESIGN.

A school of fine arts in New York City, planned after the *École des Beaux-Arts* in Paris; organized in 1916 by the Society of Beaux-Arts Architects, for the purpose of furnishing "instruction in the Arts of Science at a minimum cost to students, to bring art students under the criticism of artists who are engaged in active practice, to carry students beyond the academic study of the arts into the province of their application and practice, and to bring about co-operation among the various arts schools of the country." The Institute maintains a school of sculpture at its headquarters, in which the instructors are sculptors of high standing, who volunteer their services, each serving a term of three months in the life classes, while the instructors in architectural ornament serve for one month or the duration of the treatment of the style which is the subject of the study scheduled. A department of architecture is also conducted for the purpose of furnishing a systematic training in architectural design for draughtsmen in offices and for students of architecture in general. Prizes in architecture, sculpture, decoration and mural painting are offered to students throughout the United States. Working under the auspices of the Institute in 1926-27 there were 1602 architectural students, 209 students of sculpture, 131 in mural painting, and 68 in interior decoration. Except in the case of the Paris Prize competitions there are no restrictions as to the nationality or age of entrants.

The courses offered in the department of sculpture include: Life modeling and architectural sculpture; architectural ornament; life drawing; antique modeling; composition; a sketch class; and various special courses. During the year 1927-28 the committee on education in the department of architecture conducted twenty-eight competitions for the study of architecture and six for the study of archaeology, in addition to the three competitions for the Paris Prize. Various prizes and scholarships were offered to its students through the Institute, the most important being: The Paris Prize for \$3600, given by the Society of Beaux-Arts Architects for two and one-half years' study in architecture at the École des Beaux-Arts in Paris, (all the competitors, including the winner, in the final competition to receive \$100 each, provided their work is considered satisfactory); and a scholarship of \$1,200, for one year's study in Paris in sculpture.

The Institute issues a monthly *Bulletin* in which are published the results of all contests, with the reproductions of the best designs submitted. Officers elected at the annual meeting in November, 1927, were: Director, Whitney Warren; director of architectural department, Edward S. Hewitt; department of sculpture, Edward McCartan; decoration and mural painting, J. Monroe Hewlett; chairman of the board of trustees, Benjamin W. Morris; vice-chairman, William Adams Delano. Headquarters are at 126 East 75th Street, New York.

BELGIUM. A kingdom of western Europe, situated between France and the Netherlands. Capital, Brussels.

AREA, POPULATION, ETC. The total area, including the districts of Eupen and Malmédy, which were ceded to Belgium after the Treaty of Versailles, is 11,755 square miles. The population, according to the official census of 1920, was 7,465,782; estimated, Dec. 31, 1926, 7,874,601, which represented a density of 669 per square mile. The chief cities with their population as of Dec. 31, 1925, are: Brussels (with suburbs), 801,656; Antwerp, 300,026; Liège, 168,562; Ghent, 163,364. The movement of population in 1925 was: Births, 154,288; deaths, 102,179; marriages 174,761. The emigrants in 1925 numbered 35,271 and the immigrants, 46,920.

EDUCATION. In 1926 there were 8329 primary schools, with 795,285 pupils; 3598 infant schools with 243,845 pupils; and 2286 adult schools with 67,487 pupils; all of these three classes of schools were for elementary instruction. There were also six normal schools for training secondary school teachers and 81 for training elementary school teachers (11,876 students). For higher education there are various agricultural, technical, normal and art institutions. For collegiate education there are four universities, viz. the state universities at Ghent (1624 students in 1925-26) and Liège (2409 students) and the free universities at Louvain (3291 students) and Brussels (1637 students). A fifth university

was created in 1923 when the colonial school at Antwerp and the School of Tropical Medicine were united to form the Colonial University.

PRODUCTION, MINERAL RESOURCES, ETC. Of the total area in 1920, 2,945,104 hectares, 1,340,415 are under cultivation, 519,781 under forest, 107,977 fallow or uncultivated, the rest roads, marshes, rivers, etc. The accompanying table from *The Statesman's Year Book* for 1927 shows the acreage and yield of the principal crops for 1925:

Crop	Acreage	Produce in cwt.
Wheat	368,757	7,880,164
Barley	79,719	1,813,574
Oats	661,586	12,888,280
Rye	577,816	11,026,496
Potatoes	899,515	3,100,870
Beet (sugar)	180,204	2,167,594
Tobacco	8,095	153,540

* Tons.

For further details with respect to agriculture see article on *AGRICULTURE, Table of Production by Countries*. On Jan. 1, 1926, there were 250,024 horses, 1,654,767 horned cattle, and 1,161,719 pigs. The most important industries in Belgium are artificial silk, motor cars, glass, iron and steel, lace, linen, and gloves.

Mineral production has always been an important industry in Belgium. The country has natural resources of coal and zinc and after the economic union with Luxemburg in 1922 gained ready access to iron ore. No later general statistics for mineral resources are available than those published in the preceding *YEAR BOOK*. The U. S. Bureau of Foreign and Domestic Commerce reported a consumption of 32,783,000 metric tons of coal in Belgium during 1926. This estimate was based on a supply of 38,410,000 tons, made up of 1,558,000 tons in stocks Jan. 1, 1926, and extraction of 25,681,000 during the year, and imports totaling 11,271,000 tons. Despite the heavy consumption of coal in Belgium and Luxemburg, the Belgian coal mines are far from prosperous. French, German, and British producers are able to land coal in Belgium at prices under Belgian quotations. As a result, the situation of the Belgian mines in 1926 was only fairly satisfactory even with the British coal strike, which resulted favorably on the Belgian situation and permitted reduction of stocks at mine heads from over 1,500,000 to 169,000 tons. The fundamental difficulty with the Belgian coal industry appears to be the low production per workman, which in turn is traceable to the poverty and uneven nature of the coal strata.

COMMERCE. Because of the great fluctuation of the value of the Belgian franc during 1926 a truer picture of the country's foreign trade during that period is gained by following the trade through respective quarters of the year, in conjunction with the successive stages in the stabilization of the franc, rather than by considering the trade only in its total import of 34,377,000 metric tons valued at 23,000,226,000 francs and its total export of 23,163,000 tons valued at 19,500,942,000 francs. In such a consideration, the first quarter may be described as the period of attempted stabilization, the second quarter as the period of devalorization, the third as the period of reorganization, and the fourth as the period of attained stabilization.

In the first quarter of 1926 the value of exports was only 73.9 per cent of that of imports. The average value of imports was 56 centimes per kilo and that of exports was 72 centimes per kilo. During the second quarter there was a heavy increase in imports and a considerable one in exports. The larger increase in imports and the change in the value of the franc, which drove the average value of imports up to 69 centimes per kilo while the value of exports was stationary at 72 centimes, resulted in a higher unfavorable trade balance, with exports worth only 65.8 per cent of imports. In the third quarter imports declined slightly in value and volume, while exports showed a very considerable increase under both headings. During this period the average value of imports fell to 69 centimes per kilo, while the value of exports went up 14 points to 86 centimes per kilo. Exports thus amounted to 93.7 per cent of imports, and thus resulted in a greatly improved position of the trade balance. In the fourth quarter, with stabilization an accomplished fact, a very different picture, with an entirely new one in Belgian foreign trade, was shown. Values, especially of exports, increased greatly, jumping by 15 points to 101 centimes per kilo; though the heavier volume of trade related principally to imports, their value only advanced slightly to 72 centimes per kilo. This gave Belgium a favorable trade balance for the first time in its history, the exports for the quarter equaling 102.5 per cent of the imports.

BELGIAN FOREIGN TRADE FOR 1926

[Quantity in 1,000 metric tons; value in 1,000 francs]

Imports	Quantity	Value
Live animals and animal products	369.9	3,150,324
Vegetable products	3,546.2	7,223,658
Mineral products	26,376.9	4,642,167
Prepared foods, drinks, and tobacco	379.2	975,843
Chemical and pharmaceutical products	655.9	775,448
Oils and greases	4.9	30,016
Leather and pelts, and manufactures thereof	2.8	240,051
Textiles	37.5	1,309,968
Clothing, all sorts	8.2	159,710
Wood and manufactures thereof	1,674.8	858,378
Rubber and manufactures thereof	4.1	138,427
Paper and manufactures thereof	206.2	478,344
Quarry products and ceramics	216.0	117,662
Glass and manufactures thereof	29.4	47,883
Metallurgical products	738.7	1,321,740
Machinery, all kinds, and railway supplies	89.7	934,149
Vehicles, except railway	27.6	299,282
Watches, clocks, and instruments	.6	48,689
Musical instruments	.9	84,582
Arms	.2	7,074
Other	7.6	206,981
Total quantity	34,376.8	
Total value	23,000.2	23,000,226

Exports	Quantity	Value
Live animals and animal products	168.4	2,041,607
Vegetable products	728.7	1,236,941
Mineral products	13,458.0	1,751,390
Prepared foods, drinks, and tobacco	343.1	689,681
Chemical and pharmaceutical products	1,602.5	803,738

BELGIAN FOREIGN TRADE FOR 1926—Continued			
Exports	Quantity	Value	
Musical instruments	.2	4,968	
Arms	1.5	97,083	
Other	33.5	295,232	
Total quantity	23,163.3		
Total value		19,500,942	

FINANCE. The budget estimates for 1926 and 1927 were as follows:

	1926 Francs	1927 Francs
Revenue	9,162,905,783	9,578,381,871
Expenditure	10,020,858,376	7,915,095,644

The principal items of the ordinary estimates for two years are shown as follows (in thousands of francs):—

Revenue	1925 1,000 Francs	1926 1,000 Francs
Direct taxes	1,240,500	1,798,000
Indirect taxes	1,056,800	1,071,410
Stamp duties	1,243,152	1,461,150
Miscellaneous	319,901	498,403
Expenditure		
Public debt	2,543,010	3,887,763
National defense	622,987	567,943
Finance	218,960	185,748
Public works	107,476	104,018
Education	430,188	420,275

On Jan. 1, 1926, the Belgian public debt amounted to 47,010,007,509 francs. On Oct. 25, 1926, a debt of £20,000,000 was contracted for thirty years for the purpose of stabilizing the franc.

COMMUNICATIONS. On Jan. 1, 1926, the Belgian merchant fleet was composed of 156 ships of 342,148 tons. The number of vessels entering Belgian ports in 1925 was 15,208 of 23,575,091 tons; cleared, 15,214 of 23,599,482 tons.

The Belgian State Railways were transformed into a private company—the Société Nationale des Chemins de Fer Belges—by law of July 23, 1926, and the statutes of the new company were approved by royal decree of Aug. 7, 1926. The duration of the company is 75 years, dating from Aug. 1, 1927. The capital of the company is fixed at 11,000,000,000 francs, represented by 20,000,000 preferred shares of 500 francs each and 10,000,000 common shares of 100 francs each. The government turned over to the company the rights of exploitation of all the lines previously exploited by the state. These rights include the use of the railways and their dependencies and buildings, with the exception of such buildings as are needed by the ministry of railroads, of repair shops, all fixed and rolling stock, tools and equipment of the shops, stations, warehouses, offices, merchandise, leases and contracts, etc. The Société Nationale des Chemins de Fer, at the close of 1926, operated 4809 kilometers of railroad lines, with a total trackage amounting to 13,197 kilometers, including double track, sidings, and branches. Only 300 kilometers of normal-gauge lines were operated in Belgium by other companies, and the Société can, therefore, be considered as practically monopolizing the Belgian rail transport system.

Operating receipts in 1926 amounted to 2,194,903,000 francs, and expenditures amounted to

1,803,999,000 francs. The rolling stock at the end of the year consisted of 3191 locomotives, 116,606 freight cars, and about 8500 passenger cars. It was too early to make comparisons between the financial results of operation of the railroads as a private company and as a state-owned monopoly. However, preliminary figures indicate that profits for the first ten months of exploitation under the new company (September, 1926, to June, 1927) amounted to 422,000,000 francs, after deduction of 25,000,000 francs each month (since January, 1927) for the constitution of a fund for the purchase of new equipment, whereas the profits for the corresponding period of 1925-26 under government exploitation amounted to only 107,000,000 francs.

GOVERNMENT. Belgium is a constitutional, representative, and hereditary monarchy. Executive power is in the king, acting through a responsible ministry; legislative power is in the king and two chambers, namely the senate and house of representatives. The former is elected partly by the direct and partly by the indirect vote of the people, the number being equal to half the number of members of the lower house and proportioned to the population of each province. Those elected indirectly are chosen by the provincial councils. The 186 members of the lower house are elected by universal suffrage directly, for four years. The reigning monarch in 1927 was Albert, who succeeded his uncle, Leopold II, Dec. 17, 1909. The cabinet as appointed May 20, 1926, was composed as follows: Prime Minister and Minister of Interior and Health, Henri Jaspar (Catholic); Foreign Affairs, Emile Vandervelde (Socialist); without portfolio, Emile Francqui; Justice, Paul Hymans; Education, Camille Huysmans; Finance and Colonies, Baron Houtart; Agriculture and Public Works, Henri Baelis; Industry and Labor and Social Insurance, Joseph Wauters; Railways, Marine, Posts and Telegraphs, and Aeronautics, Edouard Anseele; National Defense, Comte de Broqueville.

HISTORY

ONE YEAR OF STABILIZATION. Looking back over the twelve month period since October, 1926, when the Belgian franc was legally stabilized, a striking picture of progress in the various branches of economic life in Belgium was presented. While there was perhaps some room for debate as to the extent to which the monetary reform has contributed to the satisfactory situation at the end of 1927, and, although in the light of later events, some contended that a higher rate could have been adopted, it was evident that the public in general was satisfied with all aspects of the stabilization plan and its workings. That it had been a pronounced success thus far was beyond question. Belgium at the end of 1927 was in a far better position than at the beginning of the year and might face the immediate future with confidence.

According to M. Louis Franck, director general of the Banque Nationale, who administered the stabilization plan since it was conceived and put into operation by M. Emile Francqui, the minister without portfolio (see the preceding **YEAR BOOK**), the benefits of the monetary reform were seen in all divisions of Belgian economic life. The speculative element in business, resulting from exchange fluctuations had ceased, exports had been maintained, the cost of living,

though higher, was less than in other countries where social conditions were comparable, wages had not been cut, and the enhanced value of Belgian securities represented billions of francs in profits. Moreover, deposits in Belgian savings banks had increased largely. Since stabilization became effective it had not been necessary to support the franc in any way, either at home or in the exchange markets of the world; the fluctuations in its value had been solely between the gold points, and on numerous occasions the belga had been quoted above par.

One of the earliest and most urgent measures of the stabilization programme was the consolidation or liquidation of the floating debt. This was partially accomplished by the conversion of internal short-term treasury notes into railway stock, following the organization of an autonomous company to operate the state railways. It was further provided that 1,500,000,000 francs should be set aside each year toward the liquidation of the short-term obligations, which on June 1, 1926, amounted to 15,387,000,000 francs. It was announced late in 1927 that by January, 1928, the short-term indebtedness would be reduced to 3,978,000,000 francs, of which 2,000,000,000 francs were due the Banque Nationale. The debt situation had been eased to such an extent that reduction of annual contribution to the amortization fund to 1,200,000,000 francs was being contemplated, the remaining 300,000,000 francs to be used in tax reduction. There was, however, in conservative circles, a feeling that the larger payments should be continued until the short-term debt was completely liquidated, as the country seemed able to support the prevalent rates of taxation.

The reassuring effect of stabilization on the mass of the people was most strikingly illustrated by the increase of State-guaranteed savings accounts. During the period of inflation and currency depreciation preceding legal stabilization there was a tendency to spend money as fast as earned, for fear that it would decline still further in buying value, but with a guaranteed currency the normal habits of thrift were resumed. In October, 1926, the guaranteed savings accounts amounted to 2,600,000,000 francs, and by September, 1927, the sum had grown to 3,270,000,000 francs, in spite of a slow but more or less continuous rise in the cost of living. The number of operations under the government postal-check system increased over the same period from 17,400,000 to 19,325,000, with a corresponding increase in the amounts that were involved.

As a natural result of the plenitude of money seeking employment, the stock exchange was extremely active. There was, however, an element of danger in the situation, owing to widespread speculation by persons in moderate or poor circumstances. All classes of securities moved upward in general values during the year, and some reached fantastic heights. Domestic industrial shares received the least support, but bank stocks, foreign tramway and electrical enterprises, and particularly colonial developments, skyrocketed. The interest in these securities was based, not on present returns, but on past earnings that had accumulated very large reserves, and on future prospects. Any serious setback to colonial shares would be disastrous, for it would perhaps retard the legitimate flow of capital into colonial development, with which

the future prosperity of Belgium is so closely linked.

Fears of a crushing increase in living charges and production costs, following stabilization, proved groundless. While there had been gradual increases in the retail price index, they had not been at all dangerous. Retail prices still remained well below the world level and in some respects even below pre-war prices on a carefully weighted gold basis. The wholesale price index had fallen. In October, 1926, the retail index stood at 705 on a paper basis and 102 on a gold basis, and at the end of 12 months it had risen to 794 and 115, respectively. The wholesale index, on the other hand, which stood at 856 and 123, had fallen to 837 and 120.8. During the first year of stabilization Belgian industries as a whole had either improved or held their positions; coal alone had gone backwards. Unemployment maintained its remarkably low average, the proportion of total unemployment varying between 2 and 3 per cent, according to seasonal activities in certain trades.

EUPEN AND MALMEY. The question of the affection of these districts for Belgium was brought up time and again during the year. The two areas had been ceded to Belgium after a plebiscite held in accordance with the Treaty of Versailles. The Socialist element has been insistent in its demand for a new plebiscite on the grounds that the people had been denied the right to express their real minds in the matter. In answer to the demand of a Socialist deputy representing these districts, Prime Minister Jaspar stated that no new plebiscite would be held and furthermore accused German propaganda of being the primary cause for the unrest there. Other deputies in reply to the demand of the Socialists insisted that the government take stringent steps to eradicate the German propaganda agencies in the territories.

CABINET CHANGES. Throughout the year there had been a grave discussion over the question of the strength and duration of service of the armed forces of the country. The Socialists had been insistent in their demand for a reduction in the length of military service to six months instead of the prevailing service which in some cases ran to thirteen months. The King and the cabinet had been firm opponents of the reduction measure, and from time to time brought up the old German bogey and bemoaned the fact that their eastern frontiers were woefully weak and in case of another attack such as that of 1914 the country would be more easily overrun. The Socialists under the leadership of M. Vandervelde, the Foreign Minister, took the point of view that a reduction was not only right but more economical and in accordance with the stringent financial plans of the government. The clash resulted in the resignation of the Jaspar cabinet, composed of a coalition of Catholics, Socialists, and Liberals, which was formed in 1926 to fight "the battle of the franc." The Jaspar group fell on November 21 because of inability of the Socialists to agree with the other members on the question of military policy. On the next day Premier Jaspar formed a new cabinet, also a coalition, which based its strength on the grouping of the Catholic Liberals, and Christian Democrats, thus substituting the last named party for the former Socialist group. M. Vandervelde was replaced by Paul Hymans, who was as well known

internationally as a strong supporter of the League of Nations as M. Vandervelde himself. The new cabinet stated that it would turn the question of military service over to a committee formed from parliamentary and military experts, with express orders to let their decision be based upon the tenets of "security."

BELL, CARL. American sculptor, died at Chicago, Ill., June 18. He was born in Germany in 1858, and was a graduate of the Academy of Fine Arts in Munich. Previous to his going to the United States he did work for King Ludwig of Bavaria, superintending the building of castles in the Bavarian Alps. First settling in New York, he later went to Chicago to direct the sculpture for the Chicago Exposition of 1893, and at its conclusion established himself in that city. He was director of sculpture for the Buffalo and St. Louis fairs, and was also interested in the Paris Exposition of 1900.

BENJAMIN, GEORGE HILLARD. American engineer and chemist, died at New York, N. Y., November 10. He was born at New York, Dec. 25, 1852, and graduated from Union College in the class of 1872, later taking the degree of M.D. at Albany Medical College in 1874. He studied in France and Germany, receiving the degree of Ph.D. in 1882 from the University of Freiburg. He practiced medicine and studied law, being admitted to the bar in 1884. He was editor of several works of reference in the field of applied mechanics, and became a consulting engineer and patent expert, serving many large manufacturing and electrical corporations. As one time he was the American representative of the Siemens-Halske Company of Germany. During the World War he developed sound-detecting devices for protection of vessels against submarines. He accumulated a large library of scientific and other books, and wrote much.

BENNINGTON, BATTLE OF. See CELEBRATIONS.

BENTON, GUY POTTER. American educator and religious worker, died at Minneapolis, Minn., June 29. He was born at Kenton, O., May 26, 1865, and after graduating from Baker University received the degree of A.M. from Ohio Wesleyan University; he also studied at the University of Wooster and at Berlin. Entering upon educational work, he became superintendent of schools at Fort Scott, Kan., in 1890, and in 1895 was made assistant state superintendent of public instruction for Kansas. In 1896 he became professor of history and sociology at Baker University, and in 1899 was elected president of Upper Iowa University, serving until 1902, when he was called to Miami University as president. In 1911 he was elected president of the University of Vermont, a position he held until 1919, and in 1921 he became chief educational consultant and president of the University of the Philippines, serving until 1924. During the World War he was abroad with the American Expeditionary Forces and became general secretary for the Y. M. C. A. for the City of Paris, September–November, 1917, and chief organizing secretary for the Y. M. C. A. with the American Expeditionary Forces, November, 1917, and June, 1919. He was chief secretary of the Eighth Region of the A. E. F. in 1919, and a member of the United States Army Educational Corps and chief educational director of the American Army of Occupation, with headquarters at Coblenz, Germany. After

his discharge from the army in 1919 he was awarded the Distinguished Service Medal for his war service. He published *The Real College* (1909).

BEREA COLLEGE. A non-sectarian, coeducational institution at Berea, Ky.; founded in 1855, and designed to serve the educational needs of the mountain people of the Southern Appalachian region. The enrollment for the autumn of 1927 was 1960, distributed as follows: college, 419; normal, 300; academy, 454; foundation-junior high school, 634; training school, 153. The enrollment in the summer session totaled 322, of which 145 were in the college, 100 in the normal school, and 77 in the academy. The faculty had 94 members, distributed as follows: college, 29; normal, 11; academy, 19; foundation-junior high school, 30; training school, 5. The endowment amounted to \$7,698,948.23 and the income for the year ending June, 1927, was \$329,597.07. The library contained 50,000 volumes. A new science building, a men's gymnasium and an animal husbandry building were under construction during the year. President, William J. Hutehins, D.D., LL.D.

BERMUDA. A British colony in the West Indies consisting of a group of small islands lying about 580 miles from Cape Hatteras, N. C. About 20 of the islands are inhabited. Because of its picturesqueness and proximity to New York (677 miles) it is a favorite winter resort for American tourists, who number annually some 28,000. Area, 19.3 square miles; population, according to the census of 1921, 20,127 (7006 white). The estimated civil population in 1925 was 27,741. Statistics for commerce and finance follow:

	1924	1925
Imports	£ 1,815,028	£ 1,825,041
Exports	446,252	166,020
Revenue	329,139	248,476
Expenditure	312,969	312,283

In 1925 the total tonnage of vessels entered and cleared was 2,749,780 tons of which 2,367,482 were British. The public debt in 1925 was \$45,000. The chief products are: Potatoes, onions, lily bulbs, and various vegetables. The chief imports in 1925 were: Provisions, beef, bran, clothing, cotton goods, electrical goods; flour; hardware; fuel oil; and woolen goods. The chief exports are: Potatoes; onions; other vegetables; bulbs, and whiskey. The administration is under a governor assisted by an executive council of seven members and a legislative council of nine members appointed by the king and an elected assembly of 36 members. Governor in 1927, Lieut.-Gen. Sir Louis Jean Bols.

BERNARD, THE MOST REV. AND RT. HON. JOHN HENRY. Provost of Trinity College, Dublin, died in Dublin, August 29. He was born in India, July 27, 1860, the son of a civil engineer practicing in that country, and was educated privately before entering Trinity College, Dublin, where he received the degree of M.A. in 1883. He became fellow and tutor in Trinity College the following year, and was ordained in 1886, serving as chaplain to the Lord Lieutenant of Ireland, 1886-1902. He served as King's lecturer in divinity at Dublin, 1888-1911, and was treasurer of St. Patrick's Cathedral, 1897-1902, and dean, 1902-11. He was Bishop of Ossory, Ferns and Leighlin, 1911-15, and was appointed Arch-

bishop of Dublin in 1915 on the resignation of Dr. Peacock. In 1919, on the death of Sir John Mahaffy, Dr. Bernard, who had been appointed vice chancellor of the university, was chosen by the Crown to succeed Mahaffy as Provost of Trinity. Under the régime of the Free State, Trinity College contributed to the national life and continued its standard of high scholarship. In addition to Dr. Bernard's administrative work, he was a scholar and preacher of force and reputation, and was frequently called to Oxford and Cambridge as select preacher. He was president of the Royal Irish Academy, 1916-21; warden of Alexandra College, Dublin, for the higher education of women, 1903-11; and had many Government and ecclesiastical honors including degrees from Oxford, Durham and Aberdeen. His publications, in addition to translations and editorial work, included: *From Faith to Faith, University Sermons* (1885); *Via Domini, Cathedral Sermons* (1898); *the Prayer of the Kingdom* (1904); *St. Patrick's Cathedral, a Handbook and a History* (1904); *Archbishop Benson in Ireland* (1896); (in conjunction with Professor Atkinson) *The Irish Liber Hymnorum*, (2 volumes) (1898); *The Pastoral Epistles of St. Paul* (1899); *The Second Epistle to the Corinthians* (1903); *The Works of Bishop Butler* (2 volumes) (1900); *The Psalter in Latin and English* (1911); *The Odes of Solomon* (1912); *Christmas Thoughts* (1913); *Verba Crucis* (1915); *Easter Hope* (1916); *Studia Sacra* (1917); and *In War Time* (1917).

BESABABIA. Formerly a government of the Russian Empire; joined to Rumania in March, 1918. See RUMANIA.

BEVERIDGE, ALBERT JEREMIAH. American statesman and historian, died at Indianapolis, Ind., April 27. He was born on a farm on the border of Adams and Highland Counties, Ohio, Oct. 6, 1862, the son of a farmer who was then, together with four half-brothers, serving in the Union Army in the Civil War. His boyhood was passed on the farm in humble circumstances, and he engaged in active work as a plowboy, railroad laborer and teamster. However, he was able to study and make his way through the local high school so that at 19 he entered Indiana-Asbury (later DePauw) University, where he worked his way through college. He graduated in 1885, but with impaired health and was forced to live in western Kansas and Colorado among the cowboys. During his college days he was successful as a declaimer and orator, and he was engaged as a political orator by Republican managers. On his return from ranch life he settled in Indiana, and read law in the office of Joseph E. McDonald, United States Senator. He was admitted to the bar in 1887, and his first case before a jury was with Benjamin Harrison, later elected President of the United States, as an opponent. He opened his own office in 1889, and soon won wide fame as an orator and as a lawyer. He devoted himself steadfastly to his practice, declining election or appointment to political office. In 1896 he delivered a speech at the Chicago Auditorium on the invitation of the Republican National Committee, in reply to one made in New York by John P. Altgeld. From this time on a number of his addresses, such as that on "The Vitality of the American Constitution," delivered before the Pittsburgh Bar Association in January, 1898, attracted widespread attention. In the last of these ad-

dressess, having to do with the war with Spain in which the United States was about to engage, he predicted its outcome and the activity of the United States in the Philippine archipelago. After this speech Beveridge was put forward as a candidate for Senator by an enthusiastic following of Republicans in Indiana, and he was sent to the United States Senate for two terms, 1899-1911. In the Senate he ranked high as an orator and in debate, and was considered a scholar of statesmanship by both friends and opponents. On Jan. 9, 1900, he made a speech, demanding that America retain the Philippines as a possession, which was hailed as a pronouncement of an American policy, and stimulated Americans to become interested in foreign affairs and in a broader outlook on national destiny. Mr. Beveridge as a result of his studies was a conservative constitutionalist, following in some measure, however, the policies of Roosevelt. He became leader of the Progressives during the Taft administration, failing on this account to be re-elected to the Senate for a third term. He was active in the Progressive party during the campaign of 1912, serving as chairman of the National Convention in Chicago which nominated Theodore Roosevelt. He was the Progressive candidate for Governor of Indiana, but was not elected, and in 1914 he was again defeated as the Progressive candidate for the United States Senate. In 1922, however, he became the regular Republican candidate for Senator, but was defeated by Samuel M. Ralston, his Democratic opponent. Beveridge, who was an earnest student not only of law but of history and economics, enjoyed a high reputation as an author and as a historian. He was a prolific writer, and among his many works his *Life of John Marshall*, the first two volumes of which were published in 1916 and the last two in 1919, was a scholarly production and a crowning effort, for which, in 1923, he was awarded the Roosevelt medal for a "valuable contribution to history." At the time of his death he was engaged on a biography of Abraham Lincoln along lines which had made his *John Marshall* so appreciated and successful. His various writings include: *The Russian Advance* (1903), a volume containing the impressions of his travels in Siberia and Asia (the conclusions of which, it might be said in passing, were seriously discredited by the Russo-Japanese War); *The Young Man and the World* (1905); *The Bible as Good Reading* (1906); *The Meaning of the Times* (1907); *Americans of To-day and To-morrow* (1908); *Work and Habits* (1908); *Pass Prosperity Around* (1912); *The Invisible Government* (1912); *What Is Back of the War* (1915); *The State and the Nation* (1924); and *The Art of Public Speaking* (1924). His *What Is Back of the War* was seriously criticized as pro-German in that he considered the struggle from a German point of view, and the volume was later barred from many libraries and training camps. Senator Beveridge was among the Republicans who strongly opposed the United States, joining the League of Nations and the World Court, and in many of his addresses he urged adherence to and the consideration of the fundamental ideas of the Constitution and the principles embodied therein. Even before his death it was thought that his reputation as a historian and an author, based largely on his *Life of John Marshall*, was greater than his fame as a statesman and an

orator. Senator Beveridge was honored with the degree of LL.D from DePauw University in 1902, from the University of Pennsylvania in 1920, from Lafayette College in 1921, and from Brown University in 1921.

BIBLE LANDS. See **ARCHAEOLOGY.**

BIBLE SOCIETY, AMERICAN. A society founded in 1816 which strives for a wider circulation of the Bible to all people, without denominational or racial discrimination. The Bibles are furnished at cost prices and distributed through the Society's home, foreign and other agencies. In 1926 home agencies distributed 3,060,081 volumes; the foreign agencies 5,705,290. The Society also supplied the Scriptures in 168 languages during the year, including editions in Roman and Gothic characters and embossed systems for the blind. The total issues of the Society in 111 years of service have been 184,028,960 volumes, of which 102,376,856 were distributed in the United States and 81,652,104 in foreign lands. The number of issues in the United States in 1926 was 4,352,703, of which 3182 were for the blind, and in other lands 5,554,658, making a total of 9,907,361. Workers in the 10 home agencies totaled 850, of whom 419 were volunteers; workers in the 12 foreign agencies numbered 2254, of whom 376 were volunteers. The work of revising and translating the Bible into additional languages was going on constantly and progress was reported to have been made during the year in translation and revision work in Yiddish, Spanish, Miskito, Cakchiquel, Quiché, Mam, Aymara, Peruvian Quechua, and Brazilian-Portuguese for the western hemisphere, Canton Colloquial for China, Samareño, Bicol, Tagalog, and Ilocano, for the Philippines, Siamese and Tai Yuan for Siam, and Olunoyore, Bulu, Luba-Lulua, and Shiluk, for Africa.

The total receipts of the Society for the year from invested funds, gifts, sale of books, etc., amounted to \$1,057,680.17; its expenses were \$1,067,049.81. The Society was affiliated with 97 auxiliary Bible societies throughout the United States, which assisted in the circulation of the Scriptures and contributed to its expenses. In 1926 the contributions received from this source amounted to \$22,937.97. The officers in 1926 were: E. Francis Hyde, President; the Rev. William I. Haven, LL.D., and the Rev. Arthur C. Ryan, General Secretaries; the Rev. Eric M. North, Ph.D., Associate Secretary; the Rev. Lewis B. Chamberlain, D.D., Recording Secretary; and Gilbert Darlington, Treasurer. The official organ of the Society is the *Bible Society Record*. Headquarters are at the Bible House, Astor Place, New York City.

BICYCLING. See **CYCLING.**

BILLIARDS. The advance in popularity of three-cushion billiards was the outstanding feature of 1927 in this sport. William Hoppe of 18.2 balkline fame announced that he had practically decided to devote his time henceforth to the angle variety of the game. Otto Reiselt successfully defended his three-cushion title three times during 1927, first against Angie Kieckhefer and later against Gus Copulos and Allen Hall as his challengers.

Four different players held the 18.2 balkline championship during the year. Eric Hagenlacher lost the title to William Hoppe and then Hoppe successfully defended his crown against Welker Gekhran in Boston only to have the latter

triumph in the national tournament held at Washington. Cochran retained the title in a match with Hagenlacher but lost it to Jake Schaefer in a three-day match played in New York City.

The pocket billiard championship was held by four players in 1927. Ralph Greenleaf, title holder at the opening of the year, bowed to Erwin Rudolph who in turn lost to Tommy Hueston. Hueston failed to defend the crown, surrendering it to Frank Taberski.

J. Howard Shoemaker regained the national amateur pocket billiard championship. John A. Clinton, Jr., successfully defended his national amateur 18.2 title while the amateur three-cushion honors went to E. H. Ruerk.

BINGHAM, AMELIA. American actress, died at New York City, September 1. She was born at Hicksville, Ohio, Mar. 20, 1869, the daughter of a hotel proprietor named Smiley. She studied at Ohio Wesleyan University, where she took part in amateur theatricals, but was not graduated, joining, on the advice of Lloyd Bingham, a traveling theatrical company which he managed. Her first professional stage part was played on the Pacific Coast, in a melodrama with McKee Rankin. She was married to Mr. Bingham, and in 1893 she made her New York debut at the People's Theatre in the Bowery, playing a leading rôle in the melodrama, "The Power of Gold." In such melodramas as "The Shaughran," "Colleen Bawn," "The Village Postmaster," and "Captain Impudence," she was a popular favorite. In 1897 she came under the management of Charles Frohman, appearing as the star of "The White Heather" and other productions, including "The Pink Domino," "The Proper Caper," "On and Off," "At the White Horse Tavern," "The Cuckoo," and "His Excellency, the Governor." In 1900, after appearing in "Hearts and Trumps," she determined to be her own manager, and opened at the Bijou Theatre on Jan. 15, 1901, in Clyde Fitch's "The Climbers." Other successes of this time were in "Lady Margaret," "The Modern Magdalen," and "The Frisky Mrs. Johnson." Between 1903 and 1909 she was the star of several successes, and also appeared in stock companies. In 1909 she was leading lady in "Big Moments from Great Plays" in England, and in 1913-14, with Douglas Fairbanks and William H. Crane, she played in "The New Henrietta" and a revival of "The Climbers." In the latter part of her life her activity was hampered more or less by illness. Her husband, Lloyd Bingham, died in Christiania, Norway, in 1915, while a member of the Henry Ford Peace Mission. Financial reverses forced her to return to the stage, and she played in "The Pearl of Great Price" in 1926, though in the previous year she had taken a part in the revival of Pinero's "Trelawny of the Walls." Mrs. Bingham was the first of the American women who were producer-managers, and for many years was one of the favorites of the American stage. She believed in upholding the better traditions of the drama, and deplored the decline of the stage.

BINGHAM, ROBERT. American educator, died at Asheville, N. C., May 8. He was born at Hillsboro, N. C., Sept. 5, 1838, and after studying at Bingham School entered the University of North Carolina, from which he graduated in 1857. He served through the Civil War, with the Army of Northern Virginia. From 1873 to 1920 he was superintendent of the Bingham School, which

had been founded in 1793 by his grandfather. He was a colonel in the North Carolina National Guard, and a director of the American National Bank and the Wachovia Loan and Trust Company. He was president of the North Carolina Historical and Literary Society, and Grand Master of the Freemasons of North Carolina, 1883-85.

BLACK, EBENEZER CHARLTON. Professor of English at Boston University, died at Cambridge, Mass., July 11. He was born in Liddesdale, Scotland, June 18, 1861, and graduated at Edinburgh University, where he received highest honors in rhetoric, Anglo-Saxon and English literature, and poetry. He was at Queens College, London; and Liddelbank, Liddesdale, 1884-91. In the latter year he became lecturer in English literature at Harvard University, Cambridge, Mass., serving until 1893, when he became principal of the language and literature department of the New England Conservatory of Music at Boston. This position he held until 1900, when he became professor of English literature at Boston University. He was also a lecturer in English literature at the Emerson College of Oratory, a member of the University Extension Commission, and honorary librarian of Boston University. He was a member of the Early English and Scottish Text Societies and of the Royal Society of Arts, and president of the New England Association of Teachers of English and of the Boston Drama League. His writings include: *Early Songs and Lyrics* (1888); *Shakespeare Manual for Teachers* (1915); *University Addresses* (1916); and *From a Professor's Notebook* (series) (1922). He was the editor of the *New Hudson Shakespeare*.

BLAISDELL, ALBERT FRANKLIN. American author and physician, died at Winchester, Mass., March 17. He was born at South Hampton, N. H., Aug. 31, 1847, and after graduating from Dartmouth College in 1869 took his medical degree at Harvard University in 1879. He was in practice at Providence, R. I., until he retired, spending the latter part of his life in writing. His publications include a number of text books and juveniles such as: *First Steps with American and British Authors* (1879); *Our Bodies and How We Live* (1884); *How to Keep Well* (1885); *Child's Book of Health* (1886); *Readings from the Waverley Novels* (1888); *Stories of the Civil War* (1890); *Stories from English History* (1897); *Practical Physiology* (1897); *The Story of American History* (1900); *Life and Health* (1902); *Hero Stories from American History* (1902), and *Short Stories from American History* (1905); *English History Story Book* (1910); *American History Story Book* (1911); *Child's Book of American History* (1913); *Heroic Deeds of American Sailors* (1915); *American History for Little Folks* (1917); *Pioneers of America* (1919); and *Log Cabin Days* (1921).

BLOCK SIGNALS. See **RAILWAYS; RAILWAY ACCIDENTS**.

BOHEMIA. A constituent member of the state of Czechoslovakia (q.v.) since the defeat of the Central Powers in 1918; formerly a crownland of Austria; situated in the northwestern part of the former Austro-Hungarian Empire, with Saxony and Silesia on the north, Moravia on the east, and Lower and Upper Austria on the south. Area, including the small Austrian and German territories which were added by the peace treaty to Czechoslovakia, 20,102 square miles; population, Feb. 15, 1921, 6,670,582. Bohemia is represented in the Czechoslovak legislature by nine deputies and five senators.

BOILERS. The trend toward larger boiler units and higher rates of forcing continued in 1927, apparently with the idea of keeping pace with the increased size of steam turbines and at the same time holding to a minimum the number of boilers per turbine. Several boilers, designed for outputs of 350,000 to 450,000 pounds of steam per hour were in service and had actually exceeded this evaporation, which was capable of supplying 40,000 to 50,000 kilowatts. A number of similar size units were on order at the end of the year as was also a boiler designed for an evaporation of 750,000 pounds of steam per hour. This last was to be installed in a large central heating plant. These high rates of evaporation had brought about revolutionary changes in furnace design during the last few years and had resulted in extensive use of water walls surrounding the furnace. Such walls, originally designed to reduce furnace maintenance through keeping down furnace temperatures, also form a very considerable portion of the heat-absorbing surface, especially the radiant heat.

However, furnace design was still in a state of evolution both as to proportions and as to type of walls. The fin-type and the refractory-faced water walls were both extensively used in large boilers, and air-cooled refractory walls were common with smaller units and those not forced to such high steaming rates.

A form of furnace that met with success during 1927, with pulverized coal, was what was called the "slagging" furnace. In this, a development of the well-type furnace, no attempt is made to cool the molten ash which is periodically drawn off from the bottom of the furnace. Water jets impinging on this molten stream break up the slag into small pieces which are sluiced away. With pulverized coal the aim has been to secure complete combustion and the greatest possible heat release per cubic foot of furnace volume by increasing the turbulence within the furnace. Modifications in burner design and placement were toward this end.

High combustion rates were accompanied by higher exit gas temperatures which were responsible for more extensive use of the air preheater. This not only increases the overall efficiency through recovery of waste heat but the hot air also promotes better combustion within the furnace. Air preheaters are used both with stokers and pulverized coal. Automatic combustion control continues to gain favor not only among central stations but also in many of the more important industrial power plants.

There was little change in the situation as regards steam temperatures and pressures during the year. With a few exceptions, principally abroad, the upper limit in steam temperature

remained at about 750° Fahrenheit, although research work continued, along metallurgical lines, with a view to producing alloy steels that would withstand higher temperatures for long periods without change in form or strength. Considerable progress was made but there had not been opportunity for conclusive long-time tests, such as yet to warrant the design of a station for operation at the higher temperatures. Moreover, the cost of the metals selected must not be such as to offset the gain secured through employment of the higher temperatures.

Following the lead of the Edgar Station of the Electric Illuminating Company of Boston with 1200-pounds and the Lakeside Station at Milwaukee with 1390 pounds, the Kansas City Power & Light Company announced its plans during the year for the installation of two 1400-pound units at its Northeast station. Also late in the year it was given out that a new station, to be built near Wilmington, Del., by the American Gas & Electric Company and the American Electric Power Corporation would probably employ 1200 pounds steam pressure. In the industrial plant field there was a boiler supplying process steam to a pulp and board mill in the South which operated at 1000 pounds pressure. No serious difficulties had been encountered in operating at these high pressures, as a result of which the Edgar Station had recently placed in operation two more high-pressure boilers serving a 10,000-kw. turbine. The 750-pound installation at the Solvay Process Company at Syracuse, reported in 1926 as under construction, was in successful operation. These high-pressure American installations were either operating or were soon to operate, on regular commercial loads.

In the intermediate range of 400 to 750 pounds a number of new installations were announced. One large boiler manufacturer reported 70 per cent of his orders for pressures between 300 and 450 pounds and 15 per cent between 450 and 750 pounds. These higher boiler pressures were not confined to central stations, as an appreciable number of industrial plants, taking advantage of the economies of high steam pressure and the development of the high-back-pressure turbine exhausting to process, had gone to such pressures in their new plants or in remodeling their old plants.

In Europe, notably Germany, there was also a marked trend toward relatively high steam pressures, especially in industrial plants. Many of these were operating at around 425 pounds. This was the outcome of the forged and welded drum construction being offered by several well-known Continental firms. Riveted drums were largely used up to 300 or 350 pounds above which the forged and welded drum was generally employed.

Several boiler installations had been operating for two or three years in Europe at pressures ranging from 650 to 1500 pounds. Some of these were covered in last year's review. They are the 1500-pound Löffler boiler in Moravia, the 1500-pound Sulzer unit at Winterthur, Switzerland, the 650-pound Luloff boiler at Amsterdam, the Schmidt boiler operating at 650 lbs. at Weringerade, the 868-pound Borsig boiler at Tegel, the 1500-pound Benson boiler at Siemensstadt and the Langerbrugge Station in Belgium operating at 750 pounds. With two or three exceptions, however, these are relatively small boilers operating under more or less experimental con-

ditions. The Siemens-Schuckert Works completed a larger Benson boiler, burning powdered coal and designed for an output of 86,000 pounds of steam per hour at 3200 pounds steam pressure. This steam is then throttled to 1500 pounds, in accordance with the Benson principle, and reheated to 750 degrees before being delivered to the turbine. A line on the explosion hazard at such high pressures was afforded by the bursting of two tubes on the smaller boiler. The rupture was accompanied by a hissing noise and the oil burner flame was extinguished. No serious damage resulted. This was because of the small tubes and the small body of hot water.

An operating condition brought about by high pressures and high rates of evaporation is the necessity for purer feed-water. This in many cases has resulted in the installation of evaporators for supplying make-up.

While the use of pulverized coal continued to extend, it by no means had the field to itself. Spurred on by the competition from pulverized coal and the demand for high rates of forcing boilers, stokers were being greatly improved during the last few years. Usually the choice between pulverized coal and stokers can be made only after weighing a number of local factors.

In the pulverized coal field the unit mill has made large gains. A recent survey was made by the Prime Movers Committee of the National Electric Light Association of 203 plants in which boilers of over 500 horse power were installed. Of these 80 were central stations and 123 industrial plants. The unit system in these installations outnumbered the centralized preparation and storage system by three to one. In the large number of pulverized coal installations on boilers under 500 horse power the unit system largely predominates. Coal preparation costs in the large plants usually fall close to 25 cents per ton, including power, labor and maintenance. Application of pulverized coal to marine service was made by the U. S. Shipping Board on the steamship *Mercer* which at the end of the year returned from a round trip to Europe and reported not only satisfactory results, but considerable savings in both fuel and labor.

MERCURY BOILER. Development of the mercury boiler by W. L. R. Emmet has proceeded over a period of years during which time a number of successive designs have been tried out at the Dutch Point Station of the Hartford Electric Light Co. The latest step has been the installation, during 1927, of a 10,000-kilowatt unit at the South Meadow Station of the same company, which was to operate on the regular commercial load. This latest unit would operate on pulverized coal.

Briefly, the equipment consists of a mercury boiler, a mercury vapor super-heater, a mercury economizer, an air-preheater, a mercury vapor turbine, a mercury condenser, which also serves as the steam boiler, and a steam super-heater. The mercury vapor is generated at a pressure of 70 pounds per square inch gauge and passes to the five-stage turbine from which it is exhausted at about one pound gauge to the condenser, or steam boiler. Here steam is generated at 350 pounds. The rated capacity of the steam boiler is 125,000 pounds of steam per hour, which goes into the existing steam mains of the station and is in addition to the 10,000 kilowatts generated by the mercury turbine. Unlike previous mercury boilers, the new unit is made up of

seven drums from each of which there projects downward a bank of 440, 2 $\frac{3}{4}$ -inch dead-end tubes. Within each of these tubes are two concentric tubes. The inner one is a circulating tube through which the mercury liquid flows down from the drum. Between this tube and the second, or filler tube, is a dead-air space serving as an insulating medium to prevent heat passing to the mercury on its downward course. Vaporization and upward circulation take place in the small annular space between the filler tube and the outer tube.

BOKHARA, bo-kä'rá. A state in Central Asia, formerly a dependency of the Russian Empire, later known as the Bokharan People's Republic, and since February, 1926, a part of the Soviet Socialist Republic of Uzbek. It is bounded on the north by the Russian provinces of Samarkand and Syr-Daria; on the south by Afghanistan; on the southwest by Transcaucasia and Khiva; and on the east by Ferghana. Estimated area, 79,000 square miles; estimated population, 3,000,000. The chief towns with their estimated populations are Bokhara, 75,000, and Karshi, 25,000. The religion is chiefly Mohammedan. The chief products of Bokhara are corn, fruit, silk, tobacco, cotton, hemp, and farm animals; and the chief minerals are gold, salt, alum, and sulphur. The trade is mainly with India to which raw silk is exported and from which tea, indigo, Dacca muslin, etc., are imported. By the revolution of Aug. 30, 1919, the Amir was dethroned and the Soviet government was set up, which formed a military and political agreement with Russia. In February, 1925, Bokhara and Khiva were joined together to form the Soviet Socialist Republic of Uzbek.

BOLIVIA. A South American republic situated in the interior and bounded by Brazil on the east and Chile on the west. Sucre is the seat of the supreme court and is historically regarded as the capital, but the actual seat of the government and the largest city is La Paz.

AREA AND POPULATION. Estimated figures for the area and population of Bolivia place the latter at 2,155,000, as against 1,796,500, the population shown by the last official census, taken in the latter part of 1900. The area of the republic is given as 1,332,808 square kilometers, or 506,467 square miles. In 1924 the estimated population of La Paz was 118,250. Other large towns with their estimated populations at the same time were; Cochabamba, 34,281; Potosi, 30,122; Sucre, 16,194; Tarija, 10,843; Oruro, 32,908; Santa Cruz, 18,315; and Trinidad, 6269.

EDUCATION. Elementary education which is free and compulsory, is under the care of the municipalities and the state. According to the report of the Minister of Public Instruction the school statistics for the year 1926 were as follows:

Type of instruction	Number of schools	Number of teachers	Number of students	Average attendance
University education . .	8	107	802	682
Special instruction . .	22	177	1,918	1,655
Secondary education . .	27	408	4,213	3,794
Federal primary education	672	1,801	40,595	35,811
Municipal primary education	881	708	24,861	21,886
Private primary education	298	509	17,209	15,226

(Continued on page 115)

Type of Instruction	Number of schools	Number of teachers	Number of students	Average attendance
Schools of religious orders	224	224	3,801	3,881
"Delegacional" schools	23	23	855	769
Total	1,655	3,452	98,749	83,104

PRODUCTION, MINERAL RESOURCES, ETC. About three-quarters of the entire area of Bolivia lies east of the Andes and is almost entirely undeveloped. It has been estimated that almost 5,000,000 acres of land are under cultivation, but agriculture is in a very backward condition. Irrigation by means of artesian wells is being attempted in some sections. Potatoes, cacao, coffee, barley, rice, and rubber are the principal products cultivated, Bolivia being the second largest rubber exporting country of South America (Brazil is first). The public lands of the state have an area of about 245,000 square miles, of which 104,000 are reserved for special colonization. In 1925 there were 500,000 cattle, 1,000,000 sheep, 250,000 goats, 232,455 llamas, 55,699 alpacas, 95,683 donkeys, 92,355 pigs, 63,723 horses, and 17,169 mules. Mining is the only important industry, and includes silver, copper, tin, lead, zinc, antimony, bismuth, wolfram, gold, and borate of lime. One-quarter of the world's output of tin comes from Bolivia. For the conditions in the mining industry during 1926, see below under **COMMERCE**.

COMMERCE. According to the U. S. Bureau of Foreign and Domestic Commerce, Bolivia is a country that is devoted almost entirely to the production of minerals. Its high altitude, lack of rivers and irrigation, and its enormous mineral resources all contribute to this concentration of effort, and make it necessary for Bolivia to import foodstuffs in large quantities. Similarly, manufacturing industries have progressed very little, perhaps in view of the fact that the raw materials, labor, and proper manufacturing conditions are lacking, and as a consequence, textiles of all sorts, together with other manufactures, compose the larger part of Bolivian imports.

The comparatively healthy position of the mining industry during the two years 1925-27 stimulated Bolivian purchases, for, although most of the mines are foreign owned, there are small mines which are locally owned and operated. As the mining industry improves, more wages are paid within the country, and the revenues derived by the government are increased.

The United States showed a marked increase in its sales to Bolivia in 1926 when compared with 1925, according to Bolivian statistics for 1926. The total foreign trade of the country during 1926 amounted to 193,512,756 bolivianos (1 boliviano is worth \$0.3893), of which exports totaled 122,681,287 bolivianos, while imports amounted to 70,831,469 bolivianos. This was a slight increase over 1925, when total Bolivian foreign trade amounted to 187,351,492 bolivianos, composed of 119,286,371 bolivianos for exports and 68,065,121 bolivianos for imports. Total imports into Bolivia increased 4.06 per cent in 1926 over those for 1925. The United States, however, increased its Bolivian sales 11.25 per cent, thus registering a gain nearly three times as great as that shown in total Bolivian imports. The principal imports in order of importance are shown in the following table.

PRINCIPAL IMPORTS INTO BOLIVIA

Article	1925	
	Quantity Metric tons	Value Bolivianos
Wheat flour	26,602	5,868,562
Cotton textiles	1,863	6,699,589
White granulated sugar	12,413	3,185,610
Mining machinery	3,290	2,648,911
Woolen textiles	195	1,978,320
Rice	4,791	1,271,015
Live animals	8,299	1,211,507

Article	1926	
	Quantity Metric tons	Value Bolivianos
Wheat flour	27,048	6,861,351
Cotton textiles	2,273	7,407,114
White granulated sugar	10,878	2,219,515
Mining machinery	2,384	2,402,324
Woolen textiles	228	1,962,428
Rice	6,249	1,471,246
Live animals	4,208	1,394,707

Many other items amounted to more than 1,000,000 bolivianos, which, in the order of their values, were woolen blankets, sacks for mining purposes, electrical equipment for generating light and power, men's hats, women's hats, etc., and brown sugar. A comparison of imports during 1925 and 1926 by countries of origin, discloses that the four principal suppliers of Bolivia are the United States, Great Britain, Germany, and Chile. The United States increased its proportion of Bolivian imports by 11.25 per cent; Great Britain, 13.7 per cent; Germany, 3.3 per cent; while imports from Belgium, which occupied fifth place during 1925, declined by 62.4 per cent during 1926. Imports from Chile dropped 6.6 per cent during the year.

Exports in 1926 showed a slight increase over the previous year in both value and volume. Tin exports decreased in volume but increased in value, owing to increased prices of tin during 1926. Lead, the second item in importance, declined in both volume and value, but this was more than compensated by important increases in the exportation of antimony, zinc, silver, and other articles, as is shown in the accompanying table:

PRINCIPAL EXPORTS FROM BOLIVIA

Item	1925	
	Quantity Metric tons	Value Bolivianos
Tin	54,390	79,618,768
Silver (including ore)	11,343	7,854,180
Lead	86,888	10,497,870
Rubber	8,393	7,261,998
Copper	14,659	4,096,910
Zinc	6,210	1,554,196
Bismuth	542	3,353,873
Antimony	3,146	864,951
Coca leaves	389	959,389
Salt hides	866	1,142,689
All other items	6,908	2,082,176
Total	138,619	119,286,370

Item	1926	
	Quantity Metric tons	Value Bolivianos
Tin	53,639	88,321,865
Silver (including ore)	11,820	8,695,065
Lead	80,911	7,524,389
Rubber	8,105	5,484,009
Copper	19,476	4,509,174
Zinc	17,561	8,682,752
Bismuth	375	2,868,571
Antimony	7,409	2,447,317
Coca leaves	438	1,092,990
Salt hides	758	1,080,389
All other items	9,080	2,176,270
Total	154,567	122,681,291

Great Britain continued to absorb by far the greatest share of the Bolivian products, although the United States took slightly more during 1926 than 1925. Tin, the principal export of Bolivia, is shipped to Great Britain because London is the world's chief metal market, smelting charges are lower than in the United States, and a large amount of British capital is invested in the industry in Bolivia. After the ore has been reduced to tin in pigs—practically all in Great Britain—the bulk of it is reshipped to the United States, which thus becomes the ultimate consumer. Of the total exports, Great Britain took 80.9 per cent during 1925 and 78.5 per cent in 1926; the United States received 8.2 per cent in 1925 and 9.5 per cent in 1926; Germany, Belgium, Argentina, Brazil, and France follow as markets, in the order given.

livanos, and floating debt by 18,302,578 bolivianos.

COMMUNICATIONS. The railways of Bolivia open to traffic comprise about 1100 miles. President Siles announced during the year that the La Paz-Yungas railway, the initial construction of which was begun in 1915, would be completed at once. The Yungas is a subtropical valley which begins 60 miles north of La Paz and supplies that city with the greater part of its food supply. The President had appointed a commission to go into the entire question of the most feasible and best route that should be taken. Since the beginning of the construction of the railway there has been a discussion as to whether or not it should be built to Coroico, one of the capitals of the Yungas, or in the direction of the River El Beni. Thus far the railway has been

FINANCE. For the fiscal year 1925-26 the budget estimates balanced at 44,492,183 bolivianos. The principal items of expenditure in the budget were Public debt, 19,375,880 bolivianos; war ministry, 8,492,950 bolivianos; education, 3,892,246; interior, 3,466,082; communications, 2,171,844; justice, 2,006,361. As announced in the preceding YEAR BOOK, a financial commission of six members under the direction of Professor Kemmerer of Princeton University, studied the financial situation in Bolivia with the idea of making suggestions for its improvement to the government. The magazine, *Bolivia*, for September, 1927, gave a résumé of the projects studied and submitted to the government by the mission under the following 14 headings: Reorganization of the Banco de la Nación Boliviana; an organic law for the national budgets; reorganization of the fiscal accounting, and the intervention of the government in the fiscalization of public expenses, and proper check by means of an office to be termed Contraloría; reorganization of the Bolivian Treasury Office; a general law for banks; a law for taxes on certain classes of income; a law for taxation on fixed property; a money law; a report on mining taxes; a report on the public credit of Bolivia, a report on the financing of the Cochabamba-Santa Cruz Railway; a report on the stamp law; an organic law for the customs house administration; and a reform law for railway tariffs. The public debt of Bolivia on June 30, 1927, amounted to 172,544,762 bolivianos, of which external debt was represented by 132,176,502 bolivianos, internal debt by 22,065,682 bo-

extended 130 miles; if completed to the head of steam navigation on the River El Beni, as originally planned, about 88 miles of additional construction would be required.

The Pan American *Bulletin* reported in April that the governments of Peru and Bolivia had entered into an agreement to connect the Peruvian Railroad ending at Puno, on Lake Titicaca, with the Bolivian Railroad starting at Guaqui, on the same lake, thus avoiding the boat trip now necessary between the two terminals. The new line was to follow the shores of the lake, shortening the time of transit and contributing to trade exchange between the two countries.

The *Railway Age* reported in July that the Bolivian Railway was taken possession of by the Bolivian Government in a decree issued by the President and cabinet under date of June 29. Seizure of the railroad was actuated, it was believed in Bolivia, by the suspicion which is said to have arisen that creditors who had advanced large sums to the road intended to throw it into the hands of receivers. The chief contract of the railroad with the government expired in December. The President and cabinet, citing laws which were said to authorize such action, asserted in the decree that the step was taken to protect the national welfare and the present holdings of the government in the railroad, which were estimated in Bolivia to be one-third of the whole system. The entire system of the Bolivian Railway, comprising 570 miles of road, rolling stock, shops and other equipment, became government property.

GOVERNMENT. The President, who is elected by

direct popular vote and is ineligible for reelection, is the head of the executive department, and is aided by a cabinet of six members, each in charge of a separate department. Legislative power is vested in a congress of two chambers, the senate of 16 members elected for six years, and the chamber of deputies of 70 members elected for four years. One-third of the senate and one-half of the chamber retire every two years. President in 1927, Dr. Hernando Siles, assumed office Jan. 10, 1926, for the period 1926-1930.

HISTORY. Both the United States and Bolivia were very much grieved over the death of Ignacio Calderón, (q.v.) the Bolivian ambassador to the United States and a firm and powerful friend of the Pan American movement. Bolivia was the scene of considerable unrest and disorder throughout the year. In early May the government was compelled to declare martial law because of serious riots in the capital because the professors of the National University had not been paid their salaries for several months and talked strike, in which action, of course, they were heartily endorsed by the student body. The government did not finally get control of the situation until a few had been killed and many wounded.

During August and September a more serious affair confronted the government in the form of a revolt of 80,000 Indians. The struggle that ensued was easily put down by the Bolivian soldiers inasmuch as the Indians fought with only the most primitive weapons, the sling, bows and arrows and clubs. The revolt centred around the Departments of Potosi and Cochabamba, where the Indians greatly outnumbered the whites. Various causes were given for the uprising; the chief among them were dissatisfaction with the Bolivian government and communistic propaganda chiefly from outside the country. The latter point of view was the one taken by the government which exhibited alleged documents purporting to come from Russia and instigating the communists to enlist the aid of the Indians against the government. As a result of this attitude the government took a firm hand against all known radicals and placed several of them in jail.

To the outsider the plight of the Indians was a pitiful one. Although they constitute two-thirds of the population they have absolutely no say in the government, are treated very harshly, paid little or nothing for their labor, and are denied the ordinary advantages of an enlightened government, such as education, decent living conditions, and a fair day's wage for a fair day's work. If the government's charge of communistic propaganda were true, it certainly can be accused of planting a fertile field for its incubation and growth.

For a discussion of Bolivia's interest in the Tacna-Arica dispute consult the article on **ARBITRATION, INTERNATIONAL**.

BOLL WEEVIL. See **COTTON**; **ENTOMOLOGY**, **ECONOMIC**.

BOLL WORM. See **ENTOMOLOGY**, **ECONOMIC**.

BOLTWOOD, BRITAM BORDEN. American chemist, died by his own hand at Hancock Point, Me., August 15, during a period of despondency. He was born at Amherst, Mass., July 27, 1870, and after graduating from Sheffield Scientific School at Yale in 1892 continued there as a post-graduate student, taking the degree of

Ph.D in 1897. He carried on post-graduate studies at Munich, Leipzig and Yale, and held the John Harling fellowship of the University of Manchester, 1909-10. While engaged in research at Yale and post-graduate work he was also active as a teacher, serving as an assistant in analytical chemistry, 1894-96; instructor, 1896-1900; assistant professor of physics, 1906-10; and professor of radio-chemistry, 1910, a chair he held at the time of his death. He was acting professor of chemistry and director of the Kent chemical laboratory at Yale, 1918-22. His work in radio-chemistry included the discovery of the element ionium in the radio-active group. For his work in radio-chemistry he was chosen a member of the National Academy of Sciences, and he was a frequent contributor to chemical journals. He translated: *Quantitative Analysis by Electrolysis* (A. Classen) (1898); and *Physical Chemistry for Beginners* (C. H. Van Deventer) (1899).

BONBRIGHT, WILLIAM PRESCOTT. American banker, died at New York, N. Y., November 10. He was born at Philadelphia, Pa., Feb. 12, 1859, and after studying at private schools and under private tutors took a course in economics at the Wharton School of Finance, University of Pennsylvania, before entering business with Hood, Bonbright & Co, bankers, in 1876. He was admitted to partnership in 1882, and removed to Colorado Springs, Colo., 1890, where three years later he established a banking business. Mr. Bonbright's activities extended to Europe, and during the World War his assistance to the French Government led to his being made a Chevalier of the Legion of Honor in 1919. In 1920 he retired from the presidency of the banking firm of William P. Bonbright & Company. He was also first vice president of the Société Financière pour Entreprises Électriques.

BOND, THE RT. HON. SIR ROBERT. Former Premier of Newfoundland, died at Whitebourne, N. F., March 17. He was born at St. John's, Newfoundland, Feb. 25, 1857, and was educated at Queen's College, Taunton, England, and at Edinburgh University, where he took honors in law. Even before being called to the bar he entered political life, and in 1882 was elected to the Newfoundland legislature. Two years later he became speaker of the House of Assembly, and from that time his entire life was devoted to public affairs in Newfoundland. His promotions were rapid, and he figured as a Liberal in several ministries. In 1889 he was executive councillor, with the portfolio of colonial secretary, in the Liberal ministry, a position he held until 1897. In 1900 he became premier as well as colonial secretary, continuing in this position until 1909, when the Liberal ministry was forced out by the newly formed People's Party, under Sir Edward Morris. He remained in political life as leader of the opposition until 1914, when, in protest against what he considered the bad faith and sectional aims of his party, he resigned the leadership as well as his seat in the House of Assembly. Sir Robert throughout his public life was active in behalf of Newfoundland and in imperial affairs, being appointed a delegate to the British government on the French treaties question in 1890. In the same year he was appointed by the British government to assist the British ambassador at Washington in negotiating a reciprocity treaty with the United States which later became

known as the Bond-Blaine convention of 1890. It was rejected by the British government. In 1892 he was one of the delegates appointed to confer on the Newfoundland fisheries question, and in 1895 was chairman of the deputation sent by the Newfoundland government to the Ottawa conference. In 1901 he was special delegate to the conference on French treaties, in London, and he received the freedom of the City of Edinburgh in the following year. In 1902, also, he was authorized by the British government to reopen negotiations with the United States for reciprocal trade between that country and Newfoundland, his efforts resulting in the Hay-Bond reciprocity treaty. This was signed at Washington Nov. 8, 1902, but failed of ratification in the United States Senate. In 1901 he was knighted, and in 1902 he was made a member of the Imperial Privy Council. He assisted in drafting regulations for carrying out the Anglo-French convention in 1904, and in 1906 procured the passage of a resolution in favor of old-age pensions. He opposed the union of Newfoundland with Canada, and favored a direct ocean route between Newfoundland and Ireland. He received the freedom of the Cities of London, Bristol and Manchester in 1907, and the honorary degree of LL.D. from the University of Edinburgh.

BONZANO, bonzä'no, JOHN, CARDINAL. Roman Catholic churchman, died at Rome, November 26. He was born at Casteletto, Italy, in 1867, and was ordained in Rome in 1890. Later he was made vicar general of the diocese of Vigevano and rector of the Pontifical Urban College at Rome. On Feb. 1, 1912, he was appointed apostolic delegate to the United States, and on March 3 of the same year was consecrated Archbishop of Mytilene. He had a wide acquaintance not only in his own communion, but throughout the United States. In 1922 he was elevated to the cardinalate, and in 1926 he was sent by Pope Pius XI to the 28th Eucharistic Congress, in Chicago, as the legate and special representative of His Holiness. There were in attendance at the Congress 12 cardinals, 57 archbishops, 261 bishops, 3 apostolic delegates and other church dignitaries, among whom Cardinal Bonzano was an outstanding figure in virtue of his office as legate of Pope Pius. (For details of the Congress, see article ROMAN CATHOLIC CHURCH, in the YEAR BOOK for 1926.)

BOOTS AND SHOES. There was reported a substantial gain in activity in the shoe trade in 1927, the output for the United States being the largest since 1923, and the general attitude which prevailed at the end of the year was one of optimism and satisfaction with business conditions. Factories in Columbus (Ohio), St. Louis, and other shoe centres were running with full schedules and business showed no slackening, many of the concerns being unable to keep up with orders. During September, 90 per cent of the workers in Massachusetts boot and shoe factories were employed on full-time schedule and expansion was carried on, which resulted in increased production, in Lynn, Haverhill and Brockton, one firm in the Old Colony Section of Massachusetts reporting a gain of 22 per cent up to December 1 over the same period in 1926. Factory conditions in Massachusetts, however, at the end of the year were marked by some labor dissatisfactions which were retarding the volume of business.

The output of 343,605,905 pairs of shoes from the 1400 shoe-manufacturing plants in the United States for 1927 showed an increase of 5.9 per cent over the output for 1926, when 324,513,695 were manufactured. Of the total production, 116,258,866 pairs, or 33.8 per cent, were for women, and 95,328,098, or 27.7 per cent, for men; the production of boys' and youths' shoes totaled 24,229,296 pairs; of misses' and childrens', 39,649,961 pairs; and all others, 68,139,684 pairs, included infants' shoes, 24,541,551 pairs; athletic and sporting shoes (leather), 2,477,518 pairs; shoes with canvas, satin and other fabric uppers, 3,301,433 pairs; all-leather slippers for house wear, 5,085,294 pairs; part-leather slippers for house wear, 24,072,828 pairs; and footwear not elsewhere classified, 8,661,060 pairs. Rather large quantities of men's heavy shoes, reported under "men's" shoes in 1927 were reported by manufacturers in previous years as "athletic" shoes, which accounts to some extent for variations in the 1927 figures for men's and athletic shoes, in making comparisons with previous years. There was a marked decrease in the production of shoes with canvas, satin and other fabric uppers in 1927, as compared with the previous years.

According to the report of the U. S. Department of Commerce, Massachusetts ranked first in the production of shoes during 1927, when a total of 78,182,264 pairs were manufactured, including 20,840,782 pairs of men's shoes and 34,226,555 pairs of women's shoes, or 21.7 and 29 per cent, respectively, of the national output, while New York State was the nearest competitor, with 75,687,268 pairs.

There was an increase in the imports of boots and shoes in 1927, the total for the year being 3,003,839 pairs, including 1,477,435 pairs of leather boots and shoes (free); 460,073 pairs of leather slippers (free), and 1,066,331 pairs, dutiable footwear. Compared with 1926 the quantity of boots and shoes imported increased 38.1 per cent; leather slippers, 21.9 per cent; and dutiable footwear 17.4 per cent.

The industry devoted considerable attention during the year to corrective footwear which resulted in the introduction of departments devoted to corrective problems in numerous retail establishments to take care of the trade which required this type of service. Juvenile stores made progress in their policy of developing fewer lines and more sizes, in an effort to cope with the problem of merchandizing juvenile goods which had been a serious matter in the past. With the marked advance in prices of leather during the year the shoe industry was confronted with the necessity of preparing the public for advanced shoe prices during 1928.

The work of the Style Conference which met November 1 in New York was considered an important and advantageous factor due to its findings, which were at the service of the industry, and its coöperation with allied wearing apparel industries, and various branches of the shoe industry. The various conventions which met during the late autumn stressed the importance of developing a shoe consciousness among men and reported an increased demand for men's shoes, and a strong demand for light-colored shoes for women for 1928. The outstanding style development of the late autumn and winter season was in the production of boots

for winter wear, which, in spite of hesitation on the part of manufacturers, gained a strong foothold in the trade. Considerable activity was also reported in the introduction of stylist departments in the manufacturing and retailing branches of the shoe industry.

BORNEO. An island in the Malay Archipelago, next to Australia, Greenland, and New Guinea the largest in the world. See **BRITISH NORTH BORNEO, BRUNEI, SARAWAK, and DUTCH EAST INDIES.**

BOSNIA AND HERZEGOVINA, hër'tsā-gō-vēna. Formerly provinces in the Turkish Empire; now provinces of the newly established state of Jugo-Slavia (q.v.). In 1908 control over them was acquired by the Austro-Hungarian Empire. In 1918 after the collapse of this empire they were turned over to Jugo-Slavia. Area, 19,768 square miles; population, according to the census of Jan. 31, 1921, 1,889,929.

BOSTON MUSEUM OF ART. See **ART MUSEUMS.**

BOSTON UNIVERSITY. A non-sectarian institution of higher education at Boston, Mass.; founded in 1869. The enrollment for the autumn term of 1927 was 9611, of whom 4805 were men and 4806 were women, distributed as follows: college of liberal arts, 897; college and extension courses, 721; college of business administration, 3559; college of practical arts and letters, 973; school of theology, 242; school of law, 560; school of medicine, 206; school of education, 1338; art department, 91; school of religious education and social service, 504; graduate school, 520; educational extension courses, 536. The autumn enrollment in extra-mural courses was 313. The summer session enrollment was 1206. Total registration for the first half of the academic year was 11,403. The faculty numbered 495. The libraries contained 98,148 volumes and 17,400 pamphlets. Productive funds of the university, exclusive of \$302,596 subject to annuities, amounted to \$3,020,664, and the income from productive endowment was \$135,404. The president of the university was Daniel L. Marsh, LL.D., Litt.D.

BOSWORTH, EDWARD INCREASE. American theologian, died at Oberlin, Ohio, July 1. He was born at Dundee, Ill., Jan. 10, 1861, and after studying at Oberlin College graduated from Yale in 1883. He returned to Oberlin to take the degree of B.D. in 1886, in which year he was ordained in the Congregational ministry and became pastor of a church at Mt. Vernon, Ohio, for a year, returning to Oberlin in 1887 as professor of the English Bible. In 1890 he studied at the University of Leipzig, and he spent the winter of 1891-92 at Athens, Greece. On his return to Oberlin in 1892 he became professor of New Testament language and literature, a position he held until his death. He was also dean from 1903 to 1921, and from 1921 to 1923 dean of Oberlin Graduate School of Theology. In 1918-19 he was acting president of Oberlin College. He lectured in Japan in 1907 and in Turkey in 1911. He was a member of many learned societies, and his writings include: *Studies in the Acts and Epistles* (1898); *Studies in the Teaching of Jesus and His Apostles* (1901); *Studies in the Life of Jesus Christ* (1904); *New Studies in Acts* (1908); *Christ in Everyday Life* (1910); *Thirty Studies About Jesus* (1917); *Commentary on Romans* (1919); *What It Means to Be a Christian* (1922); and *Life and Teach-*

ing of Jesus According to the First Three Gospels (1924).

BOTANY. The eighty-fourth annual meeting of the American Association for the Advancement of Science, with about 25 affiliated societies, met at Nashville, Tenn., December 26 to 30, 1927. The British Association for the Advancement of Science met at Leeds, England, August 31 to September 7; the Indian Science Congress at Lahore, India, January 3 to 8; the South African Association for the Advancement of Science at Salisbury, Southern Rhodesia, June 29 to July 4; and the French Association at Lyons, France, July 24 to August 1. At all these scientific meetings papers were presented that are of interest to botanists. The Fifth International Congress of Genetics was held in Berlin, Germany, September 11 to 18 with a large attendance. At the First International Congress of Soil Science, held at Washington, D. C., June 13 to 22, a number of papers were read that were of interest to ecologists and biologists in general.

NEW JOURNALS. Among the journals that made their initial appearance during the year which may be found of interest by botanical workers are: *Protoplasma*, an international journal of the physical chemistry of protoplasm; *Deutsche Landwirtschaftliche Rundschau*, a monthly abstract journal of technical agriculture; and *International Bulletin of Plant Protection* issued by the International Institute of Agriculture.

The botanical contributions that appeared during the year were very numerous and only a very limited number can be noted.

PHYSIOLOGICAL STUDIES. Baly and associates have recently given further accounts of their investigations on photosynthesis (*Nature*, November 19, 1927). It was found that when an aqueous solution of carbonic acid in quartz tubes was exposed to ultra-violet light a photo-stationary state was established and an organic compound was produced that was considered to be a complex aldehyde. The reaction apparently took place on the surface of the tubes. Photosynthesis of carbohydrates from carbonic acid with the liberation of oxygen also occurred under the influence of visible light in the presence of a catalyst. A marked similarity is claimed to exist between photosynthesis in plants and that in vitro. Ordinary formaldehyde does not occur in either reaction. In plants the limiting surface is believed to be the chloroplasts, and their orientation with respect to the direction of light rays is one of the factors in controlling photosynthesis.

As a contribution to the study of photoperiodism of plants (YEAR BOOK, 1926, p. 104), Nightingale found carbohydrates accumulate in short-day plants probably through their limited utilization of various forms of nitrogen. When carbohydrates are depleted amino acid and other forms of nitrogen are produced at the expense of protein. Plants exposed to short periods of daily illumination were found to gain more total nitrogen than those subjected to long photoperiodism. Gilbert claims that there was an increase in carbohydrates in plants grown at high temperatures with a short-day illumination and at low temperatures under a long period of exposure to light. Popp reports that when plants were subjected to different portions of the spectrum he found that on the whole the ultra-violet rays are not indispensable, but the blue-

violet portion of the spectrum is essential for normal, vigorous growth. Dastur claims that there is a close correlation between the photosynthetic activity of leaves and their water content. Fudge found that the transpiring power of maize plants could be taken as an index to the total dry weight produced. Clum reports that leaves are nearly always warmer than the surrounding air, differences of from 5 to 10° C. being observed in some cases, and contrary to common belief the effect of transpiration on cooling leaves is so insignificant as to be unable to protect them from the burning effect of bright sunlight.

Ivanov has propounded what he claims is a fundamental law relating to the occurrence of specific substances in plants (*Izv. Akad. Nauk.*, 1926). He claims that every species of plant shares in the chemical attributes of those with which it is closely related. As the relation becomes more distant other substances appear that have rather simple chemical relations to the original substances. This is said to reveal an evolutionary process that may form a basis for the grouping of plants, the possibility of crossing them, and as a guide for attempts for their acclimatization. Reyhler claims to have produced hereditary changes in plants by subjecting them to conditions other than those found in nature, and he believes that mutations occur in this manner and they may be artificially produced in part at least (*La Mutation*, 1926). Goodspeed and Olson have produced many new forms of tobacco by exposing the reproductive cells to X-rays, and the visible modifications are believed to be capable of hereditary transmission (*Science*, November 11, 1927).

Satina and Blakeslee made a study of the Manoilov reaction and other tests for the determination of sex in plants (*Natl. Acad. Sci. Proc.*, 1926, p. 191). These tests are based on the reaction to certain dyes, and in the molds what has been called the + sex was found to correspond to the female and the — strain to the male. In testing dioecious plants the sex organs responded to the expected sex reactions. Perkins also investigated this reaction, and he claims it is due to certain oxidizing and reducing properties, although they are undoubtedly closely associated with sex conditions (*Nature*, November 5, 1927).

That small quantities of various elements are necessary for the normal growth of plants has been shown since Mazé in 1914 called attention to the fact that aluminum, sulphur, and magnesium were essential for the growth of maize (*Year Book*, 1915, p. 94). Brenchley and Warrington found that boron was required by some plants (*Ann. Bot.*, 1927, p. 167), and this has been recently confirmed by Sommers for about 16 species of plants. Zinc was also found a limiting factor for the growth of a number of species of plants, normal growth and reproduction taking place only when zinc was added to the culture solutions. Simmonds summarized some of the recent work on the requirements of plants of small quantities of various elements, and he calls attention to the need of exercising extreme care in experiments that these elements from unknown sources shall be excluded (*Science*, 1927, p. 482). McHargue has shown the need for manganese, etc., by plants (*Year Book*, 1922, p. 92), and McLean has found that manganese injected into leaves through their stomata

acts similarly to applications to soil in correcting chlorosis of plants.

Many attempts have been made, without much success, to determine the best combination of fertilizer elements for the growth of plants in soils and water cultures. Hibbard has come to the conclusion, after a prolonged study of the growth of cereals, that it is impossible to produce a physiological balance in the soil that is the best for growth and yield. It is suggested that through the long period of growth under domestication the plants have become accustomed to wide ranges in salt solutions (*Pl. Physiol.*, 1927, p. 1). Liu from extensive experiments with tobacco was unable to determine a combination of fertilizer elements that was best for growth to maturity.

After the discovery that ethylene and other gases would hasten the coloring of citrus fruits, investigators have given attention to their commercial use and the changes brought about, especially in those products used as food. Chace and Church have reported on the use of ethylene gas in ripening citrus fruits, avocados, bananas, dates, persimmons, and tomatoes. Satisfactory results were obtained with most fruits, and no deleterious changes were found in the edible portions of the fruits except with avocados. With these there was an undesirable darkening of the pulp. The astringency of the persimmon was destroyed. Green tomatoes were not uniformly colored by the treatment (*Indus. and Engin. Chem.*, 1927, p. 1135). Harvey, experimenting with the same gas, found that the respiration of bananas was greatly accelerated, ripening was hastened, and the treated fruit had from 20 to 25 per cent more sugar and correspondingly less starch than untreated fruit (*Pl. Physiol.*, 1927, p. 357). Mack reports that ethylene gas accelerated the blanching of celery through the stimulation of the enzymes which are normally concerned in the breaking-down of various compounds in the plant. Denny found that exposing citrons fruit to ethylene gas (1 part to 10,000) greatly increased the respiration of the fruit, the amount of carbon dioxide given off being doubled in 48 hours.

MISCELLANEOUS STUDIES. MacDougal and Smith report having found ray parenchyma cells with clearly defined protoplasts and apparently normal nuclei 70 layers deep in the heartwood of the California redwood tree, indicating a life of nearly a century. Similar long-lived cells were found in the giant cactus and in the melon cactus. In the giant cactus the cells continue to enlarge for a century. In the melon cactus they continue to grow for 10 years or more and remain functional for a period of 100 years or more. In the redwood the cells attain full size in a few days, but they remain alive for a century or more (*Science*, 1927, p. 456).

It has been observed frequently that yellow leaves in the autumn contain less nitrogen than green leaves. Combes has investigated this phenomenon in leaves of oak, beech, and chestnut and found that in leaves that turned yellow on the trees, as in autumn coloring, there was a marked lowering of the nitrogen content as compared with leaves that became yellow after removal from the tree. The nitrogen removed from the leaves was found to accumulate first in the branches and later it was translocated to the roots (*Rev. Gén. Bot.*, 1926, p. 430).

Comments are frequently heard on the failure

of potato plants to develop true seed in many places. Stow has made a cytological study of this question, and he found that temperature is the principal factor responsible for sterility, viable pollen not being produced at temperatures of 78° F. or more. At low temperatures, 60 to 68°, chromosome reduction proceeds normally, and viable pollen is produced for fertilization of the ovules (*Proc. Imp. Acad. Japan*, 1926, p. 426).

Differences in the degree of winter hardiness of plants has been attributed to variations in the pentosan contents of the plants. Doyle and Clinch, from a study of the resistance of coniferous trees to winter injury, came to the conclusion that there is no relation between the pentosan content of conifers and their tolerance of cold (*Roy. Dublin Soc. Sci. Proc.*, 1926, p. 219).

On account of the increasing use of arsenicals for the control of insect pests, the effect of their repeated application on subsequent plant growth where the arsenic was allowed to accumulate in the soil was investigated by Morris and Swingle. Plants were found to vary widely in their tolerance of arsenic poisoning. Cereals and grasses were able to withstand considerable accumulations of arsenic in the soil, but beans and cucumbers were severely injured by relatively small amounts. Tomatoes were adversely affected by 10 parts per million of arsenic trioxide in the soil (*Jour. Agr. Res.*, 1927, p. 59).

PLANT DISEASES. Plant diseases continue to be an important factor in crop production in all countries. *The Plant Disease Reporter*, issued by the U. S. Department of Agriculture, claims the loss to the wheat crop of the United States for the years 1918 to 1925, inclusive, amounted to 10.82 per cent. In 1927 the wheat rust situation throughout the country was favorable on the whole. Winter wheat was not severely infected but the spring wheat areas of Minnesota, North Dakota, and South Dakota suffered losses estimated at 30.35, 6.67, and 5.8 per cent, respectively. In Illinois losses from stinking smut in 1927 are estimated at \$2,298,000, one out of every 5 bu. of wheat produced in the State having been docked at the elevator an average of 8 cents on account of the smut. Flag smut is said to have caused a loss of 2,000,000 bu. in the Australian wheat crop of 1926. Pesola reports a severe infestation of wheat in Finland by yellow rust (*Puccinia glumarum*) with reduced yields of from 20 to 30 per cent in 1927.

A number of new plant diseases were described during the year and others were reported to have extended their range. The chestnut blight that has destroyed nearly all the original stand of chestnut trees in the eastern part of the United States was found in a nursery in Iowa during the year. The blister rust of pear, hitherto reported on pear trees in Delaware only, was discovered in Iowa on both pear trees and mountain ash. Peach yellows was definitely reported in Georgia. Take-all of wheat was found in fields of eastern Maryland. The European larch canker (*Dasyctypha caryocina*) was recently reported in Massachusetts where it was attacking introduced and native species of larch, Douglas fir, pitch, and Scotch pines. The evidence seems quite conclusive that the disease was introduced on larch trees imported from Scotland in 1904 and 1907. A new disease of wheat, char-

acterized by brownish-black areas on the stems just below the heads as the grain is approaching maturity, was reported in England by Biffen. No organism was found in the diseased material. A brown rot of oranges and lemons caused by *Phytophthora hibernalis* is described by Carne as occurring in Australia and elsewhere. Hopkins claims to have isolated two species of bacteria from cotton bolls in Trinidad. One is believed to be associated with the fungus usually considered responsible for cotton anthracnose. Stahl has questioned the identity of the mosaic disease of sugar cane and a similar disease of corn. It is claimed in Cuba that the diseases are quite distinct. Recent work by Valleau and others has shown a pythium-like organism in connection with corn root rot, and the seed-borne organisms usually considered to cause root rots are believed to be secondary invading organisms.

The campaign for the control of the white pine blister rust by the eradication of wild and cultivated currants and gooseberries near stands of white pine has been continued. Since 1922, under cooperative relations established between the U. S. Department of Agriculture and various State and other agencies in the eastern white pine area, more than 53,000,000 ribes bushes have been destroyed and the menace of the blister rust removed from over 5,000,000 acres of land. The work of destroying the alternate host plant of the white pine blister rust is progressing in the eastern white pine belt at the rate of about 800,000 acres a year. In the Pacific Northwest the blister rust has slowly spread, and it has reached the edge of the western white pine belt in Idaho. Infected currant bushes have been found in northwestern Oregon, northeastern Washington, and northern Idaho. In order to check its spread the cultivated black currant, which is one of the most important alternate hosts of the fungus, has been nearly eradicated in Montana, Idaho, Washington, Oregon, and most of California. The destruction of susceptible wild species is being actively carried on. Studies in British Columbia have shown that the rust can spread further from infected trees than formerly thought probable, infected currant bushes having been found more than 200 miles from any known white pine tree.

One of the most active fields of phytopathology during the year 1927 was the study of the so-called virus or mosaic diseases of plants. Jaczewski has enumerated 11 types of degeneration, or virus, diseases of potatoes in Russia, nearly all of which are said to be prevalent in regions where foreign varieties have been introduced for cultivation. Two new virus diseases of potatoes were reported, one in England that is characterized by tall, weedy growth of the vine accompanied by the production of few small tubers, and the other in Utah. With this disease aerial tubers are produced to the almost complete exclusion of subterranean ones. Whitehead claims leaf roll of potatoes can be controlled in Wales by roguing out the diseased plants and early digging of tubers intended for planting. The method of roguing is recommended by many investigators as about the only practicable method of controlling mosaic diseases in general. Temperature, water supply, etc., have been found to cause a masking of symptoms of various virus diseases, the particular trouble reappearing under changed conditions of growth. Atanasiu found all varieties of potatoes tested

were subject to stipple-streak, a virus disease, and one variety transmitted the disease although not showing any of the symptoms of infection itself.

Johnson, who has studied the virus diseases of tobacco quite extensively, reports that there are at least 11 different viruses of tobacco and related plants and that two or more can be present in a plant. In most cases they are fairly stable, but in some instances it was possible to attenuate or increase their virulence. Blodgett transmitted the virus of mosaic tobacco to the potato and when transferred back to tobacco combined symptoms were produced of ordinary tobacco mosaic and those due to the virus carried by sound potatoes. Moore reports a mosaic of tobacco in South Africa that is associated with sunburning of the leaves.

One of the interesting contributions to our knowledge of virus diseases was the discovery that the disease of sugar beets known as curly top was connected with diseases of several other important crops. Carsner has described a mosaic disease of beans that was carried from diseased sugar beets to beans by the leaf hopper, *Utettia tenella*. This has been confirmed by other investigators, and by what appears to be conclusive evidence it is shown that the western yellow blight of tomatoes is due to the same cause. Severin found 25 species, which include 46 horticultural varieties, representing 16 genera of plants subject to natural infection with curly top virus in California.

Considerable study was reported on the nature of the viruses responsible for these diseases and the effect of physical factors on them. Johnson found by heating inoculated plants the usual symptoms of disease were masked. McKinney claims the viruses can be diluted by heating and the addition of water. Kraybill and Eckerson studied the virus of tomato mosaic and found the infective principle did not pass through special fritted glass filters when colloidal material was present but did when the colloids were removed by preliminary filtering. Vinson claims to have precipitated the virus of tobacco mosaic, the precipitate being infectious when dissolved in distilled water. Goldstein reports having found in the tissues of dahlia plants affected with mosaic intracellular bodies similar to those described by others as occurring in mosaic plants. Jones described under the name *Plasmodiophora tabaci* a mycetozoan found in tobacco plants which had mosaic symptoms.

Plant breeders for a time were quite sanguine that by applying principles of genetics they would be able to produce varieties of economic plants that would be immune to specific diseases, and considerable progress was made along this line. Recently this work was complicated by the discovery that there are physiologic forms of many species of fungi that do not behave alike, and plants bred to resist a local strain of a fungus may prove very susceptible when subjected to one from another locality. There are known to be about 40 physiologic forms of wheat stem rust, 2 or 3 of wheat smut, 5 of crown rust of oats, 5 of rye ergot, 37 of *Helminthosporium sativum*, the cause of foot rots of cereals, etc. With the knowledge of this variation in the fungi, plant breeders have resumed their investigations, but thus far they have not reported any variety or strain of plant

that is resistant to all the known forms of fungi for which it is a host.

NECROLOGY. Among botanists whose deaths were reported during the year were: Dr. Bruce Fink (q.v.), professor of botany of Miami University and well known as a student of lichens, July 10, 1927; Dr. Benjamin Daydon Jackson, internationally known on account of his connection with *Index Kewensis*, October 12; Dr. A. A. Lawson, University of Sydney, New South Wales, March 26; Dr. F. C. Newcomb, formerly head of the botany department of the University of Michigan, October 1; Prof. Ludwig Radlkofer, director of the botanic museum, Munich, Germany, February 16; Dr. C. S. Sargent (q.v.), forest botanist and director of Arnold Arboretum, Jamaica Plain, Boston, Mass., March 22; Dr. E. F. Smith, eminent for his work on bacterial diseases of plants, April 6; George B. Sudworth, dendrologist of the U. S. Forest Service, May 10; Victor Vermorel, viticulturist and well known for his inventions of spraying apparatus, October 16; and Dr. W. P. Wilson (q.v.), formerly head of the botanical department of the University of Pennsylvania, May 12.

BOURCHIER, *bôd'chi-ër*, Fr. pron. *bôd'shyd*, ARTHUR. British actor-manager, died at Johannesburg, South Africa, September 14. He was born at Speen, Berkshire, England, June 22, 1864, and was educated at Eton College and Christ Church, Oxford. In his undergraduate days he obtained official permission for and later the coöperation of the late Professor Jowett, then vice chancellor, in the founding of the Oxford University Dramatic Society and the building of a theatre at Oxford where he played Shakespearean and other parts. He was a member of the Old Stagers and the Windsor Strollers, and made his first professional appearance with Mrs. Langtry at the Theatre Royal, Wolverhampton, as Jaques in *As You Like It*, September, 1889. Later he played with Charles Wyndham at the Criterion, where they produced a notable series of plays, and then joined Augustin Daly's company in the United States, playing with Ada Rehan and creating the part of Robin Hood in Tennyson's *Foresters*. He became a manager in 1895, and produced many successful plays, of which *Treasure Island*, in which he played Long John Silver, *Tilly of Bloomsbury*, and Shakespearean plays, were notable. He was interested in the Garrick Theatre, and was a lessee of the Strand Theatre in 1919, creating here also a number of notable rôles. His publications, which included a number of adaptations from foreign plays, were as follows: (Adapter) *Femmes Qui Pleurent*; *Jean-Marie*; *Der Rabenwater*; *Monsieur le Directeur (The Child Widow)*; *Mr. Richards*; *The Cricket on the Hearth*; *La Robe Rouge (The Arm of the Law)*; *Down Our Alley (Crainquebille)*; and *The Duel*.

BOWDOIN COLLEGE. An institution of higher education at Brunswick, Maine; founded in 1794. The fall session of 1927 had an enrollment of 554, including: seniors, 94; juniors, 124; sophomores, 159; freshmen, 173; specials, 4. There were 46 members on the faculty, including 8 members appointed after June, 1927. The amount of the productive funds was \$4,450,000, a gift of \$50,000 being made to the endowment fund during the year. A swimming pool costing \$300,000, and a Union building costing \$175,000 were completed, while a chapel organ was

installed at a cost of \$25,000. The library contained 145,000 bound volumes and many thousand unbound pamphlets. President, Kenneth Charles Morton Sills, LL.D.

BOWEN, HERBERT WOLCOTT. American diplomat and writer, died at Woodstock, Conn., May 29. He was born at Brooklyn, N. Y., Feb. 29, 1856, and after studying at the Brooklyn Polytechnic Institute and in Europe became a member of the Class of 1878 at Yale. He graduated in law at Columbia University, LL.B., *cum laude*, in 1881, and was admitted to the New York bar, where he practiced 1884-90. In the latter year he was made consul at Barcelona, Spain, serving in that capacity until 1895, when he was promoted to consul general, continuing until 1899. He was present in Spain at the time of the outbreak of the Spanish-American War. In 1899 he was sent to Persia as minister and consul general at Teheran, and in 1901 was minister to Venezuela, serving until 1905. During his service in Venezuela he became involved in a difference with the Venezuelan government, due to a Venezuelan war ship, flying an American flag, firing upon Bolivar. This resulted in an apology from the Venezuelan government and a salute to the American flag from the Venezuelan vessel. Later he prevented the Government of Venezuela imprisoning German and British subjects. He served as consul for the United States and Venezuela at the Hague Court in the Venezuelan case in 1903. In 1905 he retired from the American diplomatic service, being recalled by President Roosevelt after a disagreement between the minister and Francis B. Loomis, assistant secretary of state. Mr. Bowen was district chairman of the Connecticut State Council of Defense in 1917. In 1903 he received from Yale the honorary degree of M.A. He was the author of: *Verses* (1884); *Losing Ground* (1889); *In Divers Tones* (1890); *De Genere Humano* (1893); and *International Law* (1895).

BOWLES, REAR ADMIRAL FRANCIS TIFFANY, U. S. N. American naval constructor, died at Barnstable, Mass., August 3. He was born at Springfield, Mass., Oct. 7, 1858, and after graduating from the United States Naval Academy in 1879 studied at the Royal Naval College, Greenwich, England, taking the post graduate degree of Naval Architect. In 1882 he was appointed to the United States Naval Advisory Board, and served as director of repairs and construction at the Norfolk, Va., and Brooklyn, N. Y., navy yards. In 1901 he became chief constructor of the United States Navy with the rank of rear admiral. He resigned in 1903 to become president of the Fore River Shipbuilding Corporation, at Quincy, Mass. He was interested in the development of the Cape Cod Canal. In 1917 he became manager of the division of construction and later assistant general manager of the United States Shipping Board of the Emergency Fleet Corporation, at Washington, D. C. He was a member of the Institute of Naval Architects of London, and a past president of the Society of Naval Architects and Marine Engineers of the United States.

BOWLING. The twenty-seventh annual tournament of the American Bowling Congress was held at Peoria, Ill., the winners in the various events being: Individual, William Eggars, Chicago, 706; two-man team, M. Flick-E. Snyder, Elm, Pa., 1317; five-man team, Tea Shops,

Milwaukee, 3190; all events, Bernardo Spinella, New York City, 2014.

BOXING. The most important event in the boxing world in 1927 was the ten-round bout between Gene Tunney, heavyweight champion of the world, and Jack Dempsey, from whom Tunney had wrested the title the previous year. This fistic battle took place in Chicago and 120,000 persons paid about \$2,500,000 for the privilege of seeing it. The affair set a new record both in attendance and in receipts.

Tunney retained his title, but an unfortunate episode developed in the seventh round of the bout. In this round Dempsey, who had been clearly outboxed, suddenly landed a terrific blow to the jaw which sent Tunney crashing to the floor. The referee, according to some of the ring-side experts, did not begin the count over the prone Tunney at once, while others maintained that the referee actually could have counted fourteen before the dazed Tunney was able to regain his feet. At the call of "nine," however, Tunney was again erect in the ring and succeeded in keeping away from Dempsey until the round ended. From this point on Dempsey was wholly outclassed and had the limit been longer than ten rounds Tunney would undoubtedly have scored a knockout. The referee answered the storm of criticism which centred about his count in the seventh round by explaining that the boxing law of Illinois made it mandatory that when a fighter was knocked down his opponent should retire at once to a neutral corner and that the count must not proceed until he did. The referee contended that he warned Dempsey to retire thus, but that the latter failed to do so.

Another unsatisfactory bout of the year was that between Dempsey and Jack Sharkey, the winning of which by the former gave him his chance for the title bout with Tunney. Again the seventh round figured in a controversy. According to the referee, Dempsey won in this round by a knockout but Sharkey and his backers contended that the blow that ended the battle was a foul and this contention was upheld by several of the newspaper critics present.

In the light heavyweight field Tommy Loughran of Philadelphia established himself at the top by his defeat of Jimmy Slattery. Jack Delaney had previously surrendered the title in this class because of his inability to make the required weight.

Joe Dundee won the world's welterweight championship from Pete Latzo in June but failed to defend his title. Mickey Walker also retained his crown in the middleweight class, refusing to meet the late Tiger Flowers but contenting himself with a bout in England with Tommy Milligan who did not rate very highly. Both Dundee and Walker were suspended in New York State for their failure to face worthy opponents.

In the lightweight division practically the same situation existed, Sammy Mandell, the champion, having declined to defend his title against any strong opponent during the year. Tony Canzoneri and Benny Bass were disputing the ownership of the featherweight crown relinquished by Louis ("Kid") Kaplan.

Many observers maintained that commercialism was obtaining a firmer grip each year on professional boxing and movements were started in various sections of the United States during

1927 to secure legislation which would provide for better regulation of match-making and the conduct of bouts. Those in control of the sport were also faced with the probability that Congress will impose a prohibitive tax of 25 per cent on boxing admissions in excess of \$5. This proposal received the indorsement of the committee in charge and was incorporated in the tax measure when Congress met in December. If enacted it would sound the death knell of mammoth purses and perhaps check the trend of the sport toward commercialism.

The Amateur Athletic Union championships were held at Boston, the winners in the various classes being:

112 pounds, Harry Liebenson, New York City; 118 pounds, Thomas Paul, Buffalo, N. Y.; 126 pounds, Chris Batahno, Hartford, Conn.; 135 pounds, Frank Burke, San Francisco; 147 pounds, Tommy Lowm, New York City; 160 pounds, Joe Hanlon, New York City; 175 pounds, George Hoffman, New York City; heavyweight, Milo Malory, San Francisco.

Penn State College boxers won the intercollegiate championship with 22 points. U. S. Naval Academy, victor in 1926, finished second with 21 points and Pennsylvania and Massachusetts Tech. tied for third with 7 points each. The individual winners in the various classes follow:

115 pounds, R. C. Collins, Annapolis; 125 pounds, D. J. Weintraub, Annapolis; 135 pounds, Peter Cordasco, Syracuse; 145 pounds, M. R. Gerra, Annapolis; 160 pounds, Allie Wolff, Penn State; 175 pounds, A. Benedict, Penn State; heavyweight, Steve Hamas, Penn State.

BOY SCOUTS OF AMERICA. An organization incorporated in 1910 and chartered by Congress in June, 1916, to develop the character of boys and train them for the duties of adult life by influence brought to bear in their work and play. The National Constitution of the Boy Scouts of America declares the intention to "promote the ability of boys to do things for themselves and others, to train them in scout craft and to teach them patriotism, courage, self-reliance and kindred virtues." Each boy joining the organization takes the Scout Oath, and the Scout Law requires the members to exert such qualities as trustworthiness, helpfulness, loyalty, kindness, cheerfulness, bravery, cleanliness, and reverence. Among the foremost scout activities are camping and hiking, nature study, and many kinds of outdoor work, exercise, and craftsmanship. Successive ranks in membership are attained by passing tests graded in difficulty. Merit badges, 86 in number, may be attained by meeting requirements for each. These cover proficiency in pursuits both of the useful and of the hobby type, such as dairying, plumbing, pioneering, physical development, astronomy, music, chemistry, and others equally diverse. By attaining certain numbers of the merit badges, a boy may rise to the higher ranks of Star, Life, and Eagle scout.

In 1927, 350,000 boys spent a week or more in camp under Boy Scout auspices. Local councils conducted 652 camps; at least 2400 troop camps were also conducted. The Boy Scout movement, in cooperation with the Forestry Department, fights and prevents forest fires, conserves wild life, and plants trees. It renders services in local campaigns of various sorts and cooperates with many national societies and movements. Membership in 1927 was 795,956, and there were 180,447 Scout leaders. The National Council, the

governing body, has its offices in the Park Avenue Building, 2 Park Avenue, 32nd and 33rd Streets, New York. In 1927 the officers were: Walter W. Head, Omaha, Neb., president; George D. Pratt, treasurer; James E. West, Chief Scout Executive; Daniel Carter Beard, National Scout Commissioner; Mortimer L. Schiff, International Commissioner. Regional Scout districts, 12 in number, under direct supervision of the National Council's National Scout Executives, were subdivided in 1927 into 661 local councils, of which 639 supported paid executives and maintained permanent headquarters. The boys were organized into troops of 32 each. The troops are made up of patrols of eight or less, each under a boy leader. In small areas, a farm or home Scout Patrol may be formed with as few as four boys. Boys who live in areas so isolated that they cannot join a Troop or Patrol, may become Lone Scouts and carry on the Scout programme alone. Sea Scouting is a part of the Boy Scout programme and provides for older boys training in seamanship and water activities. A scoutmaster commissioned by the National Council is provided for each troop. He must be an adult citizen of proved fitness. Troops are commonly formed in connection with schools, churches, or other existing bodies, and each must be sponsored by a troop committee of three or more adults, who select the scoutmaster and supervise the execution of the programme. The movement is non-sectarian, and without military or political connection. The official magazine is *Boys' Life*. The organization also publishes magazines for scout leaders, merit badge pamphlets, and other material pertaining to the movement.

BRAIN PANTHEON. See **PSYCHOLOGY**.

BRANDES, brän'dēs, GEORGE MORRIS COHEN. Danish critic and biographer, died at Copenhagen, February 19. He was born at Copenhagen, Feb. 4, 1842, the eldest son of a Jewish merchant, Hans Brandes. From his mother, who was a freethinking Jewess of strong character, the son inherited independence of mind. He was educated at the University of Copenhagen, and traveled abroad extensively. In 1867 he began to study the critical methods of the French, and he adopted a broad and cosmopolitan view of literary history which previously had been unknown in Scandinavia and which was to become his main characteristic as an author. He also appreciated the growing importance of Ibsen and his genius, and became an intelligent supporter of that dramatist. Brandes' first collection of essays, *Aesthetic Studies*, appeared in 1868, and he then determined to come closely in contact with European modern thought. With that end in view he spent nearly two years in Paris, Rome and London, returning in 1871 to become docent at the University of Copenhagen. In Denmark he was frankly an innovator, and his views on philosophy, literature and religion, so novel and broad, rendered his position extremely difficult, while his talents were generally unappreciated. At the university, where he taught from 1872 to 1877, he delivered a series of lectures which he named *Main Streams of Literature in the Nineteenth Century*, and which he published in a series of volumes, 1872-82; the first, *The Emigrant Literature*, appeared in February, 1872. On the death in 1872 of Carsten Hauch, a Danish poet who had been professor of literature and aesthetics at the University of

Copenhagen since 1851, a memorandum was found in which the opinion was expressed that Brandes was the best fitted of all possible candidates to succeed to the chair. The talents of Brandes did not appeal to the university, on account of his radical innovations and unconventional point of view, but he was allowed to lecture in the public hall, and delivered a second series of lectures, which were published as *The Romantic School in Germany*. In October, 1877, he went to Berlin, where he lived for five years, contributing to German newspapers and lecturing. In 1882 he returned to Copenhagen, where a group of sympathizing friends guaranteed a stipend of \$1,000 a year to enable him to act as a private professor, since the university remained closed to him. On the other hand, the university left the chair of literature vacant, in recognition of his power and position in the critical world. From this time on Brandes enjoyed complete recognition in Denmark, and his work became well known among scholars abroad. Particularly with the liberals and with the young he was intensely popular, so that he was able to carry on a productive life in which frequent publication of books resulted, and he was able also to travel. One of the earliest acts of the Liberal ministry when it came again into power in Denmark in 1892 was to confer on Brandes a substantial pension for his public services, and in 1902 he was elected to the professorship of literature in the university which had remained vacant on his account for 30 years. In 1913 he visited England, where he lectured on the reciprocal influence of English and Danish literature, on such topics in philosophy as Nietzsche, whose work he did much to bring to general attention, and on such authors as Shakespeare, Voltaire, Rousseau and Hans Christian Andersen. In the following year he visited the United States. Brandes in his work and teaching constantly remained champion of individuality and self-expression, speaking plainly and fearlessly on matters of politics, churches, sociology and literature, in utterances considered revolutionary at the times when they were made. Not only was he fearless and untrammelled, but his ideas were so presented that his lectures and writings were intensely stimulating, and there were many students who derived from him their first broad conceptions of literature and philosophy, and especially of such figures as Ibsen and Nietzsche. He criticized the Danish government for its reactionary tendencies; the state church for its formalism; the university for its dogmatism and intolerance; and current literature for its ultra-romanticism and its failure to hold touch with life. As a scholar, he had derived from Germany a tendency toward excessive classification, which detracted in a measure from his writing and position as a critic, while at the same time he frequently exhibited racial and rationalistic prejudices. While he never denied his Jewish origin, he never attended the synagogue, and was alienated from the orthodox members of the Jewish race. His early criticism of the Danish Protestant church had brought him apart from that organization, and he later incurred the animosity of the Roman Catholic church; in this connection opposing women suffrage on the ground that since women attended church more than men, giving them the ballot would increase the power of the church. In connection with his feeling towards religious mat-

ters, it may be said that in 1925 he published *The Jesus Myth*. All things considered, Brandes not only was the first of Danish critics but was one of the great systematic critics of literature in modern times, ranking with such Frenchmen as Sainte-Beuve, Taine and Brunetière. He was a disciple of Comte and Taine, and of John Stuart Mill and Herbert Spencer, turning to these two English philosophers from such continental influences as those of Hegel, Spinoza and Feuerbach. Brandes was a scientific critic to whom literature was itself a "criticism of life." In reference to his work, he appraised it as follows: "My special gift is a certain creative spirit which makes of me something more than a critic. I am called a critic; that term is too small for me. I am called a philosopher; that term is too big. I am a poet, an artist, not a philosopher. I have the reward of helping to make an epoch; in my time I have inspired poets." He was honored by the degree of LL.D. from the University of St. Andrews, Scotland, and was elected to the Royal Society of Literature, the Rationalist Press Association, the Polyglot Club, and the Rationalist Peace Society of London, as well as the American Academy of Arts and Sciences, the Free Trade Association, and the Thomas Paine Association of New York. His literary output consisted of some 33 volumes of history, biography and criticism, of which the more significant are: *Ludvig Holberg* (1884); *Søren Kierkegaard* (1877); *Danish Poets* (1877); *Impressions of Poland* (1888); *Impressions of Russia* (1888); *Berlin* (1884); *Ferdinand Lassalle* (1887); *Lord Beaconsfield* (1879); *Men and Works in European Literature* (1883); *Men of the Modern Revival*; *A Study of Ibsen*; *Poems* (1896); *William Shakespeare* (1898); *Complete Works*, in 21 vols. (1910); *Goethe* (2 vols.); *Julius Caesar* (2 vols.); *The Jesus Myth* (1925); *Hellas* (1925); and *Petrus* (1926). Practically all of these have been translated into English.

BRATIANU, JON. Rumanian statesman, died at Bucharest, November 24. He was born at Florica, Rumania, Aug. 20, 1864, and was the eldest son of the late Jon Bratianu, who was premier of Rumania for thirty years, and who, with the late King Charles, was regarded as the founder of the modern Rumanian kingdom. The younger Bratianu was sometimes called "Jonel," the Rumanian diminutive of "Jon." Other members of the family, of the old aristocracy, have served Rumania with great distinction; at the death of Jon Bratianu he was succeeded by his brother, Vintila, as acting prime minister. Vintila was associated with his brother as minister of finance. Jon was prime minister of the country in 1914 at the outbreak of the World War. For two years he maintained neutrality, realizing the perilous position in which Rumania stood, in close proximity to what was then the Austro-Hungarian empire. He followed the trend of the country's feelings, however, in its ardent desire for a "Greater Rumania," and in August, 1916, Rumania entered the War on the side of the Allies. Bratianu, however, was farsighted enough to oppose the desire of the Rumanian generals for the immediate invasion of Transylvania. His objections were overborne, however, and the move resulted disastrously for Rumania, which was compelled to sign a humiliating treaty of peace with the Central Powers early in 1918. Bratianu

dissenting, and resigning as premier. Later in the year the collapse of the Central Powers freed Rumania from the onerous conditions imposed, as the victors in the war were sympathetic to her aspirations for national expansion.

Bratianu attended the peace conference, and at Paris proved himself to be a stubborn bargainer for his country. He objected strongly to the minority clauses which the statesmen of the Allies insisted on including in the treaty of peace, and believe that the sovereignty of Rumania was in some way impaired by them. He also laid claim for Rumania to the whole of the Banat of Temesvar, and when it was refused he withdrew without affixing his signature to the treaty.

Returning to Rumania, he went into opposition to the government, but in the troublous times of 1922 he emerged as the "strong man" of his country. From that time until he died Bratianu presided over the government, although strongly opposed by the National Peasants' party and others. He was in effect the dictator of Rumania, although his relations with the late King Ferdinand, who trusted him implicitly, were friendly and confidential. He was in the main reserved and suspicious, and he preferred to gain his ends by political manipulation rather than by open and ruthless displays of power. When Prince Carol, elder son of the late King Ferdinand, abjured his right of succession to the throne (after abandoning his wife) and went to Paris to live, Bratianu supported the King in his establishment of the regency, appointed in view of Ferdinand's own illness. After the death of Ferdinand, July 20, 1927, Bratianu took a strong stand against the return of Carol. (See RUMANIA.) During the periods when Bratianu was prime minister of Rumania, and at one time when he was allied with the late Take Jonescu, he initiated and carried through many reforms. Among these the most notable were the introduction of universal suffrage, the agrarian law which divided large estates among the peasants, and measures for the amelioration of the condition of the Jews of Rumania.

BRAZIL. The largest of the South American republics; situated in the northern and eastern part of the continent of South America; a federal republic. Capital and largest city, Rio de Janeiro.

AREA AND POPULATION. The area of Brazil is given at 3,285,318 square miles, which gives it an area more than 250,000 square miles greater than that of the continental United States. The country is divided into 20 states, one territory and one federal district. According to the census of 1920 the population of the republic was 30,635,605, which represents a density of 9.3 inhabitants to the square mile. The principal cities with their populations, according to the same census, are: Rio de Janeiro, 1,157,873; São Paulo, 579,033; Bahia, 283,422; Recife, 238,843; Belem, 236,402; Porto Alegre, 179,263. According to statistics furnished by the Statistical Bureau the population of Brazil on Dec. 31, 1926, totaled 36,870,972, divided among the states, territory, and federal district as follows:

Alagoas, 1,117,045; Amazonas, 409,699; Bahia, 3,859,241; Ceará, 1,520,335; Federal District, 1,360,586; Espirito Santo, 587,451; Goyaz, 640,-

491; Maranhão, 1,047,206; Matto-Grosso, 312,661; Minas Geraes, 6,902,511; Pará, 1,269,344; Parahyba do Norte, 1,193,260; Paraná, 870,255; Pernambuco, 2,617,310; Piahy, 738,740; Rio de Janeiro, 1,844,304; Rio Grande de Norte, 666,903; Rio Grande do Sul, 2,683,683; Santa Catharina, 847,656; São Paulo, 5,751,822; Sergipe, 524,095; Acre Territory, 106,374.

Santos is the leading port of Brazil for the entry of immigrants, and the state of São Paulo normally receives more than half of the total immigration into the Republic. The number of immigrants who entered the state of São Paulo during 1926 was 96,887, of whom approximately 70,000 entered through Santos, the remainder, or nearly 27,000, having been landed at Rio de Janeiro and brought to São Paulo over the Central do Brazil Railway. The total number of immigrants entered at Rio de Janeiro in 1926, according to official statistics, was 67,171, this figure presumably including the 27,000 landed for transfer to São Paulo. The immigrants who entered Rio de Janeiro comprised the following nationalities: Portuguese, 22,334; Rumanian, 9379; German, 4021; Spanish, 3156; Syrian, etc., 3123; Brazilian, 1689; the remainder being of miscellaneous origin. Portuguese and Spanish immigrants destined for Rio de Janeiro and Santos outnumber those of Italian nationality, but for the state of São Paulo the latter nationality usually predominates, the total of Italian immigrants entering the state from 1827 to 1925 having been estimated at 904,082 as compared with 353,221 Spanish and 324,096 Portuguese. It is believed, however, that the proportion of Italian immigrants in the total is now declining.

The total number of immigrants entering São Paulo in 1926 compared favorably with the leading pre-war years, and 1926 was the record year since the World War, exceeding the 1925 figures by over 23,000 people. São Paulo has for many years been giving close study to the question of immigration, and has undertaken to maintain a constant supply of agricultural labor for the coffee plantations, going as far as to provide free transportation for the workers, their families, and baggage from their homes in Europe to Brazil. The prospective colonists are passed upon by Brazilian consular officers who grant them free visas and furnish rail and ocean transportation through certain designated companies. Upon arrival of the immigrants in Brazil, the state furnishes free rail transportation to the city of São Paulo, food, lodging, and medical attention at the immigration station, where the immigrants are held until assigned to a "colony," fazenda, or to public land; and free transportation to final destination. The importance of this movement in the economy of a state such as Brazil is apparent, and the benefit to the country, as well as to the immigrants themselves and to their native countries, is obvious. A recent estimate, made by the Minister of Public Instruction and Culture of Prussia, showed that there were over 1,000,000 German settlers in Brazil in 1927.

EDUCATION. Education is free but not compulsory, except in seven states where it is both free and compulsory. According to the latest available statistics, those of the census year, 1920, there were in the various states of Brazil 21,748 primary schools with 1,249,449 pupils; 447 federal government schools, 9612 state gov-

ernment schools, 4712 municipal schools, and 6077 private schools. There were also 450 secondary schools with 48,000 pupils, and 367 professional schools with more than 37,000 students. The University of Rio de Janeiro is the only official university in Brazil.

PRODUCTION, ETC. President Washington Luis in his message read before Congress on the official opening of its session in May, 1927, gave the following statistical résumé for Brazil for the year 1926:

BRAZIL IN 1926

Items	Paper contos	Dollars
Revenues collected	1,664,582	198,085,377
Actual expenditures	1,697,251	201,972,869
Foreign debt	4,770,105	626,021,664
Internal funded debt	2,392,054	275,555,863
Floating debt	3,295,862	394,514,681
Paper money in circulation:		
Treasury and Bank of Brazil notes	2,569,304	307,545,689
Importation	2,665,000	317,135,000
Exportation	3,181,715	378,624,085
Agricultural production (1926) ..	8,100,000	963,900,000
Industrial production (1919) ..	2,989,176	798,109,992
Industrial production (estimated)	7,200,000	856,800,000
Industrial capital (1919)	1,615,156	484,646,652
Telegraph revenues	31,415	3,788,385
Telegraph expenditures	48,792	5,806,245
Postal revenues	33,543	3,992,212
Postal expenditures	89,282	4,674,553
Railway revenues	169,611	20,133,709
Railway expenditures	229,751	27,340,369

Owing to the vast extent of its agricultural area, the average holding is of large size. Only a small portion is cultivated, but statistics indicated a rapid increase in the amount which in 1923 was placed at about 175,104,657 hectares valued at 10,568,008,000 milreis. Public lands in Brazil are the property of the several states of the Federation, except in such cases where titles have been transferred to the Federal Government for special purposes. In the smaller seaboard states, such as Rio Grande do Sul, Santa Catharina, São Paulo, Rio de Janeiro, Espírito Santo and Sergipe, the greater part of desirable and accessible lands has long been private property. In the interior states, especially Matto Grosso, Amazonas, Para, Goyaz, and Maranhão, large areas of public land remain unsettled and unclaimed. Titles to privately owned land are frequently unsafe—an inevitable result of the methods of acquisition running back for hundreds of years. Thus, titles are sometimes clouded by old grants of large areas which were practically abandoned by the original grantees but who (or whose descendants or assignees) may still retain some legal rights.

The chief crop, and by far the most important commercially, is coffee, which is raised in an area covering about one-eighth of the total and comprising the four states of São Paulo, Espírito Santo, Rio de Janeiro, and Minas Geraes. Four-fifths of the world's coffee crop is grown in Brazil. The coffee exported in 1926 was valued at £70,000,000, and the total exports of the country at £94,000,000. The city of São Paulo is the coffee capital of the world, and more coffee is handled at Santos than in any other part of the globe. Much of Brazil's wealth is derived from the coffee fazendas, and the work on the fazendas attracts the majority of immigrants.

According to the *Brazilian American*, the first coffee plant was brought to Brazil by a Brazilian soldier in the service of King John V of Portu-

gal, two hundred years ago. The exact date of the introduction of coffee is accepted as May 27, 1727. In October, 1927, the second centenary coffee celebration was held in São Paulo. The following figures on the growth of Brazilian coffee production, also taken from the *Brazilian American*, are of interest in this connection:

COFFEE PRODUCTION, BRAZIL AND OTHER COUNTRIES

Years	Average annual production Brazil	All other countries
	Bags	Bags
1871-1880	3,785,000	3,925,000
1881-1890	5,628,000	4,324,000
1891-1900	7,327,000	4,425,000
1901-1910	13,750,000	3,817,000
1911-1920	18,529,000	4,518,000
1921-1925	13,227,000	6,410,000

A bumper coffee crop was expected in 1927-28, the estimate of the Coffee Institute for the amount exportable through Santos, including the production of the States of Paraná and Minas Geraes, being 15,274,000 bags. Representatives of the States of São Paulo, Minas Geraes, Rio de Janeiro, and Espírito Santo signed a new agreement on May 28, 1927, with regard to the shipping of coffee from their respective States, this agreement being subject to revision in September. Each month as many bags of coffee as were exported the previous month were to be admitted to the coffee ports of Santos, Rio de Janeiro, and Victoria, a fixed percentage of the amount to be shipped to these ports being allotted to the coffee-producing States tributary to the respective ports.

There is a large variety of other crops of which the most important are cacao, sugar, cotton, rubber, rice, tea, and tobacco. Cotton is grown in nearly all the states, but chiefly in São Paulo, Parahyba, Maranhão, and Ceará.

Coal, gold, diamonds, petroleum, monazite, manganese, platinum, copper ore, and talc are the chief mineral resources. Sufficient coal was being mined to supply about one-half the domestic needs. The forests are very extensive and an important source of wealth. Manufacturing was of practically little importance, but was increasing rapidly. The principal single industry was textiles which employs about 60 per cent of the people engaged in manufacturing. Silk manufacturing was being encouraged chiefly in the form of a government subsidy to silk cocoon producers.

In October, 1927, the U. S. Bureau of Foreign and Domestic Commerce reported that although various superficial examinations of geological structures had been made in Brazil, to determine the possibilities of the existence of petroleum deposits, there had never been competent exploration of the whole country for oil. Such an exploration necessitates the sinking of many test wells, and to do that throughout the several extensive regions in which it is reasonably considered that oil exists would cost many millions of dollars. Representatives of several foreign oil-producing companies, nevertheless, had made reconnaissances in two or three districts. So convinced were they of the existence of deposits in commercially profitable quantities that it was reliably reported that some of these companies would be inclined to expend the required funds necessary for a complete exploration if national and state laws and

regulations could be so liberalized as to give them a reasonable assurance of obtaining the fruits of their labor. They alleged that existing restrictions as to areas and as to length of term for which oil lands could be acquired were so unsatisfactory as to discourage them from projects of a serious nature.

COMMERCE. According to the *Boletim da Diretoria de Estatística Commercial* the foreign trade of Brazil for 1925 and 1926 was as follows:

EXPORTS

Tons		Contos	
1926	1925	1926	1925
1,852,642	1,924,700	3,181,715	4,021,965

IMPORTS

4,849,015	5,018,124	2,678,550	3,376,882
-----------	-----------	-----------	-----------

The average exchange for 1925 was 8.314 milreis to the dollar, and for 1926 7.001 milreis to the dollar. One conto equals 1,000 milreis.

In the autumn the U. S. Department of Commerce reported that commercial conditions had somewhat improved during the latter part of 1927 and the prospects for the closing months of the year were more favorable than during the early months. In commercial circles, however, particularly in Rio de Janeiro and São Paulo, the feeling of anxiety in face of trade stagnation continued, and business operations were still restricted to bare necessities. There was one advantage in this situation, however, that increasing restriction of imports was tending to right the Brazilian trade balance which was markedly unfavorable during the earlier months of the year, and larger coffee shipments, which could be reasonably expected during the remaining months, might help to restore the normally healthy preponderance of exports.

FINANCE. Law No. 5 of January 12, 1927, placed the budget of expenditures of Brazil for the fiscal year 1927 at 109,023 gold contos and 1,288,519 paper contos, as follows:

	Gold contos	Paper contos
Ministry of Justice and Interior	22	123,921
Ministry of Foreign Relations	6,208	4,480
Ministry of the Navy	1,400	114,127
Ministry of War	100	194,331
Ministry of Agriculture, Industry, and Commerce	548	74,102
Ministry of Highways and Public Works . . .	18,407	505,270
Ministry of the Treasury	87,338	272,288

Law No. 5127 of Dec. 31, 1926, estimated the receipts at 140,605 gold contos and 1,155,736 paper contos, giving a surplus of both gold and paper.

A decree of Dec. 18, 1926, providing for a new monetary system with the cruzeiro as the gold-standard unit, was published in the *Diário Oficial* of Dec. 23, 1926, and its regulations in the same source, Jan. 9, 1927. The cruzeiro was to be divided into centimos, and will be nine-tenths fine. The paper then in circulation, amounting to 2,569,304,351 milreis, was to be converted into gold on the basis of 200 milligrams per milreis, the method and date of conversion to be determined by an executive decree six months in advance of such conversion. The law also provided for the establishment of a stabilization bureau, with London and New

York branches, which would issue bills and have charge of the gold deposits guaranteeing the bills. The law specifies the sources of the gold reserves to be devoted to stabilization. In the latter part of the year \$36,000,000 in gold was shipped from the United States to aid in the stabilization scheme. According to these decrees the milreis will have a value of \$0.11963 in United States currency. The foreign debt at the beginning of the year was \$626,021,664; the internal funded debt, \$275,555,863; and the floating debt, \$394,514,681.

COMMUNICATIONS. The railway lines owned by the Federal Government totaled 17,957 kilometers in length (1926); of these 8726 kilometers were directly administered by the government, the balance being rented. An extension of 5310 kilometers of track was operated under concession from the Federal Government, 7369 kilometers were either owned by the states or operated under concessions granted by them. The total trackage, including the privately owned lines, was 30,636 kilometers. One of the important projects under way during 1927 was the construction of a line (meter gauge) from Juquia to Itarare, on the Sorocabana Line, and from that point to Fartura and thence to Ourinhos. Some 30 or 40 kilometers of roadbed between Itarare and Ribeirão Vermelho, in the direction of Fartura, have already been built.

It accordance with a contract with a British company, signed in April, 1926, the Railroad of Western Minas Geraes was being electrified (1927) over a section 73 kilometers long from Barra Mansa to Augusto Pestana. The section of the main line was previously expensive to operate on account of the large amount of coal necessary to provide power for the steep grades in crossing the Serra da Mantiqueira. For the same reason trains had to be made up with only a few cars, causing congestion in freight and bad connections with the Uberaba, Tres Corações-Lavaras, and Barra Mansa-Porto de Angra dos Reis lines. The electric power was to be developed from the Piloos Falls of the Bananal River, which could furnish 2400 horse power and a three-phase current of 33,000 volts. There were to be five electric locomotives and all the necessary equipment for the development of power at a total cost of £151,640 and 1406 contos. The work was to be concluded on Sept. 27, 1927, according to the terms of the contract.

The Brazilian postal service during 1926 had an income of 33,120,604 milreis and expenses amounting to 39,281,645 milreis, giving a deficit of 6,160,941 milreis, which was somewhat less than for several years past. The postal service handled 1,647,592,396 pieces of mail, as compared with 1,648,719,157 pieces during the preceding year; the 1926 figures do not include the 222,458,491 pieces handled in transit. International parcel-post packages numbered 126,136 during the year, as compared with 107,630 in 1925.

In 1925 there entered the ports of Brazil 22,504 steam vessels of 33,146,010 tons; cleared, 22,556 steam vessels of 33,228,602 tons.

GOVERNMENT. The executive power is vested in the president, who with the vice president is elected directly by the people for four years and is ineligible for reelection; and the legislative power in the National Congress which consists of the chamber of deputies and the senate, the former having 212 members elected for three

years by popular vote on the basis of minority representation, and the latter 63 members elected by direct vote for nine years, one-third being renewed every three years. The vice president is the presiding officer of the senate. President in 1927, Dr. Washington Luis Pereira de Souza (assumed office, Nov. 12, 1926); vice president, Mello Vianna.

HISTORY. In an address read before Congress on the official opening of its session in May, 1927, President Luis discussed the stabilization of Brazilian currency, economy in administration, government operation of public utilities, and plans for highway improvement and extension of aerial and radio communication. In a direct appeal for economy he stated that aside from the railways which constitute the greatest drain on public funds, the postal and telegraph departments represent a constant demand on the country's resources. The deficit in the postal service for 1926 was \$720,000 and that of the telegraph service about \$2,000,000. The deficits of the railways approximated \$7,000,000. The failure of the Federal Treasury to collect all its revenues to which it has a right was one of the principal contributing factors to the annual national deficits. Approximately 40 per cent of the country's total income is from import duties, and therefore the privileges and exemptions granted to various classes of importers seriously curtail the national income. Although the budget provides for a balance, recently increased requirements for service of the public debt would probably have the effect of increasing the expenditures of the government for 1927 considerably beyond the figures given in the budget estimates.

A subject of great interest to the President was the building of highways, and this he meant to make the keynote of his national administration, for he realized the importance of good roads in the development of a country. To this end import duties were increased on automotive vehicles, gasoline, tires, etc., that the proceeds thus obtained might be applied to the development of a highway system which would link the more important districts of central Brazil.

In reviewing the progress of the republic since its beginning in 1889, the President brought out some interesting comparisons. The population had much more than doubled, transportation facilities had increased from a negligible factor to railway and highway services of practically 1 and 1½ kilometers each, respectively, per capita. Mileage of telegraph lines had about quadrupled, and agricultural production and export trade both increased 15 or 16 fold.

In the early months of the year the revolutionary activities in the states of Rio Grande do Sul, Santa Catharina, Matto Grosso and Goyas continued and resulted in the keeping in effect of the state of martial law which the government had been forced to announce some time previous. Reports of desultory engagements continued to filter through the government censorship and such accounts as were published were, of course, always favorable to the government. No decisive action was evidently forced, the laconic ending always appearing, "the rebels were driven into the unsettled portions of the state." These government successes were followed by the lifting of the state of siege early in February, with the announcement that while some revolutionary forces still existed the government

was everywhere in control. The claim was made in certain quarters that the revolt was being financed by Russian Communistic circles. A radical law was introduced and passed to curb such activities in the country. One of the drastic provisions of this law which was signed by the President in August was the making of labor strikes illegal. Needless to say this measure and its adoption were bitterly condemned in all labor quarters.

BRETHREN, CHURCH OF THE. A church established in the United States in 1719 at Germantown, Pa. It originated in Schwarzenau, Germany, in 1708, and is the largest of the five branches of the denomination formerly known as the German Baptist Brethren or "Dunkers." Other churches of this group are: The Church of God (New Dunkards); Brethren Church (Progressive Dunkers); German Seventh Day Baptists, and Old Order German Baptist Brethren. The policy of the Church of the Brethren corresponds more nearly to the Presbyterian than to any other specific ecclesiastical form. It comprises 49 district conferences and holds a General Conference annually. Figures for 1927 showed 1040 churches and a membership of 131,648; Sunday schools numbered 1180 and scholars, 131,000. Foreign missionary work was carried on in India, China, Sweden, and Africa. The total membership in India and China was 4545 in June, 1927. Expenditures for the year ending February 28, 1927, totaled \$313,948.83. Eight colleges, one academy, and one theological seminary and training school maintained by the denomination had an enrollment of 4367 students. Officers of the General Conference in 1927 were: The Rev. J. W. Lear, Chicago, Ill., moderator; the Rev. H. K. Ober, Elizabeth, Pa., reading clerk; and I. B. Book, North Manchester, Ind., writing clerk. Otho Winger, North Manchester, Ind., was the president of the General Mission Board. The *Gospel Messenger* is the official organ of the denomination. The *Missionary Visitor* is the promotional periodical of the General Mission Board. The headquarters of the General Mission Board, General Sunday School Board and the Council of Promotion are located at Elgin, Ill., of the General Education Board, 3635 Ordway St., N. W., Washington, D. C., and of the General Welfare Board, at Warsaw, Ind.

BRETT, LLOYD M. Brigadier General, United States Army, died at Washington, D. C., September 23. He was born at Dead River, Me., Feb. 22, 1856, and graduated from the United States Military Academy in 1879, being commissioned immediately second lieutenant in the Second Cavalry. He served at various posts in the West and received the Congressional Medal of Honor for gallantry in action against Sioux Indians, Apr. 1, 1880. During the Spanish-American War and the Philippine insurrection he served with higher rank in the volunteer service, and he became colonel of cavalry in the regular army, Aug. 25, 1914. From 1903 to 1908 he was adjutant general of the District of Columbia militia, and from 1910 to 1916 he was superintendent of Yellowstone National Park. Commissioned brigadier general in the United States army, Aug. 5, 1917, he commanded the 160th Infantry Brigade, with which he served overseas until June, 1919. In the World War he was decorated as an officer of the Legion of Honor, and received the Croix de Guerre. On his return to

the United States he served as colonel of the Third United States Cavalry until his retirement from active service in 1922.

BRIAND PROPOSALS. See ARBITRATION, INTERNATIONAL.

BRIDGES. In 1927 the demands of motor vehicle highway traffic continued and as a result a number of large and important bridges were built or planned. Most of these were toll bridges and it seemed to be more generally recognized that structures of this kind should be compelled to pay their own way whether they were built as private enterprises or by local or state authorities. The matter continued to be one of general discussion although where private construction was undertaken provision usually was made for the adequate protection of the state and for the structure to revert to the state after a stated number of years, or at least under the franchise it could be acquired on specified conditions. Bridge construction was a prominent feature in the construction steel industry in the United States during 1927, the gain in bridges over the previous year being estimated at 70 per cent. American steel plants had under way six large bridges, two over Arthur Kill between New Jersey and Staten Island, one between New York City and Fort Lee, N. J., the Mid-Hudson Bridge at Poughkeepsie, N. Y., the Lehigh Valley R. R. Bridge over Newark Bay, N. J., and the Delaware, Lackawanna and Western R. R. Bridge over the Hackensack River. These six bridges alone totaled some \$45,000,000 in the year's steel construction work, but there was corresponding activity in the construction of smaller highway bridges during the year.

A few important railway bridges completed during the year shared interest with the highway structures. In many cases, however, a combined railway and highway bridge was built, vehicle traffic using an upper deck. A structure of this type was completed at Bath, Maine, across the Kennebec River, navigation being provided for by a lift span at the centre of the river. Likewise, a new bridge across the Mississippi River at Fort Madison, Iowa, built by the Atchison, Topeka and Santa Fe R. R., had the upper deck leased for a highway crossing.

HUDSON RIVER BRIDGE. This notable highway suspension bridge with a 3500 foot main span, across the Hudson River between New York City and Fort Lee, N. J., described in the 1926 YEAR BOOK, was put under construction during the year. The plans were carefully restudied and contracts were let for the west main pier, the rock cut on the west approach, the anchorage tunnels, and the cable towers and suspended superstructure. The west tower foundation consists of two separate piers, one for each tower leg, and at the end of the year one of these had been carried up nearly to water level. Each of these piers was being built in a steel sheet pile cofferdam about 100 feet square which had been excavated down to bed rock, which at this point consists of Newark sandstone and lies at a depth of 45-70 feet below the water and slopes down towards the river. When the bids for the superstructure were called for the contractors were permitted to bid alternately on eyebar and wire cable designs. As the lowest bid was for the wire cable, accordingly the contract was let on this basis. The accompanying diagrams

show this new bridge in comparison with similar structures.

STATEN ISLAND BRIDGES. Important progress was made on the two Arthur Kill Bridges between Staten Island and New Jersey, discussed in the YEAR BOOK for 1926. The cantilever spans of the Outerbridge crossing were practically completed by the end of the year. Another important bridge in this region, also to be built by the Port Authority, was the steel arch bridge of 1600 feet span across the Kill Van Kull between Staten Island and Bayonne, N. J. For this project the approval of the United States War Department had been secured as to clearances, and bonds to provide for its erection were sold. It was stated that active construction would begin in 1928.

POUGHKEEPSIE BRIDGE. During the year notable progress was made on the 1500-foot span suspension bridge to carry the State highway across the Hudson River at Poughkeepsie, N. Y. The work of the year involved the substructure, two main piers being sunk by dredging as open cylinders to depth of about 125-135 feet. At the end of December the west pier was nearly completed, while at the east pier due to the tipping after grounding of the reinforced-concrete cylinder it was necessary to carry on righting operations.

ARLINGTON MEMORIAL BRIDGE. The Arlington Memorial Bridge over the Potomac River at Washington, D. C., advanced to a point during the year where it was possible to let the contract for the construction of the reinforced concrete barrel superstructure. The pier construction was nearly completed at the end of 1927 and everything was in readiness to complete this notable structure. The Arlington Memorial Bridge was designed as a monument as well as a means of communication and is marked by costly stone facing and architectural ornament and other features. This involved a very high cost for a bridge of this size.

HAVRE DE GRACE BRIDGE. During the year the well-known Havre de Grace Bridge across the Susquehanna River on the main highway route from Philadelphia to Baltimore was reconstructed and a second deck added so that one-way traffic was carried on each deck. This bridge was built by the Pennsylvania R. R. as a single track railway bridge in 1873, and was abandoned in 1908 when the railway constructed a double track bridge. It was offered to the local authorities for a highway bridge, but the two counties concerned refused to accept the bridge. It was then given to a group of seven citizens who operated it as a toll bridge until February, 1923, when it was purchased by the State for \$585,000 and used as a toll bridge until the original cost was returned. It was found necessary to enlarge the bridge to satisfy traffic and instead of rebuilding it to give greater width it was decided to place one driveway above the other, and construct the necessary approach spans. This was done at a cost of approximately \$300,000 for providing two 12-foot roadways and approach spans, a sum that would be received in tolls within practically a year.

DETROIT-WINDSOR BRIDGE. On June 28, the final step was taken in the series of authorizations required for the execution of a toll bridge project across the Detroit River to Windsor, Ontario, to be built by a private company. At a referendum election in Detroit a vote of 66,-

000 in favor, 8000 against, was given in favor of a street crossing franchise asked by the American Transit Co. This bridge involves an 1850-foot suspension span located on a line from 21st Street, Detroit, to Huron Line Road, Windsor, Ontario, and the total cost of the enterprise was estimated at approximately \$22,000,000. The Detroit International Bridge Co. was incorporated in Michigan to take over the assets of the American Transit Co., and the Canadian Transit Co., on the two shores respectively, and, in July, \$20,000,000 of bonds were placed on the market.

The bridge was to have a total length of 7542 feet, including the main span of 1850 feet, and carry a 47-ft. roadway on a single deck. A contract was entered into for construction and work was started, so that at the end of December pier construction was in progress.

SAN FRANCISCO BAY BRIDGE. During 1927, continuing the consideration of the construction of the toll highway bridge from San Francisco to the East Bay cities, the San Francisco Supervisors decided to select the site and fix on general features of the project before deciding on the award of the franchise or on public construction. The city's board of engineers during the year recommended that the best location would be with the terminal in the city at Rincon Hill, with second choice at Hunters Point, and the third choice between Telegraph Hill and Goat Island. The city duly made application to the U. S. War Department for the approval of clearances for the bridge to be constructed at the Rincon Hill site, but the U. S. Navy Department offered objections on the ground that it would interfere with the use of the Mare Island Navy Yard and would restrict the operations of the fleet. Accordingly the application was denied by the U. S. War Department, but the city determined to take the matter up directly with Congress.

CARQUINEZ STRAIT BRIDGE. On May 21 the toll bridge across Carquinez Strait, near San Francisco, was opened to traffic, being formally

dedicated on that day. This bridge which is 4482 feet in length provides a 30-foot structure, with two sidewalks, and is located on the continuous North and South Highway. The structure consists of two main spans of 1100 feet each, making it the second largest cantilever bridge in the United States and the fourth largest in the world, being exceeded by the Queensboro Bridge in New York City with two spans of 1182 and 984 feet, respectively, and the Quebec bridge over the St. Lawrence, with a main span of 1800 feet, and the Forth in Scotland, with two spans of 1700 feet. In addition to the two main cantilever spans of 1100 feet there are two anchor arms of 500 feet and a central tower span of 150 feet, making the total length of the main span 3350 feet as compared with 3724 on the Queensboro Bridge. Each 1100 foot span consists of two cantilever arms of 333 feet, 4½ inches and a suspended arm 433 feet 2½ inches. At the other end of the bridge there is a steel viaduct approach 1132 feet in length, making the total length of the bridge 4982 feet. The double-span cantilever design was adopted in preference to a 1950 foot suspension bridge, on the score of lower cost and was duly approved by the U. S. War Department. The design of the bridge provided for earthquake resistance and involved a total of 13,294 tons of steel. The bridge apparently met a great need and on the day after opening almost \$8000 in tolls were collected on a rate of 60 cents for automobiles and 10 cents for each passenger.

INTER-CITY BRIDGE. During the year the Inter-City Bridge on the new highway between St. Paul and Minneapolis, Minn., was completed. This bridge, referred to in the YEAR BOOK for 1926, was a concrete structure with five arches, with a total length of 1521 feet. It was a bridge of attractive design and afforded much needed facilities for increasing vehicle traffic.

MOUNT HOPE BRIDGE. The legislature of the State of Rhode Island granted a franchise for a private toll bridge to connect the Island of Rhode Island with the mainland between Ports-

mouth and Bristol, and late in the year contracts were let and pier foundation work was placed under way. This was to be a suspension bridge with 120 foot main span.

RECONSTRUCTION OF HIGH BRIDGE. During the year reconstruction of High Bridge, across the Harlem River, New York City, was in active progress and this picturesque structure of Roman-type masonry art aqueduct was being rebuilt in order to provide unimpeded navigation in the channel of the river. Four of the piers of High Bridge were located in the 15-foot channel planned by the engineers of the U. S. War Department, so it was necessary to evolve virtually a new design to effect the crossing. The plan adopted was to use the steel-arch span converting two of the old masonry piers with abutments of sufficient size to carry the new arch. High Bridge consisted of 15 arch spans of granite, with a total length of 1197 feet over the abutments, there being six 50-foot arches on the Bronx shore, eight 80-foot arches, forming the original river span, and one 50-foot arch on the Manhattan shore. The eight 80-foot arches of the river span were reduced to five, by filling operations. The new construction involved the enlargement of the piers under water to form adequate supports for the arches and the removal of the piers themselves so that the new arch could be constructed. This arch has a span of 425.88 feet from centre to centre of end piers. The plan was to erect a steel arch on falsework without interfering with navigation on the river or with other traffic which the bridge crossed.

NEWCASTLE-GATESHEAD BRIDGE. The New Road bridge across the Tyne between Newcastle and Gateshead in England was under construction during the year, the abutment pieces being built and the erection of the steel span begun. This was a steel arch bridge with a span 531 feet from pin to pin, with a rise of 170 feet, affording a clear head room for ships of 84 feet and having its roadway 93 feet above high water. This roadway includes a double trolley track and provides for heavy traffic where 100 tons on four wheels is taken as the basis of loading. The arch consists of two crescent-shaped ribs at 45-foot centres connected by lateral and sway placing. Towards the abutments the roadway is carried on columns supported on the upper booms of the ribs, while in the centre it is supported by hangers from the lower booms. The approaches on each side of the bridge are carried by continuous girders at 34 feet, supported by steel columns.

SYDNEY HARBOR BRIDGE. During the year progress was made on the erection of the Sydney Harbor Bridge in New South Wales which had a total length, including approach spans, of 3770 ft., its principal feature being a single arch span across the harbor. This span has a length of 1650 feet and affords a clear headway of 170 feet at high water. From the water level to the top of the arch the height was 450 feet. Several of the approach spans on the north and south sides of the harbor were completed and work was actively in progress on the abutment towers for the main arch span. These towers are of concrete, faced with granite and have a height of 285 feet and measure at their bases 222 feet by 162 feet. At the bases of these towers the main bearings for the arch ribs, weighing 296 tons each, were placed in position and were de-

signed to take an estimated total thrust of 20,000 tons. The diameter of the main bearing pins was 14½ inches.

MAKURDI BRIDGE. Late in the year the contract was awarded for one of the longest bridges on the African continent, to be built over the Benue River at Makurdi, 290 miles inland from Port Harcourt on the Eastern Division of the Nigerian Railway. This bridge was to comprise 13 spans, with a total length between abutments of 2384 feet and was to be built within four and one-half years. The contract price was £960,504. The object of the bridge was to afford better facilities for rail and road traffic than was possible with the train-ferry service.

BAGNEUX BRIDGE. During the year there was completed at Bagneux, near Paris, what was stated to be the largest concrete bow-string girder bridge in the world, having a clear span of 286 feet 6 inches. This bridge followed an earlier structure with 180-foot span, built some years previously at Nantes, France. The bridge was of interest to engineers in view of the fact that in this type of structure secondary stresses were more important than the stresses directly produced by the vertical loading. The ribs were treated as arches permanently hinged at the springs and were of H-section with upper and lower flanges spirally reinforced. The foundations of the bridge consisted of four circular mass concrete columns which were carried down 65 feet below ground level.

INTERNATIONAL PEACE BRIDGE. On August 7 the international bridge between Buffalo and Fort Erie was formally dedicated by the meeting of the Prince of Wales and Vice President Dawes.

BRIGHAM YOUNG UNIVERSITY. An institution of higher education at Provo, Utah, founded in 1875, and maintained under the auspices of the Church of Jesus Christ of Latter Day Saints. It comprises colleges of arts and sciences, education, commerce and business administration, applied science, fine arts, and divisions of research and extension. The 1927 summer session enrollment was 426, and the fall session enrollment was about 1500. There were 90 members on the faculty. The budget for the year was \$301,000. The library contained 50,000 volumes and 45,000 pamphlets. President, Franklin Stewart Harris, Ph.D.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE. An association founded in 1831, when it first met at York, composed of 13 sections, representing all branches of pure and applied science. For the annual meeting in 1927, which was held at Leeds, August 31, to September 7, there were reported the following sections, with their presidents, who delivered addresses on the subjects named: Mathematics and Physics, Prof. E. T. Whittaker, "The Outstanding Problems of Relativity"; Chemistry, Dr. N. V. Sidgwick, "Coordination Compounds"; Geology, Dr. H. H. Thomas, "Tertiary Volcanic Activity in Britain"; Zoology, Dr. G. P. Bidder, "The Ancient History of Sponges and Animals"; Geography, Dr. R. N. Rudmose Brown, "Problems of Polar Geography"; Economics, Prof. D. H. MacGruder, "Rationalization of Industry"; Engineering, Sir J. B. Henderson, "Invention as a Link in Scientific and Economic Progress"; Anthropology, Prof. F. G. Parsons, "Englishmen of the Future"; Physiology, Dr. C. G. Douglas, "The Development of Human Phys-

iology"; Psychology, Dr. W. Brown, "Mental Unity and Mental Dissociation"; Botany, Prof. F. E. Fritsch, "Early Beginnings of Plant Life"; Education, the Duchess of Atholl, M. P., "The Broadening of the Outlook of Education"; Agriculture, Mr. C. G. T. Morison, "Agriculture in its Relation to Education."

A message from the Prince of Wales, handing over his presidency of the Association to his successor, Sir Arthur Keith, was read, in which the prince commented upon the firm foundations which were being laid for an Imperial Scientific Service and in which he announced the gift of £10,000 from Sir Alfred Yarrow, to be expended within twenty years, for the general purposes of the Association. Sir Arthur Keith delivered an address on: "Darwin's Theory of Man's Descent as it Stands To-day." An important contribution to the programme of the Association was made in the paper on "The Requirements of the Population in Milk-Fat and the Available Supply," by Dr. Cramer, based on an investigation carried out under the auspices of the Medical Research Council. Sir Arthur Keith accepted for the Association the offer of G. Buckston Browne, surgeon, of London, to purchase, restore and endow Down House, the home of Darwin, at a cost of £15,000.

It was announced that the 1928 meeting would be held at Glasgow; the 1929 meeting in South Africa. The officers elected for 1928 were: President, Prof. Sir W. H. Bragg, K. B. E., F. R. S.; General Secretaries, Dr. F. E. Smith, O. B., F. R. S.; Prof. J. L. Myres, O. B. E.; General Treasurer, Dr. E. H. Griffiths, F. R. S.; Secretary, O. J. R. Howarth, O. B. E.

BRITISH COLUMBIA. A Canadian province on the Pacific Ocean, lying between Alaska and Alberta. Area, 355,855 square miles; population, according to the census of 1921, 524,582 as compared with 392,480 in 1911. The census bureau estimate in 1925 was 560,500. The principal cities with their populations in 1921: Victoria, the capital, 38,727; Vancouver, 117,217; New Westminster, 14,495. The movement of population in 1925 was: Births, 11,604; deaths, 4812; marriages, 6792. There is a complete system of free and non-sectarian education, ranging from primary to collegiate instruction. In 1925 there were 992 elementary schools with 2916 teachers and 87,357 pupils and 71 high schools, with 378 teachers and an enrollment of 10,597 pupils. The area of the timberland of British Columbia is estimated at more than 100,000,000 acres, containing roughly 400,000,000 feet of merchantable timber. The value of lumber, lath, shingles and pulpwood in 1925 was \$81,000,000. The mineral resources are abundant. The value of the output in 1926 was \$67,718,400 as compared with \$61,492,242 in 1925. The leading mineral in value was lead. The other important minerals are coal, copper, gold and silver. For figures pertaining to agriculture and manufacturing, see CANADA.

The 1925-26 budget figures showed a revenue of \$21,775,869 and expenditures of \$21,675,076. The government is under a lieutenant-governor and a legislative assembly of 48 members elected for five years. The province is represented in the Canadian legislature by six members in the senate and 14 members in the house of commons. Lieutenant-Governor in 1927, Robert R. Bruce; prime minister and president of the council, John Oliver; provincial treasurer, minister of

mines, and commissioner of fisheries, William Sloan; agriculture, E. D. Barrow; education, finance, and industries, J. D. Maclean; public works and railways, W. H. Sutherland; attorney-general and minister of labor, A. M. Manson; lands, T. D. Pattullo.

BRITISH EAST AFRICA. A British possession covering a large area of Africa, and comprising KENYA COLONY, UGANDA PROTECTORATE, and ZANZIBAR. See these articles.

BRITISH GUIANA, gē-ā'nā. A British colony on the northeastern coast of South America, including the settlements of Berbice, Demerara, and Essequibo; bounded on the north by the Atlantic Ocean, on the east by Dutch Guiana, on the south by Brazil, and on the west by Venezuela. Area, 89,480 square miles; population, according to the census of 1921, 207,691, excluding about 9700 aborigines in the remoter districts. An official estimate of the population in 1925 placed it at 304,412. In the same year the movement of population was: Births, 10,197; deaths, 7352. The capital is Georgetown, with a population of 56,616. The chief pursuit is agriculture and the principal products are sugar, rice, and coconuts. Stock raising is of some importance. The number of cattle in 1925 was 134,629; horses, 1776; sheep, 24,399; and goats, 13,650. The mineral resources are considerable, gold, rough diamonds, and bauxite being found in large quantities. The principal exports are sugar, rough diamonds, rice, timber, and rum; and the chief imports are flour, fertilizers, machinery and hardware, and textiles. Statistics on revenue, expenditure, and trade for 1924 and 1925 are:

	1924	1925
	£	£
Revenue	1,056,238	1,096,574
Expenditure	1,065,457	1,126,394
Imports	2,744,145	2,908,434
Exports	3,898,529	3,180,706

In 1925, 3224 vessels with a total tonnage of 1,219,231 entered and cleared the ports of British Guiana. Practically all the vessels were British and Dutch. There are 97½ miles of railroads. The colony is administered by a governor, assisted by a court of policy, consisting of seven official members and eight elected members, and a combined court, containing in addition to the above, six financial members elected by the registered voters. Governor in 1927, Sir Cecil Hunter Rodwell.

BRITISH HONDURAS, hōn-dō'rās. A British crown colony on the Caribbean coast of Central America, east of Guatemala, and 700 miles west of Jamaica. Area, 8598 square miles; population, according to the census of 1921, 45,317; estimated, Dec. 31, 1925, 47,893. The movement of population in 1925 was: Birth rate, 37.27 per thousand; death rate, 21.38 per thousand; marriages, 405. In 1925 there were 69 primary schools with an enrollment of 6787. The chief pursuits are agriculture and forestry although only a small part of the land is cultivated. In the higher lands good pasturage is to be found.

The chief exports are bananas, mahogany, cedar, and other forest products, plantains, coconuts, and chicle. The chief imports are clothing, cotton and silk goods, milk, flour, machinery and hardware. The United States leads all other countries in respect both to imports and

exports. The value of imports in 1925-26 was \$4,515,119; exports, \$3,575,786. The revenue in 1925-26 was £204,997 and the expenditures, £190,847. The public debt in 1924-25 was £153,443. The tonnage entered in 1925 was 329,027 tons. The administration is under a governor assisted by an executive council of six members and a legislative council of five official and seven unofficial members. Governor and Commander-in-Chief in 1927, Maj. J. A. Burdon.

BRITISH INDIA. See, INDIA, BRITISH.

BRITISH NEW GUINEA. See PAPUA.

BRITISH NORTH BORNEO. A British colony, comprising the northern part of the island of Borneo. Area, about 31,106 square miles; population, at the census of 1921, 257,804, most of whom were Mohammedan settlers in the coast regions and aborigines in the interior, the Europeans numbering only 533. The most numerous tribes were the Dusuns (112,287), Muruts (37,447), and the Bajaus (33,070). The chief towns are Sandakan, with a population of 11,936 on the east coast and Jesselton, on the west coast.

Only a small part of the soil is arable. The principal products are: Timber, coconuts, rye, sago, gum, coffee, fruits, spices, gutta-percha, camphor, rattans and other forest products, and tobacco. Coal, iron, gold, and mineral oils are also to be found to some extent. The trade is chiefly carried on with Great Britain almost entirely through the ports of Hong Kong and Singapore. There is a railway 127 miles long running from Jesselton to Melalap, with a branch to Brunei Bay. Statistics of finance and trade for 1924 and 1925 were:

	1924	1925
	\$	\$
Revenue	371,007	399,559
Expenditure	275,601	270,022
Imports	827,662	854,899
Exports	1,301,715	2,088,800

The tonnage entering in 1925 was 381,954 tons. The territory is under the jurisdiction of the British North Borneo Company, and the administrative functions are exercised by a governor in Borneo and a board of directors in London. Governor in 1927, J. L. Humphreys.

BRITISH SOMALILAND. See SOMALILAND, BRITISH.

BRITISH SOUTH AFRICA. See SOUTH AFRICA, BRITISH.

BRITISH WEST AFRICA. The general name given to the following British colonies in West Africa; Nigeria (colony and protectorate); Gold Coast (comprising the Gold Coast colony, Ashanti, and the Northern Territories); Sierra Leone (colony and protectorate). See separate articles.

BROOKINGS INSTITUTION. An association established in 1927, in Washington, D. C., as the outgrowth of experimentation in research and training conducted there for some years by the Institute of Economics, the Institute for Government Research, and the Robert Brookings Graduate School of Economics and Government. The new institution which is an amalgamation of these three agencies is designed to cover eventually the entire range of social sciences, and to provide facilities for research and advanced research training in such subjects as economics, government administration, political relations, history, law and social organization.

It affords an opportunity for young graduate scholars to spend from one to three years in a well equipped research organization. In addition, it provides headquarters for visiting scholars from the United States and foreign countries, who come to the national capital to make use of the great amount of material available there on economics, political, historic, social, administrative, and legal problems, as found in the records of the various departments of the government. Plans have been prepared for a group of attractive buildings to serve as individual offices, statistical, conference and seminar rooms, an assembly hall and library, living accommodations and recreational and club facilities. An endowment of several million dollars has been assured for carrying on the work of the Institution. The officers of the Board of Trustees were: Chairman, Robert S. Brookings, the founder of the Institution; vice chairman, Leo S. Rowe; treasurer, Frederic A. Delano; President, Harold G. Moulton, Director of the Institute of Economics and Chairman of the Problems and Policy Committee of the Social Science Research Council.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES. An institution at Brooklyn, N. Y.; founded in 1824, composed of three divisions: Education, Museums, and a Botanic Garden. It was incorporated in its present form in 1890. Membership is open to all who are interested in any branch of science or art. The Institute is divided into the following departments, composed of members interested in a particular field: Agriculture, fine arts and architecture, astronomy, botany, dramatic art, electricity, engineering, home economics, music, pedagogy, philology, photography, physics, psychology, French language and literature. These departments conduct educational courses, addresses, lectures and concerts. A forum conducted by the departments of political science and sociology provides for the discussion of current problems. The enrollment in the School of Pedagogy in 1927 was 1600; the attendance at lectures, 295,376; and at all other activities, 961,875. The Museum of the Institute contains collections in the fields of art, ethnology, and natural science, and the Botanic Garden comprises over fifty acres. The library contained over 26,000 volumes. In 1927 the permanent funds totaled \$2,611,240.68, and those to meet current expenses, \$674,964.98. The President of the Board of Trustees was Frank L. Babbott; Director of the Department of Education, Charles D. Atkins, of the Museum of Arts and Sciences, William Henry Fox, and of the Botanic Garden, C. Stuart Gager. Headquarters are at the Brooklyn Academy of Music, 30 Lafayette Avenue, Brooklyn, N. Y.

BROWN, WILLIAM CABELL. Protestant Episcopal Bishop of Virginia, died in London, England, July 25. He was born at Lynchburg, Va., Nov. 22, 1861, and studied at the University of Virginia and at the Theological Seminary of Virginia, near Alexandria, Va., being at the latter institution 1889-91. In the latter year he was made deacon and also was ordained priest, and from 1891 to 1914 served as a missionary in Brazil, where he translated the Book of Common Prayer and the Bible into Portuguese. In 1901 he was elected missionary bishop to Porto Rico, but declined. He was consecrated bishop coadjutor of Virginia, Oct. 28, 1914, and upon the

death of Bishop Gibson in 1919 succeeded as bishop. Bishop Brown received the degree of D.D. from the University of the South, at Seawane, Tenn. He had been president of the Synod of the Province of Washington since 1920. He was a member of the Commission of the Revision and Enrichment of the Prayer Book, and was elected to the National Council of the Protestant Episcopal Church in 1919.

BROWNELL, CLARENCE LUDLOW. American author and educator, died at Jacksonville, Fla., February 2. He was born at Hartford, Conn., June 6, 1864, and was educated at the Military Academy at Stamford, Conn., and later at Harvard College and the Stevens Institute of Technology. Going to Japan, he was instructor in English and military drill in government and private schools for five years. Later he wrote extensively on Japanese and Oriental subjects, in London. Returning to America, he became associate editor of *East and West* in San Francisco, and a member of the staff of *The Clarion*. He was head master of the Dayton, Ohio, Latin School in 1909, and instructor in English and mathematics in Valparaiso University, Indiana. He also carried on social service and community survey work, studying educational systems, particularly at Gary, Ind. His health failed in 1922, and from 1925 he lived in Florida. He was a Fellow of the Royal Geographical Society and of the Society of Arts, and a member of the Japan Society of London. His writings include: *Tales from Tokio* (1900); *Hongwan-ji at Home and Abroad* (1902); *The Heart of Japan* (1902); *Japanese Wrestling* (1903); *Japanese Archery* (1903); *Japanese Swordsmen* (1903); *Europe and America in Japan*; *Japan in California* (1906); *A Pacific Pacific* (1914); *Educational Reciprocity* (1916); *Japan and America's Trade Interests* (1916); and *Japan's War Fund Limit* (1919).

BROWN UNIVERSITY. An institution of higher education at Providence, R. I.; founded in 1784. In the autumn of 1927 the enrollment was 2180, of whom 250 were graduate students; 1339 undergraduate men, including 297 seniors, 278 juniors, 311 sophomores, 428 freshmen and 25 specials; 491 undergraduate women; and 100 school of education students. The faculty of 187 included 102 professors, 45 instructors and 40 assistants. The permanent productive funds of the university amounted to \$8,759,203.83 of which \$8,248,543.53 was an endowment of the Men's College and \$510,660.30 an endowment of the Women's College, and the total income from these funds was \$456,437.01. The library contained 350,000 volumes. During the year the graduate department of the university was made a graduate school, with a dean and a registrar. A new biological annex and a new gymnasium were constructed; also a psychological laboratory to house the new psychological department, headed by an associate professor. Gifts of five fellowships, of \$1,000 each, for graduate study at Brown were announced. President, William Herbert Perry Fausse, D.D., LL.D.

BRUCKNER, EDUARD. German geographer, died May 21. He was born at Jena, Germany, in 1862, and was educated at the Universities of Dorpat and Munich. From 1885 to 1891 he was editor of the *Meteorologischen Zeitschrift*, and from 1888 to 1904 he was professor of geography at the University of Bern. In the latter year he became professor of geography at Halle, and in

1906 he went to Vienna to fill the chair in the same subject. He became editor of the *Zeitschrift für Gletscherkunde* in 1906. Among his works were: *Die Vergletscherung des Salzachgebietes*; *Klimaschwankungen seit 1700*; *Die Feste Erdrinde und ihre Formen*; *Die Schweizer Landschaft Einst und Jetzt*; (with A. Penck) *Die Alpen in Eiszeitalter*.

BRUNEI, brōō-nī. A British region on the northwestern coast of the island of Borneo. Area, about 2500 square miles; population, according to the census of 1921, 25,444, of whom the Europeans numbered only 35, the bulk of the population being made up of Malays and native Borneans. Brunei is the chief town with a population of about 10,000. Among the principal products may be mentioned mangrove extract, rubber, coal, sago and jelutong. Cloth-weaving, silverware, brass-founding, and boat building are found among the native industries. In 1925 the chief exports were cutch, coal, rubber, jelutong, and forest products; the chief imports, rice, tobacco, kerosene oil, piece goods and sugar. The revenue in 1925 was £36,782; expenditure, £28,616; public debt, Dec. 31, 1925, £50,167. The administration is in the hands of a British Resident, the sultan retaining the name only and with his two principal ministers receiving a subsidy from the British government. Sultan in 1927, Ahmed Tajudin Alkhasul Khairi Waddin, a minor, who succeeded his father in September, 1924. British Resident, O. E. Venables.

BRUSHINGHAM, JOHN PATRICK. American Methodist clergyman, died at Chicago, Ill., April 7. He was born at Cuba, N. Y., Feb. 16, 1855, and graduated from Northwestern University in 1881, taking the degree of bachelor of divinity in 1883. He had begun preaching in Chicago in 1875, and was pastor of the Ravenswood Church until 1884. He was ordained to the Methodist ministry in the following year. He was pastor of various churches in and about Chicago, and became secretary of the Morals Commission of Chicago in 1917. Three times he was a member of the General Conference of the Methodist Episcopal Church, and he was also a member of the Methodist Ecumenical Conference, London. He was at one time president of the Chicago Methodist Social Union, and was a member of various civic and charitable organizations. He wrote: *Catching Men* (1906); and *Spiritual Electricity* (1911).

BRYAN, CHARLES W. American engineer, died at New Rochelle, N. Y., June 25. He was born at Washington, Mo., May 5, 1863, and in 1884 graduated in civil engineering from Washington University, St. Louis, Mo. After serving as a draftsman and as an engineer in the bridge department of the Missouri Pacific Ry., he became permanently connected with the Edge Moor Bridge Works of Wilmington, Del., being chief engineer of that company until it became part of the American Bridge Company, of which he was chief engineer also. At that time he went to Pittsburgh in charge of contracting for railroad and highway bridges in that district, and in 1901 went to New York as eastern division contracting manager. In February, 1911, he was appointed chief engineer of the American Bridge Company, being actively interested in the design and construction of the Hell Gate Bridge and the Philadelphia-Camden Bridge.

BRYAN TREATIES. See **ASSOCIATION, INTERNATIONAL**.

BRYN MAWR COLLEGE. An institution for the higher education of women at Bryn Mawr, Pa.; founded in 1880. The enrollment for the autumn of 1927 totaled 498, of whom 385 were undergraduates, distributed as follows: seniors, 86; juniors, 66; sophomores, 112; and freshmen, 118; 3 were hearers; 20 resident fellows, and 93 graduate students. The teaching staff numbered 67. The productive funds of the college amounted to \$8,400,000 in the autumn of 1928, and the income for the year 1925-26 to \$963,459. The number of volumes in the library was 116,492. President, Marion Edwards Park, Ph.D., LL.D.

BUBONIC PLAGUE. South Africa was experiencing a plague problem which was the subject of an editorial in *The Lancet* (London) for July 9, 1927. Up to 1899 the disease had never obtained a foothold in the Union of South Africa, but in 1901 an epizootic occurred among the rats of the Cape Town docks and since that time the plague has been endemic. Recently the South African Institute of Medical Research and the Public Health Department of the Union published exhaustive reports on the past and present aspects of plague. During the period 1916-1920 there were outbreaks of the disease in the midland districts of the Cape which could not be connected with other foci of the disease, nor was the mode of propagation apparent; and it was not until 1921 that certain rodents native to this area were found to act as reservoirs for the dissemination of the disease. Two species of these rodents are the gerbille and the multimammate mouse and later three others were added—the large-eared mouse, striped mouse and ground squirrel. In 1923-24 an extensive epidemic broke out in the Orange Free State, in which 329 people were attacked with a death rate of nearly 60 per cent, about 12 per cent of the victims having the pneumonic form of the disease. The rodents in this area were almost exterminated and in addition to the smaller animals large rodents including hares and also the mongoose were sufferers. It is extremely fortunate that most of the rodents avoid the homes of the farmers and herdsmen, while the familiar house rodents from this or other cause chiefly escape infection. One reason for this immunity was probably to be found in the habits of the fleas, for the species which are parasitic on the wild rodents spare the domestic forms. Carnivora such as the mongoose and suricate contract the disease when they attack the infected rodents, flea transmission being unnecessary to explain their contamination.

BUCKNELL UNIVERSITY. A coeducational Baptist institution of liberal arts at Lewisburg, Pa., founded in 1846 under the name of the University of Lewisburg, but renamed in 1886 in honor of its benefactor, William Bucknell. In the autumn of 1927 the enrollment was 1102, of whom 886 were men and 416 were women. Of the 333 students enrolled in the summer session of 1927, 167 were men and 166 were women. The faculty had 63 members. The productive funds amounted to \$1,300,000, and the income for the year to \$554,000. A dormitory to accommodate 170 women, and the Ziegler Memorial Infirmary, a gift of Mrs. Ziegler, in memory of Dr. S. Lewis Ziegler, of Philadelphia, were completed during the year. The library contained 50,900 volumes. President, Emory W. Hunt, Ph.D., LL.D., D.C.L.

BUCKWHEAT. The production of buckwheat in the United States in 1927, according to estimates published by the Department of Agriculture, amounted to 16,182,000 bushels on 832,000 acres, the rate per acre being 19.4 bushels. As compared with 1926 this represented an increase of 3,506,000 bushels in yield, 138,000 acres in area, and 1.1 bushels in the rate per acre. On the basis of the average farm price of 83.5 cents per bushel on December 1, the total value of the crop of 1927 was \$13,518,000, or \$2,355,000 more than the crop of 1926 with a corresponding price of 88.2 cents per bushel. The yields of the leading producing States in 1927 were as follows: Pennsylvania 4,935,000 bushels, New York 4,473,000 bushels, Minnesota 1,764,000 bushels, West Virginia 880,000 bushels, Michigan 689,000 bushels, and Ohio 588,000 bushels. All others of the 23 reporting states produced less than 500,000 bushels. The average yields per acre by states ranged from 13 bushels in Iowa to 26 bushels in Vermont, and the average price per bushel on Dec. 1, 1927, from 64 cents in South Dakota and North Dakota to \$1 in North Carolina. Exports of buckwheat from the United States amounted to about 66,000 bushels in each of the years ended June 30, 1926, and 1927, and the imports to 4,033,000 and 4,016,000 pounds respectively.

BUDGET CONTROL, MUNICIPAL, BY STATE. See MUNICIPAL GOVERNMENT.

BUILDING. In 1927 the total volume of construction throughout the United States was estimated at a little over \$6,800,000,000, or a loss of 3 per cent from the figures of 1926 which were highest in the history of the United States. According to the statistics of the F. W. Dodge Corporation, the contracts let on new buildings and engineering work in the 37 States east of the Rocky Mountains in 1927 amounted to \$6,303,055,100, or a drop of 1 per cent from the record figures of 1926 and an increase of 5 per cent over 1925. At the end of the year there was a drop in the amount of new construction started in December from the record of the previous year.

BUILDING AND LOAN ASSOCIATIONS. See COOPERATION.

BULGARIA. A constitutional monarchy in the Balkans lying to the south of Rumania and the east of Jugo-Slavia. Capital, Sofia.

AREA AND POPULATION. As a result of the World War, the area of Bulgaria was reduced from 53,305 to 39,814 square miles. The population according to the census of 1926 was 5,483,125 as compared with the actual population, according to the census of 1920, of 4,846,971. The chief cities with their populations, according to the 1926 census are: Sofia, 213,120; Philippopolis, 84,891; Varna, 60,761; Ruschuk, 45,672; Slivno, 29,280; Plevna, 29,058; Stara Zagora, 29,015; Choumen, 25,314; Burgas, 31,363.

EDUCATION. Primary instruction is free and compulsory for children between the ages of seven and 14, and is supported by the state authorities. In 1925 there were 4110 national elementary schools with 13,273 teachers and 416,272 pupils and 1652 private elementary schools with 2608 teachers and 83,014 pupils. Secondary and higher schools are gymnasiums and progymnasiums, and various institutions for special training and instruction of teachers. The state university at Sofia had 287 professors and teachers and 2697 students in 1926. There is also a

free (private) university with 42 teachers and 2130 students.

PRODUCTION. Agriculture is the principal occupation of the people. The land is held in absolute freehold, the greater part of the holdings being under small proprietors (one to six acres). The methods of cultivation are primitive, although in recent years some farm machinery has made its appearance. About two-thirds of the people are engaged in cultivating the 9,182,409 acres of land under crops. Provisional results of the 1926 harvests indicated a smaller yield than for 1925. This poorer showing was attributed in part to damage sustained from the drought and floods during the year. Wheat, the leading cereal, declined in production from 1,363,000 tons in 1925 to 1,124,000 tons in 1926, although the sown acreage was about 19,000 hectares more than during the preceding year. Lower yields were reported for all other cereals, with the exception of corn. The corn yield was placed at 737,000 tons as compared with 715,000 tons in 1925, in spite of a decrease of 25,000 hectares in sown acreage. Tobacco production in 1926 was estimated at 26,450,000 kilos, and was reported to be of good quality. This compares with 45,000,000 kilos in 1925. The smaller

underdeveloped. The total coal production in 1925 was 1,219,570 metric tons. Manufacturing is also rather backward, although the government encourages industrial enterprises.

PRODUCTION OF CEREALS IN BULGARIA, 1926 *

Cereals	1926 ^a	
	Acre Acres	Yield Tons
Wheat	2,585,208	1,124,000
Rye	426,322	193,500
Meslin	228,722	76,700
Barley	534,261	250,800
Oats	400,387	154,600

Rice	11,609	7,000
Total	5,614,063	2,549,400

* Preliminary figures.

COMMERCE. According to the U. S. Bureau of Foreign and Domestic Commerce, the trade balance for 1926 was again unfavorable, but the excess of imports over exports was considerably less than in 1925. This reduction from 1,648,875,095 to 628,781,731 leva was achieved by decreased imports of textiles and their manufactures, and cereal and grain products. The latter was made possible by a better harvest.

FOREIGN TRADE OF BULGARIA FOR 1925 AND 1926

Commodity	1925		1926	
	Quantity	Value Million leva ^a	Quantity	Value Million leva ^a
IMPORTS

* The lev had an average exchange value of \$0.0073 in 1925 and \$0.0072 in 1926.

crop in 1926 was said to be due to the government's desire to improve the quality of the product. The rose crop was estimated at 6,000,000 kilos, or 10 per cent larger than in 1925, while the attar distilled was placed at 1640 kilos. The accompanying table shows the acreage and yield of the cereal crops in 1926.

Fruit is raised in large quantities especially around Kustendil; the wine production in 1924 was 16,720,000 gallons. Cotton was grown on 5650 acres in 1925 and the yield was 560,000 kilos. Honey and sugar are also produced to some extent. The minerals are rich but considerably

Germany was the chief country of origin for imports, furnishing 21.9 per cent of the total, followed by Italy with 13.8 per cent, Czechoslovakia with 12 per cent, England with 11.3 per cent, and Austria with 8.7 per cent. Exports were consigned principally to Germany, 19.5 per cent; Greece, 17.4 per cent; Italy, 12 per cent; Austria, 7.6 per cent; and Czechoslovakia, 7.3 per cent. Imports from the United States in 1926 were valued at 85,894,000 leva, as compared with 229,277,000 leva in 1925, when the total was swelled by emergency purchases of cereals. Imports from the United States consist chiefly of machines and implements, mineral

ils, gums, metals, and manufactures. Exports to the United States totaled 95,635,000 leva in 1926, as against 90,660,000 leva in 1925. The chief items were attar of roses, skins, hides and furs, and copper matte.

FINANCE. Preliminary results of the 1925-26 fiscal year showed receipts of 6,355,292,000 leva and expenditures of 6,444,617,000 leva or a deficit of 89,325,000 leva. The budget for the fiscal year 1927-28 shows a slight increase in totals or both receipts and expenditures over the previous year. Receipts for 1927-28 are estimated at 6,993,100,000 leva and expenditures at 6,992,777,000 leva, as compared with 6,924,000,000 leva and 6,924,161,000 leva, respectively, for 1926-27. Indirect taxes, which have consistently shown larger returns, are less, while increases are anticipated from direct taxes. Due to general business stagnation, government revenues during 1926-27 were expected to be below budget estimates. Under these conditions the larger revenues proposed for 1927-28 appeared to anticipate an improvement in the general business and financial situation of the country. Extraordinary budgetary credits to supplement the ordinary budget for 1926-27 totaled 169,525,720 leva. These credits were to be covered by the savings from the regular 1926-27 budget.

The most important financial event of the year was the granting of the so-called "refugee loan" to Bulgaria, under the auspices of the League of Nations. While this loan was not really an ordinary financial transaction, being designated for refugee settlement work, it was the first loan obtained abroad since the armistice, and created a more optimistic tone in business and financial circles. The granting of this loan, which was estimated to net about £2,250,000, was made contingent upon a revision of the statutes of the National Bank of Bulgaria, which became effective Jan. 1, 1927. Under the new regulations one of the chief functions of the bank is to maintain a stable currency; it is also to have the exclusive right of issuing bank notes, and will be subject only to a small degree of control by the government. Advances by the bank to the state in the future are limited to urgent needs, the maximum not to exceed 300,000,000 leva.

COMMUNICATIONS. All railways in Bulgaria are owned and operated by the State under the title "Bulgarian State Railways" with the exception of 30 kilometers of Decauville line owned by timber companies. During the fiscal year 1925-26, there were in operation 2297 kilometers of broad-gauge line and 429 kilometers of line less than four feet in gauge. The estimated receipts from all sources for the fiscal year 1926-27 and 1927-28, as compared with the actual receipts for the year 1926-27, are shown in the following table:

Rolling stock in service in 1926 consisted of 406 locomotives, 430 passenger cars, and 6578 freight cars. The average capacity of the latter was about 15 metric tons. Rebuilding of certain lines progressed slowly during 1926, the greatest amount of work being done on the Sofia-Rustchuk line. This consisted chiefly in relaying track and strengthening bridges. A great deal of work was needed to put the State Railways in good condition, but money was lacking for the purpose.

GOVERNMENT. The King is at the head of the government, assisted by a council of ministers nominated by him and a single legislative chamber known as the Sobranje composed of 227 members. In 1927 the King was Boris III, who succeeded to the throne upon the abdication of his father, Oct. 3, 1918. The parties in the Sobranje, elected in 1923, were distributed as follows: Government coalition, 172; Socialists, 29; Agrarians, 18; Communists, 8. The ministry as organized at the beginning of 1926 was as follows: Premier and Minister of Interior, André Liaptcheff; Education, N. Naidenoff; Justice, Dr. Kuleff; Commerce, M. Bobotchevsky; Finance, V. Molloff; Public Works, S. Vassileff; Posts and Railways, K. Georghieff; Foreign Affairs, A. Buroff; Agriculture, D. Christoff; War, General I. Volkoff.

HISTORY. The entire year was one of unusual quiet throughout the entire country and compared most favorably with other post-war years, when Bulgaria was in continual diplomatic hot water with her neighbors, Greece, Yugoslavia, and Rumania. The Bulgarian government was accused of terrorism by M. Vandervelde of Belgium at a meeting of the League of Nations, when he suggested amnesties for political prisoners in return for the League's loan of \$11,000,000 to help settle the Macedonian refugee problem. At the suggestion of Sir Austen Chamberlain no official action was taken in the matter on the grounds that it was a domestic affair of Bulgaria's and did not come within the purview of the League of Nations.

Towards the close of the year relations with Yugoslavia were strained to some extent because of the depredations of the so-called Komitadji, as the Macedonian revolutionaries are termed. In the last few years, in an attempt to embroil the Bulgarian government with its neighbors, they have crossed the border of the countries mentioned above and carried out depredations and then retired to the mountain fastness of Bulgaria from which neither the Governments of Bulgaria or its neighbors have been able to dislodge them. Yugoslavia demanded a satisfactory reply from Bulgaria because of the raids. The Belgrade press was open in certain quarters in its charges that Italy was financing the raids with the hopes of stirring up a war

REVENUES OF BULGARIAN STATE RAILWAYS

Item	1926-27		1927-28
	Estimated Leva	Actual Leva	Estimated Leva
Passenger, freight, and parcels service	1,050,000,000	809,297,885	1,125,000,000
Rents of property and equipment	15,000,000	10,612,698	5,000,000
One-half of 1 per cent of employees' salaries retained for medical assistance	2,000,000	1,185,697	2,000,000
Port and light charges	85,000,000	26,778,508	85,000,000

Total	1,152,000,000	847,806,788	1,174,000,000

in the Balkans from which she might emerge with increased political prestige and territorial aggrandizement. France and Great Britain, as stated under Albania (q.v.) were loath to open up a discussion of the entire Balkan question for fear of the consequences. On October 11, the Bulgarian government gave what was apparently a satisfactory reply to the Jugo-Slav note and established martial law in the infested districts, established courts-martial to try suspects, and sent troops to prevent bands from crossing in either direction. Despite these precautions, further raids were reported in the fall, and, as one observer remarked, there were more causes for actual war than had motivated Balkan states on previous occasions. The Belgrade government down to the close of the year acted with a forbearance and evident desire to promote peace which should be lauded everywhere.

BULLARD, WILLIAM HANNUM GRUBB. American naval officer and radio executive, died November 24, at Washington, D. C. He was born at Media, Pa., Dec. 6, 1866. After graduating from the U. S. Naval Academy in 1886, he served through the various grades until he reached the rank of rear admiral in 1919. He served in the Spanish-American War as a lieutenant on the cruiser *Columbia*. From 1905 to 1907 he was navigating officer of the battleship *Maine*, and then was placed in charge of organizing the work in electrical engineering at the Naval Academy. After another year at sea, in command of the cruiser *San Francisco*, in 1911 he was brought ashore to take charge of the naval radio communications work, then just becoming an important branch of the service. In 1912 he became superintendent of the naval radio service, and acting in that capacity he seized in 1915 the important wireless station at Sayville, N. Y., after President Wilson had declared that its further use by the Atlantic Communication Company would constitute a violation of the neutrality of the United States. In the following year Bullard, then a captain, commanded the battleship *Arkansas*; when the United States entered the war in 1917 that vessel was first attached to the British Grand Fleet, and was subsequently ordered to the eastern Mediterranean. The end of the war found Bullard there, and he received the formal surrender of the Austro-Hungarian navy.

Later he served on the inter-allied commission at Malta, and also went to Paris to attend the inter-allied conference on radio. After the signing of the peace treaties he was ordered to the command of the Yangtze patrol, in China. He retired from the navy in 1922 and went to live at his home at Media, Pa. In March, 1927, Admiral Bullard was called from retirement to serve as chairman of the United States Radio Commission. He had been instrumental in the organization of the Radio Corporation of America, and served on the board of directors of the corporation. He was connected actively with the development of radio for more than twenty-five years. He probably contributed more than any other man to the success of radio in the United States, and was called sometimes "the Father of American radio." At the time of his death he represented the United States at the International Radio-Telegraphic Conference in Washington.

Admiral Bullard received the Distinguished Service Medal for his work in the World War,

and was a Commander of the Legion of Honor of France and a Knight of the order of Polonia Restituta, of Poland.

BURCHARD, ANSON WOOD. American engineer, died in New York, January 22. He was born in Hoosick Falls, N. Y., Apr. 21, 1865, and was graduated from Stevens Institute of Technology in 1885. In 1902 he became connected with the General Electric Company, and for a time was active in the consolidation of several of its manufacturing units and in the development of various public utility companies. During the World War he served as assistant director of munitions, and in 1922 became vice chairman of the board of directors of the General Electric Company, of which for many years he had been vice president. He was chairman of the board of directors of the International Electric Company, in general charge of the export business of the corporation. In October, 1926, he was elected president of the American Arbitration Association. He was treasurer of Stevens Institute of Technology and a director in many public utility corporations, besides being a member of leading engineering societies in the United States and Great Britain.

BURGOYNE, SURRENDER OF. See CELEBRATIONS.

BURMA. The largest and most easterly province of British India; since 1923, a governor's province under the Government of India Act of 1919. Area, 262,732 square miles; population (1921), 13,212,192. Rangoon, with a population of 341,962, is the capital of Lower Burma; and Mandalay, with a population of 148,917, is the capital of Upper Burma. Politically Burma is a province of British India, but geographically and socially it may be regarded as a separate unit having little in common with India proper. Being almost entirely agricultural, it does not share the rest of the country's industrial ideas. Such industries as Burma has are those essential for the preparation of its products for the market—rice mills for husking rice, saw-mills for squaring its teak, refineries for oil, and cotton gins. Rice mills alone make up about three-fifths of its total industrial activity. The principal crop is rice, two-thirds of Burma's agricultural area being given to its culture. In poor years most of the crop is consumed locally, leaving but little surplus for export.

The government is administered by a governor and legislative council. Governor in 1927, Sir Spencer Harcourt Butler.

BURN, THE VERY REV. ANDREW EWBANK. British clergyman and author, dean of Salisbury, died at London, November 28. He was born at Bareilly, India, Jan. 17, 1864, and was educated at Clifton College, at Charterhouse and at Trinity College, Cambridge University. He was ordained in 1887 to the curacy of St. Cuthbert's, Gateshead, and after serving as curate and rector of various churches was collated to a prebendal stall in Lichfield cathedral in 1903. He took his D.D. degree at Trinity in 1904, and in 1906-07 was select preacher at Oxford University. From 1918 to 1920 he was chaplain to the King; in the latter year he became dean of Salisbury. Dean Burn was active in social work, and he was deeply interested in the origin and history of creeds. He wrote: *The Athanasian Creed and Its Early Commentaries; An Introduction to the Creeds and the Te Deum; Niceta of Remesiana, His Life and Works; The*

Crown of Thorns; The Council of Nicæa; The Te Deum and Its Author.

BURNHAM, CLARA LOUISE. American author, died at Bailey Island, Casco Bay, Me., June 21. She was born at Newton, Mass., the daughter of Dr. George F. Root, a composer. Moving to Chicago in her childhood, she married when very young. She wrote many stories and poems for magazines and the texts for her father's cantatas. Her novels include: *Dr. Latimer* (1893); *The Right Princess* (1902); *Jewel* (1903); *Jewel's Story Book* (1904); *The Opened Shutters* (1908); *The Leaven of Love* (1908); *The Inner Flame* (1912); *The Right Track* (1914); *Instead of the Thorn* (1916); *Hearts Haven* (1918); *In Apple Blossom Time* (1919); *The Keynote* (1921); *The Queen of Farrandale* (1923); and *The Lavarous* (1925). She was successful in depicting New England characters. She was a Christian Scientist, and most of her books are permeated with the principles of that faith.

BURTON RESOLUTIONS. See ARBITRATION, INTERNATIONAL; PEACE AND PEACE MOVEMENTS.

BURY, JOHN BAGNELL. British historian and regius professor of modern history at Cambridge University, died at Rome, Italy, June 1. He was born in County Monaghan, Ireland, Oct. 16, 1861, and after receiving his early education at home and in a local school entered Trinity College, Dublin, attaining the highest honors in classics and receiving the degree of B.A. in 1882, becoming fellow of Trinity College in 1885. Having studied under Professor Mahaffy, he devoted himself to late Roman history, and in 1889 published *A History of the Later Roman Empire from Arcadius to Irene, 375-800 A.D.* Previously he had collaborated with Professor Mahaffy in a school edition of Euripides' *Hippolytus*, and later he prepared the notes and renderings of Pindar's *Nemean Odes* (1890) and *Isthmian Odes* (1892). In 1893 he was appointed professor of modern history in the University of Dublin, combining this chair with that of regius professor of Greek, 1898-1902, and serving until the death of Lord Acton in 1902, when he was called to the professorship of modern history in Cambridge University. He resigned his fellowship in Trinity College, Dublin, in that year, and in the following year was elected fellow of King's College, Cambridge. He was also an honorary fellow of Oriel College, Oxford, and fellow of the British Academy and corresponding member of many European and American learned societies. He received the honorary degree of Litt.D. from the Universities of Oxford, Durham and Dublin, and that of LL.D. from Edinburgh, Glasgow and Aberdeen. His last important work was in two volumes entitled *A History of the Later Roman Empire from the Death of Theodosius I to the Death of Justinian* (1923), which was a continuation of his earlier history. Professor Bury was considered one of the most learned and accomplished scholars of his age, and in addition to the works mentioned his writings include: *Student's History of the Roman Empire from Augustus to Marcus Aurelius* (1893); *History of Greece to Death of Alexander the Great* (1900) (library edition, 2 vols. 1902); *The Science of History* (inaugural lecture) (1903); *Life of St. Patrick and His Place in History* (1905); *The Ancient Greek Historians* (Harvard Lectures) (1908); *The Constitution of the Later Roman Empire*

(Creighton Memorial Lecture) (1909); *Imperial Administration in the Ninth Century* (1911) *Romances of Chivalry on Greek Soil* (Romane Lecture) (1911); *History of the Eastern Roman Empire, 802-867* (1912); *History of Freedom of Thought* (1913); and *The Idea of Progress* (1920).

BUSH, BENJAMIN FRANKLIN. American railway president, died at St. Louis, Mo., July 29. He was born at Wellsboro, Pa., July 5, 1860 and was educated at public schools and the State Normal School at Mansfield, Pa. He began railway service on the Northern Pacific R. R. in 1882 as a rodman, and five years later became division engineer of the Union Pacific R. R. in Idaho and Oregon, serving until 1889, when he became chief engineer and general superintendent of the Oregon Improvement Company at Seattle, Wash. From 1896 to 1903 he was general manager of the Northwestern Improvement Company at Roslyn, Wash., and in 1903 became fuel agent of the Missouri Pacific R. R. with headquarters at St. Louis. In 1907 he was elected president of the Western Maryland Ry., serving as its receiver, 1908-10, and again as president, 1910-11. On May 1, 1911, he was elected president of the Missouri Pacific R. R., serving until 1915, when for two years he acted as receiver, becoming president again in 1917, and holding this position until his retirement. He became chairman of the board of directors which position he relinquished in June, 1924. He also acted as president of the Denver & Rio Grande R. R. from January, 1912, to November, 1915, and as president of the Western Pacific Ry. from July, 1913, to November, 1915. From June, 1918, to March, 1920, he was regional director of the southwestern region of the United States Railroad Administration. He was a member of the board of directors of the American Railway Association, and in 1900 served as consulting engineer to the United States Geological Survey. In 1907 he was appointed by President Roosevelt a member of the advisory board on fuels and structural materials. After his retirement from active railroad management he was engaged in banking and in farming near St. Louis.

BUSINESS REVIEW. The history of business in the United States during 1927 was characterized by recession and loss of ground in nearly all branches. This was apparently not due to any generally adverse condition but was the outcome of a combination of special factors. Business in 1926 had been conducted on an uncommonly high level of volume with exceptionally heavy production in basic lines and consequently large turnover. This was in some measure due to consumptive demand which had never been fully satisfied, since the period of retardation which had come on during the war as, e.g., in commercial and domestic building. In part the great upward movement which culminated in 1926 was the outgrowth of the new methods of distribution and financing; e.g. the instalment plan of selling. The net result was to advance general turnover to a high level which could not be maintained and consequently underwent reaction in 1927. The accompanying table is useful as reflecting the situation of industrial production during the past few years and consequently as illustrating the downward movement observable during 1927, especially during the second half of the twelve months.

INDUSTRIAL PRODUCTION

[Index numbers, adjusted for seasonal variations.
1923-1925 average = 100]

Month	1922	1923	Total		1925	1926	1927
January	73	100	100	105	108	107	107
February	76	100	102	105	107	109	109
March	80	103	100	104	107	111	111
April	77	107	95	108	107	108	108
May	81	107	89	108	106	111	111
June	86	105	85	102	107	108	108
July	86	108	83	108	107	106	107

December	100	96	101	108	105	99	99
Annual index ...	85	101	95	104	108

What was thus true of production was also true of distribution for, as things stood in the United States at the end of the year, there was comparatively little tendency to the accumulation or hoarding of goods. The year opened with relatively small stocks of most classes of raw materials on hand, and it closed with very little increase of such stocks. The movement of production therefore may be taken as corresponding roughly to the movement of business in the broader sense of the term. Retail trade indeed showed a reasonably steady volume of sales throughout the year, but it should of course be remembered that retail conditions are subject to something of a "lag" as compared with wholesaling or production. Still, toward the end of the year and particularly during the autumn, there was a tendency among selling indexes to decline, not only below the indexes of earlier months, but also below corresponding indexes of 1926, thus reflecting the same general tendencies toward loss of ground which had already been noted in production.

COMMODITY PRICES. The situation at the beginning of 1927 as regards commodity prices practically reflected a further recession as compared with former years, and, as 1927 advanced, this tendency to decline continued to show itself, although very moderately, up to early autumn. During the autumn months, a slight upward tendency began to develop, with the result that prices at the close of the year had practically recovered to the same point that they had reached at the close of 1926 with an average figure of about 98 (taking the average of 1926 as 100). The month of December showed another slight downward trend. Actual index numbers may be presented as follows (using U. S. Bureau of Labor returns):

MOVEMENT OF WHOLESALE PRICES

1926		1927	
January	104	January	97
February	102	February	96
March	100	March	95
April	100	April	94
May	101	May	94
June	101	June	94
July	100	July	94
August	99	August	95
September	100	September	97
October	99	October	97
November	98	November	97
December	98	December	97

Analyses of the price situation indicated that the most important factor in bringing about the stronger tendency of prices during the closing

months of the year was to be found in the changing position of agricultural commodities. As is well known, the farmer had ever since the post-war slump of 1921, suffered from a relatively low price level for the principal products of the farm, the average agricultural price index being 20 to 45 points below that for manufactures.

During the year 1927, various influences tended to bring about a better adjustment of supply and demand in agriculture, with the result that agricultural prices were decidedly "marked up." This mark-up offset some tendencies to decline that had been exhibited in a few manufacturing lines, and operated to raise the whole level of prices very slightly, as just stated. Taking the average of all commodities, the price level for the year was thus characterized by rather exceptional stability, with corresponding advance of certainty in business.

MANUFACTURING. Under the influence of the conditions already described, manufacturing, generally speaking, tended to be distinctly less active than in 1926. This was indicated by an increasing percentage of unoccupied plant capacity, particularly in basic industries like steel and iron which made a rather poor showing for the year. Automobile production was also unsatisfactory, partly due to the saturated condition of demand, but particularly to the fact that competitive conditions had compelled the largest single producer to suspend operations very largely while he was engaged in reorganizing his plant and in developing a new "model." As a result, total output of automobiles was only about 3,530,000 as compared with 5,500,000 during 1926. (See AUTOMOBILES.)

Relative inactivity was also to be noted in a number of other branches of business, especially in the textile trades, while a good many factors in the food industries found conditions difficult and buying rather reduced in activity. The outcome of these conditions was naturally a lessened demand for labor with broader unemployment. Indexes of payrolls showed steady decline as compared with 1926, differences running from 3 to 10 points or more (on a scale of 100), while numbers employed tended to shrink during the year and were steadily below figures for 1926 by 3 or 4 points.

AGRICULTURE. Agriculture enjoyed an unusually satisfactory year. The total value of 50 principal crops as estimated by the U. S. Department of Agriculture was about \$8,500,000,000, an increase of about \$635,000,000 over 1926. (See AGRICULTURE.)

The farm values of principal crops were officially given as follows:

Corn	\$2,014,725,000
Wheat, winter	645,901,000
Wheat, spring	329,603,000
Oats	587,216,000
Rye	49,945,000
Cotton	1,258,998,000

Special attention in the agricultural history of 1927 should be given to the cotton crop which, with a yield of about 13,000,000 bales or 5,000,000 less than in 1926, proved on the whole to be a good deal more remunerative to the planter than in former years. The price which had ruled at the beginning of January around thirteen cents for fair, middling, upland in the New York

market was twenty cents at the close of the year and had at times been very materially higher. (See *COTTON*.) Wheat, which at one time had seemed to be suffering from unfavorable weather, finally furnished a total yield of 319,000,000 bu. of spring and 552,000,000 bu. of winter wheat, a respective increase and decrease as compared with 1926 of 114,000,000 bushels and 74,000,000 bushels while the price was steady. (See *WHEAT*.)

The improvement in the agricultural situation was an important factor in business outlook and was generally so accepted by members of the business community. Specifically it had the result of improving the demand for goods in many parts of the country and it also tended to bring about a better banking situation, since it enabled the banks which were carrying large quantities of maturing farmers' obligations to obtain settlement and also to collect, in some instances, back payments upon obligations which had been incurred in times past by farm borrowers who had been prevented from settling on account of unfavorable crop conditions. During the autumn of 1927, a good deal of liquidation of this kind took place and reports from the farming regions were to the effect that there had been unmistakable improvement in the general financial situation.

GENERAL BUSINESS. Owing to the declining tendency of prices, the recession in demand already referred to, the partially saturated condition of the buying public in many lines and a number of other relatively minor factors, general business was distinctly less satisfactory during 1927 than it had been during the preceding year. This state of affairs was reflected in comparatively unsatisfactory earnings. A compilation of earnings, made by one of the Federal Reserve banks, showed that for 177 representative corporations there had been a falling off of earnings in the course of the year amounting to about 10 per cent as compared with 1926. This falling off was obviously not uniform or regular but was found most decidedly in the case of some branches of business which had suffered most seriously in turnover. Among automobile

fully half of the producing establishments of the country were making no net profits.

In other cases, while profits were by no means wiped out, they were quite considerably reduced. This was conspicuously the case with the railroads which reported very decided recessions of earnings, these becoming evident during the second half year. They were, in large measure, a reflection of reduced movements of freight, partly the outgrowth of slackening in the building industry, partly due to lessened movements of coal, resulting from mild weather and from changes in practice with regard to the use of fuel. They were also, however, influenced by very substantial increase in expenses due to the fact that organized labor had for some years past been insisting upon more and more liberal treatment, the increases in wages being progressively transferred from one department to another of the transportation system, so that as a result roads throughout the country found their costs enormously increased. For the year as a whole therefore, the effect was to reduce net revenues of Class I railroads from \$1,233,048,000 to \$1,085,485,000, a decrease of about 12 per cent. This falling off in earning power was interesting, not merely because of its relationship to railroad credit and railroad prosperity, but also because of its bearing upon, and reflection of, general business conditions. (See *RAILWAYS*.)

BUSINESS FAILURES. The narrowing margin of profit in business and the fact that total turnover had decidedly fallen naturally led to increase in liability to failure on the part of concerns that were comparatively weak. The effect of this situation was seen in a generally high failure record, but more especially in the fact that uncommonly heavy mortality was noted among the smaller enterprises, many of which were relatively close to the margin of profitability. As noted in the article on banks and banking, there was decided decline in bank failures, but this improvement constituted one of the few exceptions to the general rule of increased failure liability already referred to. The general showing of business failures for the year may be set forth as follows:

TOTAL NUMBER OF COMMERCIAL FAILURES IN THE UNITED STATES AND DOMINION OF CANADA, WITH ASSETS AND LIABILITIES, 1926-1927, AS REPORTED TO BRADSTREET'S*

	Number of failures		Assets		Liabilities	
	1927	1926	1927	1926	1927	1926
New England states	2,269	2,279	\$17,406,839	\$17,746,521	\$44,506,681	\$40,882,508
Middle states	4,434	4,452	69,142,147	47,165,494	139,755,915	109,980,854
Western states	4,488	4,166	75,168,054	61,728,112	124,045,295	103,646,990
Northwestern states	1,911	2,111	47,491,272	89,865,489	79,926,044	143,368,812
Southern states	5,178	4,937	151,295,848	146,212,071	218,202,858	224,820,630
Far-western states	1,990	2,079	24,599,743	16,992,131	47,845,574	32,585,931
Totals, United States	20,265	20,024	885,098,398	379,709,818	654,282,367	655,228,320
N. Y. C. Man. and Bronx only	1,096	1,141	9,948,705	9,763,806	27,170,685	32,433,462
Canada and Newfoundland	2,016	2,106	10,740,978	11,868,750	26,078,801	28,422,748

companies, for example, figures for the first half of the year showed that about three quarters of all had fallen materially behind 1926, although a few outstanding concerns included in the remaining 25 per cent had made large profits which went far toward offsetting the loss, if the industry as a whole be taken as the basis of comparison. A decidedly narrower margin of profit, however, existed in nearly all branches of business and was so distinctly marked that, at the annual meeting of the National Association of Manufacturers, it was officially declared that

BUSSES, MOTOR. See *AUTOMOBILES*.

BUTLER, JOSEPH GREEN, JR. American steel manufacturer and philanthropist, died December 19 at Youngstown, Ohio. He was born at Temperance Furnace, Pa., in 1840, and was a schoolmate of the late President William McKinley at Niles, Ohio. In later years he testified to his friendship for McKinley by originating the McKinley Birthplace Memorial Association, which built a \$300,000 memorial to McKinley at Niles, and by acting as its president. Mr. Butler gave \$500,000 for the Butler Art Institute at

Youngstown, and endowed the institute. He began his business career as a clerk in a store at Niles. He entered the steel industry in 1866, building a furnace for the Girard Iron Company at Girard, Ohio. Among the numerous companies with which he was connected were the Briar Hill Coal and Iron Company, the Portage Silica Company, the Ohio Steel Company and the Youngstown Sheet and Tube Company. He was a member of the United States industrial commission which visited France in 1916. Mr. Butler published: *Life of McKinley* (1900); *First Trip Across the Continent* (1904); *First Trip Abroad* (1906); *Presidents I have Seen and Known* (1910); *A Journey Through France in War-Time* (1917); *Fifty Years of Iron and Steel* (1917); *History of Youngstown and the Mahoning Valley*; *Recollections of Men and Events* (an autobiography).

BUTLER, NATHANIEL. American educator and former president of Colby College, died at Chicago, Ill., March 3. He was born at Eastport, Me., May 22, 1853, and after graduating from Colby College with the degree of A.B. in 1873 became a teacher, engaging in educational work in various institutions around Chicago. He was ordained to the Baptist ministry in 1884, and was professor of rhetoric and English literature in the University of Chicago, 1884-86. He was professor of Latin, 1886-89, and professor of English language and literature, 1889-92, in the University of Illinois. He was acting director of the University Extension Division, 1893-94, and in the latter year went to the University of Chicago as associate professor of English literature and director of the University Extension Division. In 1895 he went to Colby College as president, returning to the University of Chicago in 1901, becoming professor of education and director of the cooperative work. In 1905 he was made dean of the College of Education, serving until 1909, and from 1916 to 1923 he was dean of University College. In 1924 he became assistant to the president of the University of Chicago, a position he held at the time of his death. He was a delegate of the University of Chicago to the World's Congress on University Extension at London in 1894, and received the honorary degrees of D.D., 1895, and LL.D., 1903, from Colby College. He wrote extensively on topics connected with university extension, and was the author of: *Bellum Helveticum*, a Latin textbook which reached its fifth edition in 1900.

BUTTER. See DAIRYING.

CAHNITE. See MINERALOGY.

CALIFORNIA. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 3,426,861. The estimated population on July 1, 1927, was 4,433,000. The capital is Sacramento.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1927	1,796,000	5,832,000*	\$65,946,000
	1926	1,849,000	5,142,000*	62,541,000
Barley	1927	994,000	27,835,000	25,432,000
	1926	1,080,000	32,400,000	18,792,000
Cotton	1927	128,000	94,000*	8,870,000
	1926	162,000	181,000*	9,170,000
Wheat, winter	1927	812,000	18,642,000	16,098,000
	1926	658,000	12,015,000	15,620,000
Rice	1927	160,000	8,960,000*	10,804,000
	1926	140,000	7,628,000*	10,120,000

Crop	Year	Acreage	Prod. bu.	Value
Potatoes	1927	52,000	7,956,000	7,558,000
	1926	43,000	6,928,000	9,188,000
Sweet potatoes	1927	12,000	1,080,000	1,242,000
	1926	12,000	1,164,000	1,280,000
Corn	1927	77,000	2,464,000	2,661,000
	1926	77,000	2,428,000	2,572,000
Oranges	1927	22,540,000*	67,620,000
	1926	28,167,000*	86,478,000
Grapes	1927	2,264,000*	56,600,000
	1926	2,114,000*	52,850,000
Peaches	1927	20,500,000	10,675,000
	1926	22,542,000	21,189,000
Dry beans	1927	296,000	4,825,000	18,028,000
	1926	805,000	5,784,000	17,202,000

* tons, * bales, * boxes.

MINERAL PRODUCTION. California, which ranked third among the States in 1925 in total value of yearly mineral production, and first as a producer of petroleum, about maintained its petroleum output in 1926. Of petroleum it produced in 1926 224,117,000 barrels, as against 232,492,000 barrels in 1925. The product had a higher total value in 1926, attaining \$355,000,000 as against \$330,610,000 in 1925. Natural gas was produced in 1925, the latest year of available record, in the quantity of 187,789,000 M cubic feet; in 1924, of 189,692,000 M cubic feet. Its total value, for 1925, was \$32,587,000, and for 1924, \$35,949,000. Of gasoline from natural gas, the quantity produced was in 1925, 303,180,000 gallons and in 1924, 232,579,000 gallons; in value, \$32,743,000 for 1925 and \$22,690,000 for 1924. Production of Portland cement in 1926 was 13,842,433 barrels in 1926; in 1925, 13,089,140 barrels. Cement shipments, in value, were \$25,299,245 in 1926; in 1925, \$26,159,531. Clay products, in 1925, the latest year of available report, attained a value of \$23,324,844; in 1924, of \$20,994,732. Sand and gravel were produced to a quantity of 14,077,849 short tons in 1925; in 1924, of 11,132,930 tons; in value, \$8,752,528 in 1925 and in 1924 \$6,653,536.

Production of metals as a whole showed a decrease for 1926 as against 1925, of about 14 per cent as measured by value. The decrease was 9 per cent in the case of gold, 40 per cent for silver and for copper 30 per cent. Lead output value increased 13 per cent and zinc 76 per cent. Of gold there were produced in 1926 576,798 fine ounces, of a value of \$11,923,841; 252,924 fine ounces came from placer workings and 323,874 from lode mines. Silver production was in 1926 2,022,640 fine ounces, as against 3,054,416 in 1925. It had a value of \$1,262,015 for 1926 and for 1925, of \$2,119,765. Copper production in 1926 was 33,466,299 pounds; in 1925, 46,864,913 pounds. Its value was \$4,685,282 in 1926 and in 1925, \$6,654,818. The State produced 8,093,513 pounds of lead in 1926, as against 6,566,000 pounds in 1925; in value, \$647,481 for 1926 and \$571,259 in 1925. Zinc production rose to 20,433,887 pounds for 1926, from 11,489,237 pounds for 1925. The production had a value of \$1,532,542 for 1926 and for 1925 of \$873,182. Copper mines in Shasta County were closed in 1926, as was the California Rand Silver property in San Bernardino County.

The value of the gold, silver, copper, lead and zinc produced in 1927, according to the estimate of the U. S. Bureau of Mines, was \$16,768,500, a decrease of \$3,282,301, or 16 per cent, from 1926. The yield of gold decreased apparently 2 per cent, to 566,600 fine ounces, valued at \$11,711,800; that of silver decreased 30 per cent in value, to 1,568,300 ounces valued at \$889,200.

that of copper, 26 per cent in value, to 26,749,900 pounds, valued at \$3,477,500; that of lead, 73 per cent in value to 2,541,000 pounds, valued at \$172,000; and that of zinc, 66 per cent in value, to 8,247,800 pounds, valued at \$518,000.

FINANCE. As reported by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State government in the fiscal year ending June 30, 1926, were \$61,529,767; their rate per capita was \$14.48. They included \$22,320,202 apportioned for education. Totals not included above, of \$1,688,535 for public service enterprises, \$4,533,372 for interest payments and \$16,114,205 for permanent improvement outlays brought the aggregate of State payments to \$83,865,879. Of this, \$16,163,872 was for highways, \$6,373,785 being for maintenance and \$9,790,087 for construction. Revenue receipts were \$91,948,242; or per capita, \$21.65. Of their total, property and special taxes yielded 18.5 per cent, attaining a per capita rate of \$4. Earnings of the departments and compensation paid the State for officials' services supplied 7.1 per cent of revenue. The sale of licenses, chiefly on incorporated companies and on motor vehicles, and a tax on gasoline sales, supplied 58.3 per cent. Net State indebtedness on June 30, 1926, was \$100,389,995, or \$23.63 per capita. There was in 1926 no direct State property tax levy, and no valuation of taxable property for the entire State was consequently reported.

TRANSPORTATION. The total mileage of railway lines Dec. 31, 1926, was 8277.17. During 1927 three companies reported 32.73 miles of track built, of which 23.61 was first track and 9.72 miles second track.

EDUCATION. A decision of the State Supreme Court with regard to school finances was characterized by State Director A. R. Clifton as placing in the hands of school authorities rather than of supervisors or others the determination of amounts to be used for school purposes. By legislation comprehensive studies in secondary education were authorized; funds were provided for relief and education of crippled children and of children of defective speech.

A registry of minors was taken in October, 1927, but the returns were not available at the end of the year. For the school year 1926-27 the total enrollment was 1,204,705, of whom 716,746 were in common schools and 414,958 in high schools. The total expenditure for education amounted to \$140,244,026.22, and included sums expended for kindergartens, elementary schools, high schools, building sites and buildings. The salaries paid to teachers averaged \$1729 in elementary schools and \$2377 in secondary schools.

CHARITIES AND CORRECTIONS. The State Department of Social Welfare was created in 1927 to replace the State Board of Charities and Corrections and the Bureau of Children's Welfare, and to form a single agency for the control of all activities of the welfare type. The department has at its head an appointed director, serving at the pleasure of the Governor, and holding membership in the Governor's Council. The Department had the function of inspection, with related powers, over 60 county jails, 6 State hospitals, 62 county hospitals, 2 homes for the feeble minded, an industrial home for the blind, 29 detention homes, 2 State prisons, 2 schools for boys, a school for girls; also, 56 orphanages,

29 day nurseries, 11 preventoria, 10 private schools for defectives, 10 rescue homes, 4000 children's boarding homes, 27 homes for the aged, 2 child placing agencies and 9 homes for convalescents. It conducted children's aid in the cases of orphans, half orphans, foundlings, abandoned children and children of the incapacitated, to the number of some 6000, affecting about 14,500 children. The population of the chief types of institutions in 1926 was: State prisons, about 5000; State hospitals, 12,477; homes for the feeble minded, 2,038; homes for the aged, 1,700. According to the U. S. Department of Commerce, 1,789 were admitted to the State prisons and reformatories in 1926. A rebellion of convicts at the Folsom prison was subdued November 25 after the loss of 11 lives and the intervention of the National Guard troops.

LEGISLATION. Convening in January, the forty-seventh State Legislature adjourned April 29. It passed a budget bill carrying \$193,770,466 to cover expenditures during the ensuing two-year period. A series of laws enacted provided extensive reorganization of the administrative bodies of the State government. A Governor's Council was created, consisting of nine members, their number including the Directors of Finance, Public Works, Public Health, Natural Resources, Industrial Relations, State Institutions, Education and Public Welfare. The intent of the law was to meet difficulties encountered in the application of the system of government by commissions instituted some fifteen years before, by centralizing control of the commissions. The law provided that the Council hold monthly meetings and that the members report department activities. Two new departments, those of Natural Resources and of Finance, were erected by statute. In order to meet a deficiency in revenue, caused by court decisions adverse to the constitutionality of previously enacted tax laws to yield estimated receipts of \$12,000,000 in the biennium, emergency tax legislation was enacted. The 7 per cent solvent credits act of 1925 was repealed and securities previously benefiting by that act were again subjected to 100 per cent assessment. The general corporation franchise tax was raised to 1.8 per cent.

A system of laws for the better repression of crime, recommended by the State Crime Commission, was in large part passed. In particular the Habitual Criminal act provided that those convicted of third felonies should be declared habitual criminals and should receive life sentences of imprisonment, subject, however, to release on parole at the end of not less than twelve years of prison service; sentence of death being retained as provided in earlier statutes. Other measures dealt with criminals carrying firearms, regulated the parole system, and rendered more difficult the recourse to insanity pleas on the part of criminal defendants.

In order to provide some \$120,000,000 for highway construction in the following twelve years, a law was passed to raise the gasoline tax to three cents a gallon. It was provided that main State highways, designated as primary roads, should receive 75 per cent of the highway appropriation, and that of such highways 2,345 miles should be built in the northern part of the State and 1,941 in the southern portion. A reapportionment law was enacted, providing representation in the lower house of the State Legis-

lature on a strict population basis, and allowing one State Senator to each county. The State community property law was modified by a measure to recognize the wife's right in such property as a "present and equal" right.

The Legislature ordered a registration of all minors in the State between the ages of three and eighteen years. A bill was passed requiring each of the counties to prepare budgets through county auditors, to be submitted to county supervisors. A Tax Commission was created, with the function of studying the tax needs and resources of the State and reporting to the 1929 Legislature. A Metropolitan Water District act, desired by Los Angeles as an agency for participation in water development of the Colorado River, and permitting four or more municipalities to join for water development purposes, became a law.

POLITICAL AND OTHER EVENTS. The State Supreme Court rendered in January a decision in favor of the rights of riparian owners along streams, as against the hydro-electric interests. It held that the riparian owners had the right to have the stream flow past their land in its usual course, the water being conceived as essential to the property; process of eminent domain was indicated as required in cases where other use of the water was esteemed essential. Recent great increase of the use of water for irrigation and for city consumption, as well as for power development had brought the State within appreciable closeness to the stage where it must require all its normal surface water flow, and on this account the decision bore vitally on the contention of agricultural and other interests for portions of the supply. The United States Supreme Court sustained, May 15, the State's criminal syndicalism law under which Miss Charlotte Anita Whitney, an Oakland social worker, faced a prison sentence for participation in a radical meeting in 1919. Miss Whitney was pardoned by the Governor June 20.

Governor C. C. Young and his administration took office January 4. He laid down among his policies at his inaugural address State administrative consolidation, criminal code revision, a coordinated plan of water conservation, and extension of the prison road camp system. Governor Young appointed a committee in October to confer with producers on means to avoid waste of the natural-gas resources of the State. The State maintained negotiations with Arizona and the other Colorado River States, looking to the securing for California of the terms of the Swing-Johnson bill or like water advantages from that river, for the greater part of the year, but failed to reach any agreement. According to report of October 19, government engineers of the Reclamation Service had obtained estimates of the cost of a barrier to exclude salt waters from the lower San Joaquin and Sacramento Rivers, running from \$38,900,000 to \$97,000,000. The project was intended to increase the fresh water supply for agriculture in the region. Among business developments in the State was the remarkable growth of the Bank of Italy, which on October 12 announced the decision to increase its capital stock and that of an auxiliary by \$90,000,000 to a total of \$200,000,000. Earth tremors in parts of southern California occurred November 4, and were slight except near Santa Maria. The Spanish mission at Santa Barbara was restored during

the year and was consecrated by the Roman Catholic Church, December 3-5.

In San Francisco Mayor Rolph was reelected, November 8, to a fifth term of four years, defeating James E. Power, who had Republican support. An ordinance carrying \$9,380,000 for the completion of highways within the city was ratified by popular vote. Efforts were made on behalf of San Francisco to secure from the U. S. War Department consent to the construction of a bridge across San Francisco Bay north of Hunter's Point. The State Supreme Court on November 12 sustained the power of the city board of education to make its own budget without interference from the Board of Supervisors, within constitutional limits, the latter board being accordingly compelled to place an additional tax levy of 14 cents on each assessed \$100.

The City of Los Angeles had difficulties with dwellers in the Owens Valley, who claimed indemnification to business interests there on account of the withdrawal of water formerly used in the valley for irrigation purposes. The Los Angeles aqueduct was dynamited on several occasions in May, although guarded by an armed force. In October an arrangement was reached by which the city water commissioners were to cooperate with the population of the valley by furnishing work there.

OFFICERS. Governor, C. C. Young; Lieutenant-Governor, Burton R. Pitts; Secretary of State, Frank C. Jordan; Treasurer, Charles G. Johnson; Comptroller, Ray L. Riley; Attorney-General, U. S. Webb; Adjutant-General, Richard R. Mittelstaedt; Surveyor-General, W. S. Kingsbury; Superintendent of Public Instruction, William J. Cooper; Librarian, Milton J. Ferguson; Legislative Counsel, Fred B. Wood; President of the Railroad Commission, E. W. Decoto; Chairman of the Industrial Accident Commission, Will J. French; Commissioner of Insurance, Charles R. Detrick; Chairman of the Highway Commission, Ralph W. Bull; Director of the Department of Agriculture, G. H. Hecke; Labor Commissioner, Walter G. Mathewson.

JUDICIARY. Supreme Court: Chief Justice, Louis W. Myers; Associate Justices, William H. Langdon, John W. Preston, William H. Waste, Emmet Seawell, John E. Richards, John W. Shenk. See CITY PLANNING.

CALIFORNIA, UNIVERSITY OF. A coeducational institution of higher education at Berkeley, Cal., with branches at Los Angeles, San Francisco, Davis, Riverside, La Jolla, and Mount Hamilton, founded in 1868. The number of full-time resident students in courses leading to degrees, on Nov. 1, 1927, was 17,003, of whom 8,780 were women and 8,223 were men. The extension division had, in 1926-27, an enrollment of 35,685. The enrollment for the summer school of 1927 was 10,623 students. At the beginning of the autumn term there were approximately 1500 members on the teaching staff. The endowment funds for 1926-27 amounted to \$11,799,060.67, and the income for the year to \$476,599.20 divided as follows: For current use, \$410,643.46; addition to funds, \$46,557.38; payment on trust funds, \$26,398.36. The library contained 950,000 volumes. During the year final plans were made for moving the university campus at Los Angeles from its old site to a new one purchased by surrounding communities, and construction was started on a central group of four buildings for which the people of the

State voted \$3,000,000 in bonds. At the Davis campus an agricultural engineering building was completed at a cost of \$140,000, and an animal science building was started, to cost approximately \$300,000. In San Francisco a building was purchased and altered for use as an extension centre at a cost of \$197,000. On the main campus at Berkeley, plans were completed for a \$1,750,000 International House, similar to the one already built in New York, to be financed by John D. Rockefeller, Jr.; a site was chosen for another recent gift, Bowles Dormitory, to be built at a cost of \$350,000; final arrangements were made for the construction of a life science building at a cost of \$1,750,000 to house 13 departments; a new Hearst Memorial Gymnasium, costing more than \$1,000,000 was dedicated; and an architect was selected to design a new 90 bed student infirmary to be paid for out of a \$3,000,000 bond issue voted by the people. President, William Wallace Campbell, Sc.D., LL.D.

CAMBODIA. A French protectorate of Indo-China lying to the north of Cochinchina, west of Annam, and south of Laos and Siam. Area, 66,743 square miles; population at the census of 1926, 2,535,178, of whom 1901 were Europeans (excluding the military forces). Pnom-Penh, with a population of 81,712, is the capital, and chief town. The soil is very fertile but only a comparatively small area is under cultivation. The chief product is rice, its annual export amounting to about 250,000 tons. The other products include cotton, pepper, kapok, salt fish, hides, cattle, coffee, sugar, and iron. The imports in 1924 were valued at 32,036,186 francs and the exports at 13,753,000 francs. The budget for 1926 balanced at 10,754,074 piastres. Nominal king, Sisowath (q.v.), who succeeded in 1904, and who died Aug. 17, 1927. Cambodia is one of the five component states of French Indo-China (q.v.).

CAMBRIDGE, LIEUTENANT-COLONEL THE MARQUIS OF. Aid to King George V. and brother of Queen Mary of England, died at Shrewsbury, England, October 24. He was born at Kensington Palace, London, Aug. 13, 1868, the eldest son of the Duke of Teck and Princess Mary Adelaide, and a cousin of King George V. He was educated at Wellington and at the Royal Military College, Sandhurst, joining the Seventeenth Lancers in 1888, and was a captain of the First Life Guards in 1895, becoming a major in 1906 and lieutenant colonel in 1910. During the South African War, 1899-1900, he was transport officer of the Household Cavalry regiment, and from 1904 to 1909 he was military attaché at Vienna. In 1914 he participated in the War with the British Expeditionary Force, and was military secretary in the War Office in 1915. In the early part of 1916 he was military secretary at general headquarters. For his services during the South African War he was brevetted Major, and received the Queen's Medal with clasps, and in the World War his honors included that of the Commander of the Legion of Honor and the Grand Cordon of Leopold. He received many other honors, being created a G. C. B. in 1911, a G.C.V.O. in 1901, K.C.V.O. in 1897, Earl of Eltham in 1917, and Viscount Northlerton in 1917. After 1914 he was governor and constable of Windsor Castle.

CAMEROON or CAMEROONS. See KAMEROON.

CAMPANARI, kām'pā-nā'ri, GIUSEPPE. Italian dramatic baritone, died at Milan, May 31. He was born at Venice, Nov. 17, 1858, and began his career as a cellist in the orchestra at La Scala, in Milan. From 1884 to 1893 he was one of the cellists of the Boston Symphony Orchestra. He made his début as a singer as Mephistopheles in *Faust*, with the Emma Juch Opera Company in New York, in 1893. Then he joined the Hinrichs Opera Company in Philadelphia, and from 1895 to 1898 was a member of the Metropolitan Opera House company. After that time he devoted himself to the concert stage and to teaching in New York. He returned to Italy in 1926.

CAMP FIRE GIRLS. An organization primarily for the adolescent girl. Its purpose is to "seek beauty, give service, pursue knowledge, be trustworthy, hold on to health, glorify work and be happy." The programme evolved to carry out these aims was planned to take care of the out-of-school time of girls, and practically every wholesome activity which would naturally engage the interest of the young girl is included. These activities are grouped under the seven crafts which form the basis of the system of honor and awards which is used: Home craft, health craft, hand craft, camp craft, nature lore, business craft, and patriotism and citizenship. Distributed among these crafts are about seven hundred honors which the girls may earn as steps toward the winning of the three progressive ranks. The Camp Fire Honor System, which is based on the theory that if a thing is worth doing it is worth doing with one's whole heart, makes use of symbolism and ceremony and ritual. Each girl upon joining Camp Fire selects a name for herself which expresses some ambition or ideal. The three ranks of Wood Gatherer, typifying loyalty to organization and group, Fire Maker, the ideal of wider loyalty to mankind and God, and Torch Bearer, which is the highest rank, the desire to pass on undimmed to others that light which has been given to her, symbolize the taking on of certain responsibilities and carrying out certain desires.

The outstanding activities of the year were: A campaign to aid in the planting of trees, which included the planting of over 200,000 trees by the Camp Fire Girls, the study and protection of all plant life, and the sponsoring of contests for tree photographs, tree poems and tree stories; the securing of sites for new camps for girls and the erection of buildings, at St. Paul, Minnesota, and Los Angeles, California, and the beginning of work on camp sites at Butte, Montana, Detroit and Grand Rapids, Michigan, in addition to the camps already in operation; and the special emphasis placed on training of leaders, as a result of the increasing demand for leaders from year to year, in universities, colleges, and normal schools, in Camp Fire Summer Camps and by Camp Fire executives and members of the field staff or guardians' association. The national officers were: Acting president, Miss Florence Hughes; vice presidents, Mr. Joseph E. Raycroft, Mrs. Henrietta Baker Low; treasurer, Dr. Myron T. Scudder; secretary and national executive, Mr. Lester F. Scott. The headquarters are at 31 East 17th Street, New York City.

CANAANITES. See ARCHAEOLOGY.

CANADA. A dominion of the British Empire in North America, bounded on the north by the

Arctic Ocean, on the south by the United States, and on the east and west by the Atlantic and Pacific Oceans, respectively. Capital, Ottawa.

AREA AND POPULATION. The total area is placed at 3,797,123 square miles, of which 3,654,200 is land area and 142,923 water area. It consists of nine provinces, each with its own parliament and administration, and two territories, viz., the Northwest Territories and Yukon Territory, each under a commissioner, assisted by a council. According to the census of 1921, the total population was 8,788,483, as compared with 7,206,643 in 1911.

The accompanying table from the *Canada Year Book* for 1926 shows the areas of the provinces, etc., with the population at recent censuses:

Province	Land area sq. miles	Water area sq. miles	Total area sq. miles	Population, 1901	Population, 1911	Population, 1921
Prince Edward Island	2,184	2,184	103,259	93,728	88,615
Nova Scotia	21,088	860	21,428	459,574	492,838	528,837
New Brunswick	27,911	74	27,985	331,120	351,889	387,876
Quebec	690,865	15,969	706,834	1,648,898	2,005,776	2,301,199
Ontario	365,880	41,882	407,262	2,182,947	2,527,292	2,988,662
Manitoba	231,926	19,906	251,832	255,211	461,894	610,118
British Columbia	245,881	8,819	251,700	178,657	392,480	524,582
Alberta	252,925	2,860	255,285	78,022	374,285	588,454
Saskatchewan	358,416	2,439	355,855	91,279	492,432	757,510
Yukon	206,427	649	207,076	27,219	8,512	4,157
Northwest Territories	548,522	7,500	554,032
	218,460	9,700	228,160	20,129	6,507	7,988
	498,225	34,265	527,490	485
Royal Canadian Navy
Total	3,654,200	142,923	3,797,123	5,871,315	7,206,643	8,788,488

The principal cities with their populations in 1921 were: Montreal, 618,506; Toronto, 521,893; Winnipeg, 179,087; Vancouver, 117,217; Hamilton, 114,151; Ottawa, 107,843; Quebec, 95,193; Calgary, 63,305; London, 60,959; Edmonton, 58,821; Halifax, 53,372; St. John, N. B., 47,166; Victoria, 38,727; Windsor, 38,591.

The accompanying table from the *Canada Year Book* for 1926 shows the vital statistics of population for recent years (the registration area of Canada excludes Quebec and the Territories):

	Years	Births	Birth rate per 1,000	Marriages	Rate per 1,000	Deaths	Rate per 1,000	Excess of births over deaths	Rate natural increase per 1,000 population
Canada (registration area)	1921	168,979	26.4	51,078	8.0	87,722	10.6	101,257	15.8
	1922	164,194	25.1	47,811	7.3	89,028	10.5	95,166	14.5
	1923	156,397	23.7	49,102	7.4	70,182	10.6	86,834	13.1
	1924	157,595	23.4	47,538	7.1	68,197	9.8	91,398	13.6
	1925	154,509	22.6	47,151	6.9	66,419	9.7	88,090	12.9
Quebec *	1921	88,749	37.6	18,659	7.9	33,433	14.1	55,316	23.4
	1922	85,377	35.1	16,809	6.5	33,459	13.3	54,918	21.8
	1923	83,579	32.2	17,361	6.3	35,148	13.6	48,431	18.6
	1924	86,930	35.1	17,591	7.1	32,356	18.0	54,574	22.0
Canada (exclusive of the Territories) ..	1921	257,728	29.3	69,782	8.0	101,155	11.6	156,573	17.8
	1922	252,571	27.8	64,420	7.1	102,487	11.3	150,084	16.5
	1923	240,476	26.1	66,463	7.2	105,880	11.4	135,265	14.7
	1924	244,525	26.5	65,129	7.1	98,563	10.7	145,972	15.8

* Rates for Quebec have been calculated on provincial estimates of population.

The number of immigrants who arrived in Canada during the calendar year 1926, as reported by the Dominion Minister of Immigration and Colonization, was 135,934. The principal nationalities represented include:

British-English	24,541
United States of America	20,944
Scottish	13,861
German	10,720
Ruthenian	9,468

Irish	9,049
Polish	5,350
Magyar	5,182
Finnish	4,721
Jewish	4,441
Slovak	4,010
Norwegian	2,607
Italian	2,539
Swedish	2,324
Jugo-Slav	2,191
Belgian	1,842
Dutch	1,643
Scandinavian-Danish	1,467
Welsh	1,368
Croatian	1,135
Russian	1,074

The occupational classification was given as: Farming, 76,141; labor, 8341; mechanics, 9481; trading, 5267; mining, 1324; female domestics,

13,043; other classes, 22,387. The British Empire Settlement scheme, from its inception to Jan. 31, 1927, cost the Dominion government \$1,146,887; \$474,000 of this was contributed for passage loans and \$667,000 for passage grants. Other expenses not recoverable account for the remainder.

The population of the Dominion of June 1, 1926, was officially estimated to have been 9,389,300, an apparent increase of approximately 600,000 over the 1921 census. The only parts of the Dominion for which gains were not calculated

were the province of Prince Edward Island and the Yukon Territory. According to municipal statistics for 1925, the population of some of the principal Canadian cities in that year was as follows: Montreal, 907,500; Toronto, 542,189; Winnipeg, 195,148; Vancouver, 128,350; Quebec, 124,341; Hamilton, 122,238; and Ottawa, 118,088.

The religious denominations in the order of their numerical importance in 1921 were: Ro-

man Catholics, Presbyterians, Anglicans, Methodists, Baptists, Lutherans, the Greek Church, Jews, Mennonites, and Congregationalists. Of these 3,389,636 were Roman Catholics, 1,409,407 Presbyterians, 1,407,994 Anglicans, and 1,159,458 Methodists. (See CANADA, UNITED CHURCH OF.)

EDUCATION. The control of education in the Dominion is directly in the hands of the provinces. For the latest available statistics on education in each province, consult the article on that province. The latest available statistics for Canada as a whole are shown in the accompanying table, an extract from the Survey of Education in Canada by the Dominion Bureau of Statistics for 1925.

Provinces	Year ended	Schools ^a	Teachers	Pupils	Expenditure Dollars
Ontario	Dec. 31, 1924 Elem. } June 30, 1925 Sec. }	7,450	17,558	671,311	45,030,685
Quebec	June 30, 1924	7,797	18,699	488,322	27,917,738
Nova Scotia	July 31, 1924	1,769	3,331	112,352	3,704,939
New Brunswick	June 30, 1925	1,472	2,484	80,145	3,348,373
Manitoba	June 30, 1925	1,991	4,028	145,834	8,547,445
British Columbia	June 30, 1925	759	3,294	97,954	7,869,088
P. E. Island	June 30, 1925	472	616	17,427	452,699
Alberta	June 30, 1925	3,361	4,864	145,892	9,730,091
Saskatchewan	June 30, 1925	6,254	7,520	97,954	14,432,176
Total		31,325	62,894	1,965,832	121,084,234

^a Where possible the number of school-houses is given, in operation.

Higher education in Canada is carried on in 23 universities and 82 colleges, including 21 classical colleges in Quebec. Of the universities six are state-controlled (New Brunswick, Toronto, Manitoba, Saskatchewan, Alberta, and British Columbia); four others are undenominational (Dalhousie, McGill, Queen's and Western); while the remainder are denominational. The 23 universities had 3864 professors and 49,843 students in 1924-25. Some of the denominational universities include: King's, Acadia, and St. Francis Xavier in Nova Scotia; Mt. Allison in New Brunswick; Laval and Bishop's College in Quebec; and McMaster and Ottawa in Ontario.

AGRICULTURE, ETC. The estimated value of Canada's principal field crops harvested during the calendar year 1927 was \$1,141,367,000. The increase of \$35,839,000 over 1926 indicated an augmented purchasing power of nearly \$60 each for approximately 600,000 families on Canadian farms. The estimated value of the wheat crop was \$452,602,000 (increase, \$10,381,000); oats, \$231,295,000 (increase, \$47,197,000); barley, \$63,668,000 (increase, \$11,609,000); rye, \$12,668,500 (increase \$3,238,000); other grains, 47,752,000 (increase, \$1,319,500); flaxseed, \$7,379,000 (decrease, \$2,309,000); potatoes, \$56,279,000 (decrease, \$12,925,000); hay, clover, and alfalfa, \$201,215,000 (increase, \$2,563,000); root and fodder crops, \$68,508,000 (decrease, \$25,235,000). The average price of wheat per bushel was seven cents less in 1927 than in 1926 owing to the larger crop and the poor quality of much of the grain, but the prices of oats, barley and rye were all higher. Stocks of wheat in the terminal elevators at the head of the lakes on Dec. 9, 1927, were 13,232,000 bushels as compared with 21,994,000 bushels on the same date in 1926. For the latest statistics on the area planted under the various crops, see preceding **Year Book**.

The *dairying* industry of Canada is carried on most extensively in Ontario and Quebec, although there are dairy factories in all of the provinces. In 1925 there were 1240 creameries, 1390 cheese factories, 358 combined butter and cheese factories, and 24 condensed milk factories in the Dominion. The total value of all their products was \$141,406,623 as compared with \$122,027,181 in the preceding year. The production of creamery butter was 180,069,215 pounds valued at \$67,007,704; of factory cheese 178,350,346 pounds, valued at \$36,781,343; the value of condensed products was \$9,844,613; and of sundry products, \$27,772,963. The estimated total consumption of butter, cheese and eggs for 1926 was 267,961,643 pounds, 36,804,476 pounds,

and elsewhere the number of school districts with schools

and 264,783,655 dozen respectively. Per capita consumption was 28.54 pounds, 3.92 pounds and 28.20 dozen respectively.

FRUIT farming is of considerable importance, the chief products being apples, although peaches, pears, plums, cherries, and small fruit are grown in abundance. According to the *Canada Year Book* for 1926 the production of the more important fruits in 1925 with the value was as follows: Apples, 2,943,060 barrels, \$16,709,440; pears, 156,422 bushels, \$332,735; plums and prunes, 79,562 bushels, \$154,288; peaches, 201,840 bushels, \$547,772; cherries, 114,925 bushels, \$409,210; strawberries, 8,070,000 quarts, \$1,458,950; grapes, 24,000,000 pounds, \$1,680,000.

In the same year 27,815 acres were under *tobacco* (chiefly in Ontario and Quebec), and the total production was 29,255,000 pounds valued at \$7,002,400.

The *livestock* census for June, 1926, was as follows:

LIVESTOCK IN CANADA, JUNE, 1926

Horses	3,558,849
Milch cows	3,951,885
Other cattle	5,208,815
Sheep	2,877,363
Pigs	4,470,771
Poultry	49,641,472

The wool-clip of Canada for 1926 was estimated at 17,180,270 pounds valued at \$3,780,000.

FISHERIES. In addition to an immense salt-water fishing area Canada has 220,000 square miles of fresh water abundantly stocked with many species of excellent food fishes. In 1925 the total value of the fisheries of Canada was \$47,926,802. The principal kinds of fish marketed were: Salmon, \$15,760,630; cod, \$6,232,821; lobsters, \$5,552,977; halibut, \$4,186,391; herring, \$3,117,841; whitefish, \$1,974,871; haddock, \$1,171,555; trout, \$1,097,728; pickerel, \$1,056,169; smelts, \$1,035,504; and sardines, \$1,017,208. In 1925-26, the exports were valued at \$36,792,663

(dry-salted codfish, \$5,246,462; canned lobsters, \$4,037,259; fresh lobsters, \$1,255,876; canned salmon, \$10,467,680). The number of persons employed in 1925 was 73,855, including those in shore work and canneries. The number of factories and canneries in operation in 1925 was 852. It was reported in August, 1927, that the federal government would appoint a commission to investigate all phases of the fishing industry in the Maritime Provinces. The main object of the commission was to enlarge the market and insure inshore fisherman better prices for the catch.

FORESTS. The most important forest areas are in Northern Ontario, Quebec, and British Columbia. The total area of land covered by forests is officially estimated at 1,227,000 square miles. Of this less than 40 per cent is covered with commercial timber. The exported forest products (wood and wood products, unmanufactured) amounted to \$115,530,322 in 1925-26. In the same year the value of manufactured wood and paper exports was \$163,144,638. The greater part of the exports go to the United States, which took more than 85 per cent of the exportable surplus in 1925-26. The president of the newly-formed Canadian Forest Products Publicity Association reported in December, 1927, that the unsold stocks of lumber in the hands of the manufacturers was lighter than for the past seven years. It was proposed to continue the 1927 volume of production in 1928. The Association was reported to have planned to spend in the next four years \$2,500,000 on industrial research and a campaign to offset the competition of materials sold as substitutes for lumber.

FUR INDUSTRY. The continued growth of the *fur-farming* industry of Canada was shown by the statistics for the year 1926. The number of farms in operation in that year was 2702, compared with 2283 in 1925, while the total value of property (comprising land and buildings and fur-bearing animals) was \$14,888,705, an increase over the preceding year of \$1,647,460 or 12 per cent. Of the 2702 farms, 2517 were fox farms, thus indicating the chief source of revenue. The number of pelts sold in 1926 was 16,643 with a value of \$1,218,111 as compared with 11,293, valued at \$781,383 in 1925. The total amount received by the farmers from the sale of live fur-bearing animals and pelts in 1926 was \$3,494,775, a decrease from the preceding year of \$183,878 or 5 per cent.

MINERAL PRODUCTION. According to the official estimates compiled by the Dominion Bureau of Statistics and published on Dec. 29, 1927, a new high record for mineral production in Canada was set in 1927, when the value of the output reached \$241,773,000, marking a gain of \$1,335,877 over the previous year's record total of \$240,437,123. New output records for all time were established in 1927 in gold, copper, lead, zinc, cement, gypsum and lime and in the value of natural gas and petroleum. Increased production, in comparison with the totals for 1926, was noted in the outputs of arsenic, cobalt, copper, gold, lead, nickel, platinum metals, zinc, coal, natural gas, petroleum, gypsum, pyrites, quartz, clay products, cement, lime, stone, sand and gravel.

Gold production amounted to 1,825,421 fine ounces, valued at \$37,731,080, as compared with the previous record value set in 1926 of \$36,-

263,110. Silver production, at 22,210,936 fine ounces, showed a slight advance over the 22,171,294 fine ounces produced in 1926, but the value dropped to \$12,488,000, as compared with \$13,894,531 in 1926. Nickel production from the Sudbury district increased to 66,435,799 pounds valued at \$15,105,361. Copper, mostly from the treatment of the nickel-copper ores mined near Sudbury and from the copper-gold ores of British Columbia and Quebec, reached an output of 140,223,717 pounds in 1927. British Columbia mines yielded 91,910,274 pounds; Ontario, 45,652,721 pounds, and Quebec, 2,660,722 pounds. Lead output increased to a new record at 308,742,826 pounds, worth \$16,456,877, and zinc rose to 160,108,800 pounds. Fuels showed a general advance. Production values totaled \$70,660,900 for coal, gas and petroleum in 1927, as against \$68,743,933 in 1926. The Dominion government has granted permission by Order-in-Council for the exportation of blister copper to be shipped from the Flin Flon mine in Northern Manitoba until facilities have been established in Canada for the final treatment of the metal. The mining company has been exempted until 1947 from the payment of royalties, which are 30 cents per hundredweight on copper, ten cents per hundredweight on zinc, 37½ cents per ounce on gold and 15 mills per ounce on silver.

In October, 1927, The U. S. Bureau of Foreign and Domestic Commerce reported that in 1926 Canada had the largest production of unmanufactured asbestos ever recorded. Practically all the producing asbestos mines are located in the eastern townships of Quebec, the production of that province for the year being 279,389 tons, valued at \$10,095,487. This represents an increase of 2.2 per cent in tonnage and 13.8 per cent in value over the production of the preceding year. The larger increase in value was accounted for in part by the more effective control of output exercised by the merged companies known as the Asbestos Corporation, the largest producer in the district. (See table, page 151.)

MANUFACTURING. The census of Canadian manufactures for 1925, made known in December, 1927, showed that 22,331 individual establishments (increase, ¼ of 1 per cent) reported a total capital investment of \$3,808,309,981 (increase, 7.61 per cent); 544,225 persons employed (increase 7 per cent); salaries, \$143,056,516 (increase, 2.47 per cent); wages, \$452,958,655 (increase, 7.78 per cent); cost of materials, \$1,587,665,408 (increase, 10.37 per cent), and value of products, \$1,360,879,907 (increase, 8.29 per cent). Average salaries increased by ⅔ of 1 per cent and average wages decreased by ⅓ of 1 per cent. Canada's ten leading manufacturing industries in 1925 in the order of their production value were pulp and paper, flour and grist-mill products, slaughtering and meat packing, saw-mills, butter and cheese, automobiles, electric light and power, rubber goods, cotton yarn and cloth, and sugar refineries.

Power equipment of the manufacturing industries in 1925, aggregated 5,083,107 horse power, including 4,012,756 horse power generated by hydraulic turbines or water wheels, 992,916 horse power by steam engines and turbines, and 77,435 by internal combustion engines. The net increase of the total was 18 per cent over 1924. The value of manufactured products available for consumption in 1925 was \$2,927,553,393, of which domestic production, minus exports,

MINERAL PRODUCTION OF CANADA, 1926 AND 1927
[Official estimates for 1927, with comparative figures for 1926]

	1926		1927	
	Quantity	Value	Quantity	Value

comprised 77 per cent, and imports represented 23 per cent.

COMMERCE. On Nov. 28, 1927, *Commerce Reports* of the U. S. Bureau of Foreign and Domestic Commerce published some statistics in connection with a census of trading establishments in Canada. Reports from 66,814 wholesale and retail firms in Canada were received by the Dominion Bureau of Statistics in connection with this census. A large number of very small trading units, not included in the returns, are of value only as an indication of the extent of the activities of the more important concerns of the Dominion. The census, which pertains to the year 1923, covers 60,181 retail stores, 3782 wholesale firms, and 2861 companies having both wholesale and retail departments. The total number under single ownership is 49,833; operated by joint-stock companies, 9493; operated by partnerships, 7488.

The aggregate capital invested was shown by inventory as \$1,580,123,723, including: Retailers, \$914,990,830; wholesalers, \$476,559,544; and combined wholesalers and retailers, \$188,573,349. Working capital, including cash on hand and in banks, merchandise on hand and accounts due, comprised \$612,333,521 for the retail stores; \$380,777,833 for the wholesale establishments; and \$129,383,160 for the firms doing both wholesale and retail business. The average capital investment in retail stores was \$15,204; in wholesale, \$126,007; and in wholesale and retail, \$66,143.

In the total and average purchases and sales of merchandise, as shown in the following table, it is explained that the high average for retail

purchases and sales is partly due to the inclusion in the totals of 11,115 firms conducting general and departmental stores, of which 71 firms reported sales amounting to \$1,000,000 or over.

Item	Retail	Wholesale	Wholesale and retail
Total purchases	\$1,225,016,862	\$812,139,031	\$283,922,904
Average purchases	20,855	214,737	99,587
Total sales	1,642,103,468	1,021,920,981	866,688,786
Average sales	27,286	270,206	128,600

The total employees of the reporting firms numbered 168,392 males and 73,468 females, who received \$261,040,558 in salaries and wages. The average wage in retail stores was \$965; in wholesale, \$1521; and in wholesale and retail, \$1216. The average number of employees was 2.5 in retail establishments, 15.2 in wholesale, and 9.8 in wholesale-retail.

The census covers 24,176 establishments in Ontario, 17,753 in Quebec, 5423 in Saskatchewan, 4648 in British Columbia, 4247 in Alberta, 4215 in Manitoba, 3424 in Nova Scotia, 2528 in New Brunswick, and 400 in Prince Edward Island. Retail business was most profitable in British Columbia, Manitoba, New Brunswick, and Ontario, on the basis of trade per dollar of capital invested; wholesale business yielded the largest returns in Prince Edward Island, British Columbia, New Brunswick, Nova Scotia, and Ontario; and combined wholesale and retail business was most remunerative in Ontario and Quebec. The total returns show that, in the Dominion, as a whole, retailers averaged \$1.80

worth of trade for each dollar invested; wholesalers, \$2.13; and wholesalers-retailers, \$1.94.

The 27 cities with a population of 20,000 and over had 37 per cent of the retail stores and did 53 per cent of the retail business; had 74 per cent of the wholesale establishments and made 86 per cent of the sales; had 48 per cent of the wholesale and retail stores and made 65½ per cent of the sales.

In considering the foregoing figures it should be remembered that merchandising channels in Canada have changed considerably since 1923, owing to the rapid growth of large departmental stores and mail-order houses, the increase in the number of chain stores, and the tendency to form buying groups of wholesalers and retailers. These trends have reduced the number of independent stores. Estimates of the aggregate number of retailers in Canada in 1927 varied from 120,000 to 150,000, and it was evident that the returns from the 60,181 retail stores included in the census were quite inadequate to afford a complete picture of the operations of Canadian retailers. The figures relating to the business of wholesale concerns and combined wholesale and retail companies are believed to be much more representative.

According to the condensed preliminary report of the trade of Canada for 1927, the foreign trade of Canada during the year 1926-27 was on the whole satisfactory. The year was marked by a steady improvement in practically every phase of the industrial and commercial activities of the country. The more rapid flow of capital into the basic industries during the past year was especially noteworthy. These factors indicate that the Dominion had successfully passed through the post-war liquidation period, with favorable prospects for still greater expansion. Canada's export trade from 1921 to 1925 expanded more rapidly than her import trade and as a result there was a steadily increasing favorable balance of trade. During 1926-27, however, exports show a decrease of \$61,000,000, while imports, due to the Dominion's increased buying power, increased \$103,600,000 thus reducing by the totals of these amounts the favorable trade balance, which amounted to \$401,400,000 in 1926, to \$236,700,000 in 1927.

FOREIGN TRADE. The foreign trade of Canada for the fiscal year ended Mar. 31, 1927, amounted to \$2,298,465,647, compared with a similar trade in 1926 of \$2,256,028,869 and in 1925 of \$1,873,294,180, the increase over 1926 amounting to \$42,436,778 or 1.9 per cent, and over 1925 to \$420,171,467 or 22.3 per cent. Imports showed an improvement over the years 1926 and 1925, while exports showed a decline compared with 1926, but an increase over 1925. In 1927 Canada's import trade was valued at \$1,030,892,505, as compared with \$927,328,732 in 1926, and \$796,932,537 in 1924, the increase over 1926 amounting to \$103,563,773 or 11.1 per cent, and over 1925 to \$233,959,968 or 29.3 per cent, while export trade in 1927 (domestic and foreign combined) was valued at \$1,267,573,142, compared with \$1,328,700,137 in 1926, and \$1,081,361,643 in 1925; the decrease compared with 1926 amounting to \$61,126,995 or 4.6 per cent, whereas the increase compared with 1925 amounted to \$186,211,499 or 17.2 per cent. During the past three fiscal years the exports from Canada, distinguishing domestic from foreign, were:

<i>Fiscal years</i>	<i>Canadian exports</i>	<i>Foreign exports</i>	<i>Total exports</i>
1925.....	\$1,069,067,353	\$12,294,290	\$1,081,361,643
1926. ...	1,315,355,791	13,844,846	1,328,700,137
1927.....	1,252,157,506	15,415,636	1,267,573,142

The domestic exports of Canada for 1927 show a decrease compared with similar exports in 1926 of \$63,198,285 or 4.8 per cent, but an increase over 1925 of \$183,090,153, or 17.1 per cent. The United States had a population of 75,000,000 before the total foreign trade of that country was as large as that of Canada to-day.

Increase in Imports, 1926-1927.—The increase in imports of \$103,563,773 in 1927 over 1926 was due to gains in each of the main groups, except "fibres and textiles," which shows a slight decrease. The increase in the agricultural and vegetable products group was \$9,680,690 (under this group alcoholic beverages increased \$4,058,242; sugar and its products \$3,892,363; corn \$3,108,914; fruits \$2,983,574; vegetable oils \$2,112,807; seeds \$1,407,216; green coffee \$573,167 and vegetables \$556,533; while crude rubber decreased \$9,793,835); the animal products group increased \$4,028,577 (the chief increases under this group were: furs \$2,704,616; unmanufactured leather \$1,063,526; manufactured leather \$654,845; fish \$472,910; and eggs \$340,357; while meats decreased \$556,239 and lard \$308,870); the fibres and textiles group decreased \$1,777,900; while the wood and paper group increased \$7,559,202 (the principal items under this group to show increases were: unmanufactured wood, \$2,630,417; paper \$1,995,844; books and printed matter \$1,592,217; and manufactured wood, \$1,380,724); the iron and its products group increased \$48,232,685 (the chief increases occurred in automobiles \$11,287,853; machinery \$9,050,005; automobile parts \$7,225,352; rolling mill products \$6,111,570; farm implements \$5,609,638; and engines and boilers \$2,060,595); the non-ferrous metals group increased \$5,054,857 (the chief increases were: aluminum \$1,538,093; electric apparatus \$916,190; clocks and watches \$796,533; tin in blocks \$680,541; and brass \$620,076); while the non-metallic group increased \$17,750,767 (the principal increases under this group were: crude petroleum \$6,357,000; coal \$6,008,842; refined petroleum \$1,739,322; glass and glassware \$1,340,550 and sulphur \$977,733). The chemicals and allied products group increased \$3,440,439, the miscellaneous group increased \$8,994,456.

Decrease in Exports, 1926-1927.—The total decrease in the exports of Canadian produce, 1927 compared with 1926, amounted to \$63,198,285. Six of the main groups show decreases and three increases. The following groups show decreases: Agricultural and vegetable products, animal products, fibres and textiles, iron and its products, non-ferrous metals, and chemical products, while the following show increases: Wood and paper, non-metallic minerals and miscellaneous commodities. The agricultural and vegetable products group decreased \$31,064,510 (the chief decreases under this group were: Oats \$15,638,938; wheat \$11,269,448; flaxseed \$7,511,185; and refined sugar \$4,864,688; while alcoholic beverages increased \$3,630,276 and barley \$2,692,913); the animal products group decreased \$23,683,828; (under this group cheese shows a decrease of \$8,762,408; meats \$7,703,

228; cattle \$6,502,422; and butter \$5,421,536; while raw furs show an increase of \$3,087,339; the fibres and textiles group decreased \$1,274,483, while the wood and paper group increased \$5,445,307 (under this group printing paper shows an increase of \$14,292,314; and unmanufactured wood a decrease of \$7,674,892). The iron and its products group shows a decrease of \$450,253; the non-ferrous metals group a decrease of \$16,837,073 (under this group raw gold shows a decrease of \$19,113,752, while zinc shows an increase of \$2,611,555); the non-metallic group increased \$3,940,993 (the chief items to show increases were: Coal \$3,103,287; crude petroleum \$820,558, and raw asbestos \$693,794; while cement shows a decrease of \$1,127,418); the chemical products group decreased \$923,375 (the exports of fertilizers under this group decreased \$786,029); while the miscellaneous group increased \$1,048,937 (under this group films increased \$1,055,418, and musical instruments \$760,288).

The most notable decrease in Canadian exports occurred in the item "Gold-bearing quartz, nuggets, etc." which, from 1926 to 1927, decreased from \$25,968,094 to \$6,854,342 or \$19,113,752. The decrease in the exports was not due to a falling off in the production of gold in Canada, (the production during the calendar year 1925 was valued at \$35,880,000 and in 1926 at \$35,749,000) but to the fact that in the calendar year 1926 the Royal Mint, Ottawa, purchased about 78 per cent of the Canadian output, while in 1925 it purchased only about 7 per cent.

Trade with the United States.—The trade of Canada with the United States for the fiscal year ended Mar. 31, 1927, amounted to \$1,167,039,699, as compared with trade in 1926 of \$1,095,671,872, the increase amounting to \$71,367,827 or 6.5 per cent. In 1927 the imports from the United States amounted to \$687,707,719, as compared with an import trade in 1926 of \$609,719,637, representing an increase of \$77,988,082 or 12.8 per cent, while exports to the United States in 1927 totalled \$479,331,980, as compared with \$485,952,235 in 1926, the decrease during the year amounting to \$6,620,255, or 1.3 per cent. In 1927 the domestic exports were \$466,419,539 and in 1926 \$474,987,367, while the foreign exports in 1927 amounted to \$12,912,441 and in 1926 to \$10,964,868. The domestic exports show a decrease of \$8,567,828 and foreign exports an increase of \$1,947,573. The increase in the imports from 1926 to 1927, amounting to \$77,988,082, was

principally due to increased imports of iron and steel (\$48,600,000), non-metallic minerals (\$21,300,000), miscellaneous commodities (\$6,900,000), wood and paper (\$6,400,000). Fibres and textiles decreased \$12,100,000. The agricultural and vegetable products group decreased from \$98,495,849, to \$97,104,543, or \$1,391,306.

Imports from the United States for the calendar year 1927 were valued at \$835,878,000 as compared with \$738,475,000 in 1926; a gain of more than 13 per cent.

The decrease in the exports of Canadian produce to the United States from 1926 to 1927 amounted to \$8,567,828. Five of the main groups show increases and four decreases. The exports under the main group of agricultural and vegetable products decreased from \$65,964,214 to \$59,953,683, or \$6,010,531. Under this group flaxseed decreased \$7,511,203, bran and shorts \$1,957,383, and all grains \$1,730,555, while the exports of alcoholic beverages increased \$4,166,612 and potatoes \$1,508,717. The animal products group increased from \$63,464,732 to \$75,320,135, or \$11,855,403. Under this group the following commodities show increases; Meats \$2,909,431, cheese \$2,351,549, raw furs \$2,188,986, animals \$1,813,834, fish \$1,031,308, milk and cream \$896,167, and unmanufactured leather \$732,943. The exports under the fibres and textiles group decreased from \$4,628,071, to \$3,451,081, or \$1,176,990. The falling off in the exports of raw wool, amounting to \$909,970, was mainly responsible for the decrease in the fibres and textiles group. The wood and paper group increased from \$237,906,110 to \$242,019,601, or \$4,113,491. Under this group paper, chiefly newsprint, increased \$11,778,876, while unmanufactured wood, principally planks and boards, decreased \$6,145,697, and manufactured wood, chiefly wood pulp, decreased \$1,656,036. The iron and its products group increased from \$7,582,833 to \$10,680,762, or \$3,097,929. The exports of farm implements accounted for \$1,668,589 of the increase under this group, and pigs, blooms and ingots for \$1,257,116. The non-ferrous metals group decreased from \$58,740,061 to \$39,007,020, or \$19,733,041. The decrease in the exports of raw gold, amounting to \$19,120,373, was largely responsible for the decrease in the non-ferrous metals group. The non-metallic minerals group increased from \$17,244,986 to \$17,251,325, or \$6,339, while the chemical products group decreased from \$9,197,929 to \$8,092,371, or \$1,105,558, and the miscellaneous group increased from \$10,258,431 to \$10,643,561, or \$385,130.

SUMMARY OF THE TRADE OF CANADA BY MAIN GROUPS, 1914, 1921, AND 1927

Main groups	Value of imports (million \$)			Value of exports (Canadian (million \$)			Percentage 1927 Of imports Of exports			
	1914	1921	1927	1914	1921	1927	1914	1921	1914	1921
(A) WITH ALL COUNTRIES										
Agricultural and vegetable products	97.6	259.4	213.1	201.2	482.1	575.0	218.8	82.1	285.3	119.3

During 1927 the number of commercial failures in Canada number 2182, with liabilities amounting to \$34,461,595. This is a decrease of four in number and \$2,621,287, or 7 per cent, in liabilities, from 1926.

The number of telephones in operation in Canada during 1926 was 1,201,008, or 5 per cent more than during the previous year. According to these figures, there are now 12.79 telephones to each 100 persons in the Dominion.

The value of building permits issued by 63 Canadian cities for the year ended Dec. 31, 1927, was \$185,451,271, or 18 per cent above 1926, which held the previous post-war record.

FINANCE. The following table supplied by the finance department of the Canadian government shows the results of the budget for 1926-27:

REVENUES AND EXPENDITURES	
Ordinary revenue	Total Apr. 1, 1926 to Mar. 31, 1927
Taxation revenue:	
Customs duties	\$141,968,677.64
Excise duties	43,518,160.44
War tax revenue:	
Excise taxes (sales, stamps, etc.) ..	105,618,160.00
Income tax	47,886,309.22
Business profits tax	710,102.19
Miscellaneous taxes	2,457,862.55
Total taxes	346,649,272.04
Interest on investments	8,559,401.12
Post office	29,069,169.85
Dominion lands	3,327,273.22
Canada Grain Act	2,532,984.15
Miscellaneous	8,507,676.50
Total ordinary revenue	398,695,776.88
Special receipts and credits on consolidated fund	1,757,704.02
Total	400,453,480.40

Ordinary expenditure	
Interest on public debt	129,675,867.50
Pensions	87,902,988.56
Subsidies to provinces	12,516,740.50
Soldier land settlement	1,250,787.45
Soldiers' civil re-establishment	6,976,761.81
Customs and excise	10,180,429.98
Post office	81,097,698.04

REVENUES AND EXPENDITURES—Continued

Ordinary revenue	Total Apr. 1, 1926 to Mar. 31, 1927
National defense	13,086,050.97
Agriculture	5,838,941.14
Public works, chargeable to income ..	11,178,054.24
Dominion lands and parks	4,251,662.54
Trade and commerce	4,332,837.87
Civil government	10,865,757.21
All other expenditure	40,584,144.78
Total ordinary expenditure ..	319,548,172.59
Special expenditure:	
Adjustment of war claims	64,405.08
Discount and expenses of loan flotations	3,278,032.13
Miscellaneous charges to consolidated fund	4,537,944.74
Capital expenditure:	
Public works	2,920,670.20
Railways and canals	16,638,032.43
Loans and advances non-active:	
Loans to Canadian National Railways	10,000,000.00
Loans to Canadian Government Merchant Marine	426,817.14
Loans to Quebec Harbor Commission	680,000.00
Miscellaneous accounts written down as non-active	462,496.76
Grand total expenditure	358,556,751.07
Decrease of debt	41,896,729.38
Increase of debt	
Net debt Mar. 31, 1926	2,389,781,099.42
Net debt Mar. 31, 1927	2,347,834,870.09

On Dec. 31, 1927 the total funded debt of the Dominion of Canada was \$2,442,228,463, a reduction of about \$38,000,000 as compared with Dec. 31, 1926. Figures from the financial statement of the Dominion as of December 31 showed Dominion notes outstanding as \$193,579,447, against \$210,810,660 on Dec. 31, 1926; total liabilities, \$2,316,586,792, against \$2,772,582,397; sinking funds, \$44,226,652, against \$47,681,306; specie reserve, \$130,586,091, against \$119,193,407; miscellaneous and banking accounts, \$75,601,724, against \$108,934,457; active assets, \$473,222,601, against \$491,102,862; and total

net debt \$2,343,364,190, as compared with \$2,281,479,535.

No tariff changes were proposed in the government budget for the fiscal year 1927-28, as introduced in the House of Commons on February 17, but provision was made for an aggregate reduction of \$27,000,000 in taxation. The provisional decreases subject to the approval of Parliament were: Sales tax 20 per cent; income tax, 10 per cent; excise tax on matches, 25 per cent. The stamp tax on each check or similar document would be lowered to two cents, and the stamp tax on overdrafts and advances by banks abolished. Greater commercial stability and the release of additional funds for general purchasing were regarded as the principal purposes of the budget proposals. In his budget speech the Minister of Finance estimated that the net debt of Canada on Mar. 31, 1927, would be reduced by \$31,000,000 from the amount on the same date of 1926. According to the figures given above it was actually reduced by \$41,896,751. On Nov. 30, 1927, the net debt of the Dominion was given at \$2,287,049,782, which showed a reduction of \$60,784,000 since April 1.

SHIPPING. According to the latest available statistics the vessels entered and cleared at Canadian ports on inland waters between the United States and Canada were: Canadian, 26,653 of 18,654,786 tons; United States, 66,770 of 18,303,239 tons. The inland waterway system of Canada by lakes, rivers, and canals has a length of over 2700 miles. In 1925, 31,948 vessels of 18,789,709 tons passed through the Canadian canals. In the same year, sea-going vessels (as distinguished from inland trade with the United States) to the number of 20,436 of 20,470,379 tons entered the ports of Canada and 20,420 of 20,510,647 tons cleared.

The Canadian Government Merchant Marine (Ltd.), in its annual report for 1926, indicated that the company experienced a very satisfactory year. The operating loss amounted to only \$90,159, which represents an improvement of \$859,893 as compared with the previous year. In all, 46 vessels with an aggregate deadweight tonnage of 312,090 were operated. The business carried on during the year is shown by the following figures: Export traffic, 821,856 tons, valued at \$97,820,572; import traffic, 397,704 tons, valued at \$54,495,914; intercoastal traffic, 71,006 tons, valued at \$9,170,444; total, 1,290,566 tons, valued at \$161,495,931.

RAILWAYS. The mileage of the steam railways operated in 1925 amounted to 40,352 miles; the capital liability was \$3,471,080,909; gross earnings, \$455,297,288; operating expenses, \$372,149,656; net earnings, \$83,148,000; operating ratio, 81.70 per cent; freight ton-miles, 31,965,204,683; passenger miles, 2,910,760,047; employees, 166,027; salaries and wages, \$237,755,752.

The Minister of Railways and Canals in the spring announced in the Canadian House of Commons that the Canadian National Railways would require during 1927, \$1,660,000 to complete former branch lines and \$7,356,000 to carry out the new branch line programme, which will consist of 337 miles of grading, 94 miles of track, and 56 miles of ballast. Additions and improvements will cost \$17,834,000. The government loan of \$5,000,000 and part of the trust issue for \$15,000,000, will provide for equipment. In the month of July it was stated that the Canadian National Railways were engaged in an extensive

programme of new construction and improvements and that work was being done over all the system from the Atlantic to the Pacific. The maintenance department was relaying 297 miles of main-line track with 100-pound rail and 421 miles of other track with 85-pound rail. The track material required included 4,042,000 tie-plates and 858,000 rail anchors. Changes in and additions to the terminal tracks at Charlottetown, Prince Edward Island, were planned, and yard tracks were to be extended at Sarnia and Windsor, Ontario, and at Port Mann, British Columbia. The main line between Montreal and Toronto was to be rebalasted, and this with similar work on other parts of the system will involve the use of 317,000 cubic yards of crushed rock, 24,000 cubic yards of slag, and 1,763,000 cubic yards of gravel. The programme also provides for extensions to the automatic signal system, for the replacement of numerous wooden trestles with steel and concrete, and for the erection of several buildings.

NEW CANADIAN RAILWAY LINES TO BE CONSTRUCTED

<i>Line</i>	<i>Mileage</i>	<i>Estimated Cost</i>
St. Felicien to Mistassini River, Lake St. John district, Quebec	27.3	\$1,468,000
Herbertville to Savanne Falls, Lake St. John district, Quebec	84.5	2,132,000
Grand'Mère to East Burris, Quebec	7.9	1,688,000
Pikington to Niagara Junction, Ontario	16.7	1,164,000
Willowbrook, northwesterly, Saskatchewan	22.0	616,000
Weyburn to Radville, Saskatchewan	22.7	570,000
Sturgis to near Peesane, Saskatchewan	100.0	8,395,000
Shellbrooke or near Parkside, westerly, Saskatchewan	87.0	1,200,000
Turtleford, 67 miles southeast, to between Hafford and Richard, Saskatchewan	85.6	1,180,000
Kindersley to Gidden, Saskatchewan	18.0	640,000
Spruce Lake, near westerly, Saskatchewan	29.5	990,000
Hudson Bay Junction, southerly, to meet proposed Sturgis-Peesane line, Saskatchewan	82.0	1,088,000
Elk Point, easterly, Alberta	19.0	745,000
Ashmont to Bonnyville, Alberta	88.0	1,415,000
Bretons to Clover Bar, Alberta	11.0	819,000
Total	451.2	18,550,000

The Dominion government definitely decided upon Fort Churchill as the terminal of the Hudson Bay Railway, following the recommendation of Frederick Palmer, the British expert, who was engaged to investigate the respective advantages of that port and Port Nelson. Such a decision was reached because practically unlimited shipping accommodation can be provided and at a minimum cost; borings recently taken over an extensive area show easily dredged material and no rock within 50 feet of the low water level; it is superior to Nelson in safety, cost of construction and economy of time; and it is accessible for 30-ft. vessels at all stages of the tide. The railway will not likely go to Nelson, but will branch off at the present end of steel and proceed to Churchill. This will involve the construction of some 70 additional miles of railway at a cost of \$5,000,000, but the economies effected on the harbor improvements and aids to navigation will more than compensate for this outlay. The cost of laying steel to the bay, providing adequate terminal facilities, and a grain elevator at Churchill and establishing the necessary aid to navigation in the Straits it is estimated

will not exceed \$20,000,000. Something like \$22,000,000 has already been expended on the project.

GOVERNMENT. Executive power is exercised in the King's name by the Governor-General of Canada, acting through a responsible ministry or cabinet. Legislative power is in a Parliament of two houses: a Senate and House of Commons, the former consisting of 96 members appointed for life and the latter of 245 members under the representation act of 1924, elected for five years (unless sooner dissolved) by popular vote, including woman suffrage. Women are eligible for election to Parliament. The Governor-General in 1927 was Viscount Willingdon. As a result of the election of Sept. 14, 1926, the House of Commons was constituted as follows: Liberals, 118; Conservatives, 91; Liberal-Progressives, 11; United Farmers of Alberta, 11; Progressives, 9; Labor, 3; and Independent, 2. The cabinet as formed on Sept. 25, 1926, was as follows: Prime Minister, Secretary of State for External Affairs, President of the Privy Council, William Lyon Mackenzie King; Finance, James A. Robb; National Defense, Col. J. L. Ralston; Postmaster-General, Peter J. Veniot; Soldiers' Civil Re-establishment and Public Health, James H. King; Justice and Attorney-General, Ernest Lapointe; Customs and Excise, W. D. Euler; Marine and Fisheries, Pierre J. A. Cardin; Secretary of State, Fernand Rinfret; Railways and Canals, Charles A. Dunning; Interior, Indian Affairs, and Mines, Charles Stewart; Agriculture, William R. Motherwell; Public Works, John C. Elliot; Trade and Commerce, James Malcolm; Solicitor-General, Lucien Cannon; Immigration and Colonization, Robert Forke; Labor, Peter Heenan; Minister without Portfolio, Raoul Dandurand.

HISTORY

GENERAL EVENTS. As noted in the preceding **YEAR BOOK** the Canadian government appointed a Minister to the United States in the person of Vincent Massey, a wealthy manufacturer. The United States reciprocated early in February, when William Phillips, former Ambassador to Belgium, was appointed to the post of Minister at Ottawa. As an example of the type of matters which would be handled by the respective ministers of the two countries is the protest of Mr. Massey against the decision of the Labor Department of the United States to classify as immigrants all those Canadians who daily cross the international border to work. This new regulation hit the Windsor district of Canada particularly hard, inasmuch as many workers came over from Canada to the automobile factories of the United States. The new regulation was to go into effect on December 1, and would exclude all of those who could not get quota provisions by that time.

July was a month of celebrations. On the first the sixtieth anniversary of the formation of the Dominion was celebrated with fitting ceremonies at Ottawa, which were broadcast throughout the land. King George sent a felicitous message in which he stated that Canada now "has to take an ever increasing share in guiding the councils and solving the problems of the great commonwealth of which she is a part, conscious that within it there is perfect freedom and that the unity of the nations of the British Empire is the surest guarantee of peace in the world today." In the latter part of the month the Prince

of Wales, Prince George, and Prime Minister Baldwin of Great Britain visited Canada and were everywhere royally welcomed, even the French of Quebec taking a conspicuous part in the celebrations. The key speeches dealt with the importance of unity in the Empire, the position of Canada in international affairs, and the significance of the British Crown, which "stands above all distinctions of country, race or party and serves to mark the unity in which all such differences are transcended." In the first week of August the distinguished visitors joined with Vice President Daves, Secretary of State Frank B. Kellogg, Governor Smith of New York, from the United States, and Prime Minister Mackenzie King of Canada, in dedicating the new international bridge between Buffalo, N. Y., and Fort Erie, Ontario.

For the election of Canada to a seat in the Council of the League of Nations on September 15, see **LEAGUE OF NATIONS**.

THE QUESTION OF THE CANADIAN SENATE. An important conference of all the Prime Ministers and representatives from their cabinets of the various provinces of Canada was held at Ottawa in the fall. Prime Minister King called the conference for the purpose of discussing the reformation of the Canadian Senate and the right of Canada to amend her own constitution. The question of the reform of the Senate had been before the public for some time, but it was one of those questions which could be discussed academically without arousing any passion or demands for immediate action. The Canadian Senate as originally formed was organized somewhat along the lines of the British House of Lords. The Senators are appointed for life, and theoretically are supposed to be called from among the "elder statesmen" whose age and wisdom would have a tendency to cool the popular passions of the members of the House. As a matter of practice, however, when a vacancy occurs, the party in power selects one of its own friends, regardless of qualifications, and gives him a life post at \$4000 a year. Incidentally, one of the Senators was 100 years old. Although the Senate is limited as in the United States with regard to initiation of financial measures, it can check the government's programme to a very serious degree in other matters.

Premier King had always been more or less interested in Senate reform, particularly at this time because the Senate had a majority of the parties which opposed him, and the only way he could possibly overcome this majority was by waiting until vacancies occurred. Any constitutional change, under the Dominion Act of 1867, must receive the consent of the British Parliament, which has never refused, on the other hand, to approve constitutional amendments placed before it. Many different methods of selecting the senators have been suggested. The one that Mr. King probably favored was the limiting of the term of appointment to a definite number of years and the actual selection of men because of their mental and cultural attainments. Generally speaking, the western provinces at this conference were in favor of changing the method of selection of the senators, while the more conservative eastern provinces seemed loath to interfere with a system that had been in effect for such a long time. Quebec, the home of the active French minority, was particularly opposed to any change for fear that she might

lose some of the safeguards she now has. As stated above, this question in purely academic, and no tangible result was gained at the conference, but it was thought that, through the exchange of ideas, Mr. King may have obtained enough material to work out a formula, which at one and the same time might appease the radical west and allay the fears of the conservative east. See CELEBRATIONS.

CANADA, ANNIVERSARY OF UNION OF BRITISH COLONIES. See CELEBRATIONS.

CANADA, THE UNITED CHURCH OF. Under this designation a single body was formed in 1925 by the union of the Congregational Churches, the Methodist Church and the Presbyterian Church in Canada. The Methodist Churches of Newfoundland are included and form one of the Conferences. The Churches in Bermuda form a Presbytery. There were in 1927, 11 Conferences and 115 Presbyteries in Canada, Newfoundland and Bermuda, the territories embraced within the Church. During the period between the date of consummation and the end of 1927, according to report of the Board of Home Missions, 149 new fields, including 600 preaching stations, were opened in northern and western Canada, while 278 aid-receiving charges became self-sustaining; 410 unions of two or more congregations ministering in the same localities were effected, thus reducing by 410 or more the number of competitive churches in Canada. Such local amalgamations continued to take place from time to time.

Standing committees on negotiations looking to union with other communions, on worship and ritual, on church architecture, on law and legislation, employed workers, transfer of ministers between conferences, relation to various churches and on preparation of a manual of constitution and government, were at work during the year. A commission was appointed to report to the next General Council on courses of study and theological training for the ministry.

General statistics for the year ending Mar. 31, 1927, contained these returns: Number of members of sessions, 21,597; stewards or managers, 32,314; other members of official boards, 17,813; persons under pastoral oversight, 1,465,540; Sunday schools, 5722, with 610,958 members; young people's societies, 3903, with 113,322 members; Women's Missionary Societies, 3075, with 112,009 members; women's associations, 4115, with 113,740 members. The value of all buildings and lands was \$77,210,112, exclusive of foreign mission properties and properties under control of college and other boards of the Church. The amount raised for maintenance and extension fund was \$2,813,930, and the grand total raised for all purposes, \$15,253,079. Legislation during the year changed the close of the church year to December 31, for the future. It was decided to hold the third General Council, or supreme court of the Church, in Winnipeg, on the first Wednesday of September, 1928.

The principal boards of the Church were: Board of Foreign Missions; Board of Home Missions; Board of Education; Board of Evangelism and Social Service; Board of Religious Education; and Board of Publications. In addition, there were Committees on Finance; on Literature, General Publicity and Missionary Education; and on Maintenance and Extension Fund. Foreign missions were conducted in Central India, Trinidad, Korea, Japan, three regions

of China and in Angola (Portuguese West Central Africa). Visitation of the foreign fields was undertaken during 1927 by delegates appointed by the Executive Committee of General Council. The Moderator and Rev. W. T. Gunn, M.A., D.D., Editor of the *Record and Missionary Review*, attended the golden jubilee of the Central India Mission. The Moderator and Rev. Principal A. Gandier, D.D., visited China, Korea and Japan.

The official organ of the Church is *The New Outlook*, published by The United Church Publishing House, Toronto. The *Record and Missionary Review* is a monthly of value in relation to the general missionary and benevolent enterprises. Copies of the *Basis of Union*, on which the three Canadian Churches united to institute the present Church are obtainable from the Secretary of the General Council. The general officers of the Church for 1927 were: Moderator, the Rev. James Endicott, D.D.; secretary of the General Council, the Rev. T. Albert Moore, D.D., 421 Wesley Buildings, Toronto 2, Ontario; treasurer, the Rev. Robert Laird, D.D., Toronto.

CANALS. WELAND SHIP CANAL. In 1927 all of the various sections of the new ship canal under construction by the Canadian government between Lake Erie and Lake Ontario were well under way and marked progress was being made. The harbor work at Port Weller and Locks 1, 2, and 3 with the intervening canal prism had been completed except for the service gates and the lock-operating equipment. The twin Locks 4, 5, and 6 were almost completed, involving as they did an elaborate lock structure; while single lock No. 7 had been practically finished. Guard Lock No. 8 at Port Colborne was reported 90 per cent completed; while the excavation for the intermediate sections of the canal prism and the construction of embankments were well advanced, the former ranging from 35 to 96 per cent completed, and the watertight embankments were about 50 per cent completed. The whole breakwater extension at Port Colborne had been built, while during the year four 80-foot rolling-lift bascule type bridges were completed, and also one 200-foot vertical lift bridge. Contracts for three more bridges were awarded during the year, and the construction of one 200-foot double-lift bascule bridge was in progress. At the end of the year estimates were made that the Welland Canal could be used by upper lake freighters from Lake Erie to Lake Ontario in the summer of 1930, and that by 1929 certain portions of the north end could be employed for the diversion of existing canal traffic. The total estimated cost of the entire project was \$115,000,000, and at the end of the year the expenditures had aggregated \$86,000,000.

ILLINOIS WATERWAY. Progress was recorded on the important project for the waterway 63 miles in length under construction by the State of Illinois from the Chicago Drainage Canal at Lockport, Ill., to the Illinois River at Starved Rock. This canal would be an element in the proposed barge waterway between Lake Michigan and the Mississippi River providing a channel 200 feet wide with 9 feet depth and with five locks 110 x 600 feet, the first having a lift of 41 feet. At Marseilles and Lockport the locks were already completed, and at the end of the year the Starved Rock lock and the dam were reported 70 per cent completed. Progress was

made in the construction of the Brandon Road lock, dam, and pool; while the remaining lock and dam, of the Marseilles diversion canal, was scheduled for construction in 1928. Contracts were awarded during the year for the valves and mitre gates for the Lockport and Marseilles locks. From the progress made it was believed that the new waterway would be completed in 1930. As stated, this canal would connect with the Illinois River, and the United States Congress in 1927 authorized the construction of a 9-foot channel from the end of the waterway at Starved Rock to the Mississippi River.

The River and Harbor Act of 1927 passed by the U. S. Congress carried a modified project for the improvement of the Port Arthur Canal and Sabine-Neches Canal by widening these waterways from Sabine dam up to the mouth of the Neches River. This project was adopted subject to the condition that local interests would aid the work by providing necessary rights of way and dumping grounds, would protect the United States against any damage claims, and would maintain that part of the Beaumont Turning Basin which lay within 75 feet of all municipal wharves. Furthermore, the Secretary of War was authorized to receive moneys from local interests and such were forthcoming by the end of 1927.

MEUSE-WAAL CANAL. On October 27 the Meuse-Waal Canal, which forms the principal link of the improved waterway between Nimègue and Maastricht, running from Mook on the River Meuse in the southern Province of Limburg to a point near Nimègue in the northern Province of Gelderland, was opened in the presence of the Queen of Holland. This canal which provided a new waterway between Limburg, an important industrial section in which also were situated the coal mines, and the eastern and northern part of Holland, was made possible by the appropriation on June 15, 1915, of 12,000,000 florins (\$4,824,000). The canal shortens the communication between Limburg and northern Holland by 50 miles and is part of a plan projected by the Netherlands government to improve the navigable use of the River Meuse as a means of connection between important centres of the Kingdom. The canal is about 8 miles long, with a breadth at the surface of 162 feet, a width at the bottom of about 108 feet, and a depth of 13 feet. It is navigable for vessels of 2,000 tons having a length of 327 feet, a breadth of 39 feet, a maximum depth of 9 feet, and a height above the water surface of 22 feet. Its locks are 855 feet by 52½ feet internally and accommodate two large Rhine barges and a tug in line. Another portion of the new waterway was the canalization of the River Meuse and the Juliana Canal. Five locks with weirs had been built in a length of about 67 miles of the River Meuse and the new waterway had become one of the finest for barge navigation in Europe. It had cost Holland nearly \$2,000,000 for its construction and improvement.

During the year work was in progress on the enlargement of the Amsterdam Ship Canal between Ymuiden and Amsterdam, and the new lock which affords entrance to the Canal at Ymuiden was nearly finished. This lock was the largest in the world and its three steel rolling caissons had been launched and were being erected in place at the end of the year.

RHINE CANAL. The improvement of the upper reaches of the Rhine above Strassburg was be-

gun in 1927, after a long discussion in which the Treaty of Versailles figured, as under that convention the French were authorized to build a lateral canal alongside the Rhine between Basle and Strassburg and to draw water from the river for the production of electric power. Previously the Swiss had constructed an inland port at Basle in anticipation of the improvement of the river channel below that town. After considerable discussion the Central Commission of the Rhine approved both the carrying out of river improvements by Switzerland and Germany and the construction by France of the lateral canal which must be navigable and as free as the river itself. The first section of this canal between Basle and Kembs was begun by France with the concurrence of Switzerland during the year and it was expected to be completed in 1932, the project including a power station. This section would avoid the Istein rapids below Basle and the canal with its lock would accommodate Rhine barges of over 1200 tons capacity. Consequently it was doubtful whether river improvements would be undertaken in view of adequate facilities being provided by the canal.

See PANAMA CANAL; SAULT STE. MARIE, CANALS AT; SUEZ CANAL.

CANARY ISLANDS. A group of small islands off the northwest coast of Africa, belonging to Spain. Area, 2807 square miles; population, Jan. 1, 1926, estimated at 509,287. The capital is Santa Cruz de Tenerife, with an estimated population in 1925 of 67,144. The next largest city is Las Palmas, with a population of 67,122 in 1920. The University of Seville maintains an educational establishment in the Canaries and is in charge of higher education. There is regular steamship communication with Spain. The islands are under the administration of continental Spain, through a local governor.

CANBERRA. The new federal capital of Australia (q.v.)

CANCER. A brief article in the *Weekly Bulletin* of the City of New York Department of Health for Sept. 3, 1927, analyzes the figures which appear to show an enormous increase of cancer in the metropolis since 1898, namely from 61 per 100,000 residents in that year to 119 in 1926. In other words according to crude figures the death rate had nearly doubled. It is however necessary to correct these figures on a basis of age distribution, as is done in all mortality statistics, for the incidence of disease varies with age grouping. The adjusted figures thereby obtained show that the actual as contrasted with the apparent increase during this age period beginning with 1901 (no figures given for 1898) was from 78 to 108, a matter of 40 per cent in place of nearly 100. But this is not all, for it is possible to make other adjustments—for example in the case of non-residents who die of cancer in institutions within the city limits—which bring down the increase to 36 per cent. While this may represent a true increase it is believed that much of it can be explained by better diagnosis and better death certificates. Having made all possible deductions it seems reasonable to suppose that there is a true increase although it is not so formidable as has been thought and not sufficient to cause any phobias on the part of the general public. Doubtless the elderly have always been menaced by the risk of cancer.

An editorial in *The Lancet* (London) for July 16, 1927, is one of several to appear during the year on the increasing frequency of cancer of the lungs or rather bronchi. Moreover it seems certain that cancer in this site is, like cancer of the lip and tongue, largely a matter of sex, habit and occupation for it occurs predominantly in males and in men who are especially exposed to dust and fumes which are known to possess the power of changing the columnar epithelium of the bronchi to the squamous form. The increased incidence seems to be associated with workers in dust of all kinds; with men who have much to do with road traffic and hence inhale the emanations from motors and from roads treated with tar, etc.; with smokers, possibly with increased risk of inhaled smoke through change from pipes and cigars to cigarettes. It has also been suggested that increased incidence may have been determined in part by the pandemic of influenza of 1918-19. It seems probable also that certain malignant growths heretofore termed extra-bronchial, and regarded as sarcomata, are in reality examples of cancer originating in the bronchial tubes. The total number of these intrathoracic growths of all kinds was still small, for during the previous six years but 148 had been registered at the Manchester (England) Royal Infirmary.

Numerous reports from those who have tested the Blair Bell lead treatment of cancer appeared during the year and the tenor differed within wide limits, but on the whole they were disappointing. One opinion was that at most the lead does no more than sensitize the cancer cells to the action of the Röntgen rays and can be regarded only as an adjunct to radiotherapy. Others speak of a specific anti-cancerous action of the metal and of the additional ability of the treatment to cause thrombosis of the tumor blood vessels. There is a consensus of opinion that the treatment does inhibit the tumor growth in a certain per cent of cases but thus far it was impossible to determine in advance the type of tumor to benefit by the treatment. Some authors gave prominence to the severe anemia which resulted from the injections and to other specific symptoms of lead poisoning which are sufficient for the condemnation of the treatment. There were differences of opinion as to the dosage, for while Bell himself advocated rather large, well spaced doses the majority preferred the small repeated dose. Thus far the colloidal preparations in use had been without standardization and were moreover very unstable; they represented mixtures of metallic lead and its combinations which undergo a variety of changes in the blood. It was therefore impossible to understand the mechanism of the action of the metal, whether for good or ill.

CANEVIN. THE MOST REV. JOHN FRANCIS REGIS. Roman Catholic Bishop, died at Pittsburgh, Pa., March 22. He was born in Westmoreland County, Pennsylvania, June 5, 1852, and after studying at St. Vincent's Seminary in the same county was ordained priest June 4, 1879. He became rector of St. Mary's Roman Catholic Church in Pittsburgh, and from 1881 to 1886 was attached to the cathedral of that city. In the latter year he was made chaplain of St. Paul's Orphan Asylum, the Pennsylvania

From 1888 to 1893 he was connected with the cathedral as chancellor of the diocese, and in the latter year became rector of St. Philip's Church at Grafton, Pa. In 1895 he returned to the cathedral as its rector, and, on Feb. 24, 1903, was consecrated titular Bishop of Sabrata and Coadjutor Bishop of Pittsburgh with right of succession to the see; he succeeded Bishop Phelan, who died in 1904. With a diocese composed of half a million Roman Catholics of various nationalities, he caused services to be conducted in 14 languages, and was eminently successful in his administrative duties. He resigned as Bishop of Pittsburgh on Nov. 20, 1920, and in 1921 was made titular Archbishop of Pelusium.

CAPE COLONY. See CAPE OF GOOD HOPE PROVINCE.

CAPE OF GOOD HOPE PROVINCE. One of the four original provinces of the Union of South Africa; the southernmost province of the Union; formerly known as Cape Colony or the Colony of the Cape of Good Hope. Area, 276,536 square miles; population at the census of 1921, 2,781,542, of whom only 650,327 were European. The population at the census of 1911 was 2,564,905. The chief towns with their white population in 1921 were: Cape Town, 113,302; Kimberley, 13,288; Port Elizabeth, 25,982; East London, 20,374. The movement of population in 1925, so far as registered, was: Births, 55,350; deaths, 33,004; marriages, 14,427. In 1926 there were 112 local school districts. In 1925 there were 4509 aided schools with 135,955 European pupils, 174,295 non-European pupils, and 10,839 teachers. The trade between the province and the United Kingdom in 1926 was: Imports into the United Kingdom from the province, £12,385,897; exports from the United Kingdom into the province, £14,663,087. The chief exports to the United Kingdom were wool, mohair, hides and skins, corn, and feathers; the chief imports from the United Kingdom were cotton and woolen goods, machinery, iron and steel goods, and paper. The administrator of the province in 1927 was A. P. J. Fourie. See SOUTH AFRICA, UNION OF.

CAPE VERDE, VÍRD, ISLANDS. A group of 14 islands off the western coast of Africa belonging to Portugal. Area, 1480 square miles; population at the census of Dec. 31, 1922, 149,793, of whom 69,001 were males. The chief products are coffee, medicinal substances, hides, and millet. A small military force is maintained on the islands. The estimated public revenue in 1926-27 was 17,504,815 escudos and the expenditure, 17,111,699 escudos. Imports in 1924 amounted to 68,208,277 escudos and exports, 4,740,120 escudos. The chief port is Bissau. The administration is in the hands of a governor whose seat is at Praia, the capital.

CAPPER RESOLUTION. See ARBITRATION, INTERNATIONAL; PEACE AND PEACE MOVEMENTS.

CARDIAC GLINIOS. See HEART DISEASE.

CARINTHIA. A province of the republic of Austria; formerly a crownland of the Austro-Hungarian Empire. Area, 3680 square miles; population at the census of 1923, 370,748, as compared with 396,200 in 1910. Carinthia, in 1923, had 5.67 per cent of the total population of Austria. Capital, Klagenfurt, with a population in 1923 of 27,423.

CARLOTTA. See CHARLOTTE, PRINCESS.

CARNEGIE CORPORATION OF NEW

tered under the laws of the State of New York, June 9, 1911, this corporation was formed for the purpose of promoting "the advancement and diffusion of knowledge and understanding among the people of the United States." The original endowment was \$125,000,000, an amount to be increased upon the final settlement of Mr. Carnegie's estate. The income of this principal fund is applicable only within the territorial limits of the United States, but the Corporation holds also a special fund of \$10,000,000, of which the income is applicable in "Canada and the British colonies." The programme of the Corporation in 1927 was concerned chiefly with library service, the place of the arts in American life, adult education, scientific research, and educational studies. Although the Carnegie Corporation is an educational foundation, it is not an operating agency, and its activities are limited to financial cooperation with existing institutions and associations.

The outstanding feature of the year was the decision on the part of the Trustees to devote approximately two-thirds of the annual income to a reduction of unpaid obligations, which on Sept. 30, 1926, stood at \$29,612,212.53, and which had been reduced under the policy adopted to \$25,518,014.99, on Sept. 30, 1927. The annual report of Dr. Frederick P. Keppel, President of the Carnegie Corporation, showed that during the fiscal year ended Sept. 30, 1927, the sum of \$2,187,644.76 was appropriated toward (1) The support and development of library services, \$84,000; (2) The encouragement of organizations dealing with adult education, \$122,600; (3) The support of national organizations in the field of fine arts and of departments of arts in colleges and universities and of projects for developing appreciation of arts and music, \$465,500; (4) The support of educational studies, scientific research, \$806,500; (5) Various special enterprises, including the Carnegie Endowment for International Peace, Institute of International Education, \$470,190.60; (6) and various interest annuities pending payment of endowments to colleges and other educational organizations.

The Corporation continued its policy of making scholarship grants to graduate students who proposed to become college teachers of the arts, and ended its programme of distributing sets of arts teaching equipment to colleges. It continued to support various important projects, such as research in purification of insulin, investigation of high-frequency rays of cosmic origin, cooperative research in pyorrhea and otosclerosis, and study of the susceptibility to infectious diseases. Various studies conducted by the Society for the Promotion of Engineering Education, the Modern Language Association, the Institute of Economics, and the American Law Institute were continued through the year.

The Trustees of the Corporation are: James Bertram, Nicholas Murray Butler, Louise M. Carnegie, John J. Carty, Samuel Harden Church, Robert A. Franks, William J. Holland, Frederick P. Keppel, Russell C. Leffingwell, John C. Merriam, John A. Poynton, Henry S. Pritchett and Elihu Root. Officers of Administration: Elihu Root, chairman of the board; Robert A. Franks, vice chairman and treasurer; Frederick P. Keppel, president; James Bertram, secretary;

and Robert M. Lester, assistant to the president. The headquarters are located at 522 Fifth Avenue, New York.

CARNEGIE INSTITUTE. See ART EXHIBITIONS.

CARNEGIE INSTITUTE OF TECHNOLOGY. A non-sectarian institution for technical education at Schenley Park, Pittsburgh, Pa.; founded in 1900. The enrollment for the autumn of 1927 was 5925, including 2400 registered in the regular day courses, and 3525 in the evening courses. For the summer session 665 students were registered. The faculty numbered 355, of whom 265 were on full time, and 90 on part time. The endowment of the institution was \$15,399,412.76, and the annual income \$788,040.48. The institute has a campus branch of the Carnegie Library of Pittsburgh which has 450,000 volumes. President, Thomas Stockham Baker, Ph.D., LL.D.

CARNEGIE INSTITUTION OF WASHINGTON. An organization founded in 1902 to encourage broad and liberal investigation, research, and discovery, and the application of knowledge to the improvement of mankind. The results of its investigations are made known through the scientific journals, the Institution's *Year Book*, a series of monographs which it issues, and other regularly established channels. During the year the Executive Committee authorized the publication of 15 volumes, at an estimated cost of \$56,700, including the *Year Book*, George Sarton's *Introduction to the History of Science*, E. E. Barnard's *Atlas of Selected Regions of the Milky Way*, *Contributions to Embryology*, John S. Bassett's *Correspondence of Andrew Jackson*, *Contributions to Palaeontology from the Carnegie Institution of Washington*, devoted to the palaeontology of the Pacific Coast and Great Basin Regions of North America, and *Land Magnetic and Electric Observations* by H. W. Fisk and H. U. Sverdrup.

A careful study was made by the Institution of its plant biology programme and a plan adopted whereby unification, coöperation, and concentration were effected in administering significant researches in that field. Researches in plant biology had been carried on during the two decades previous to determine the relation of life process to environment, problems of plant heredity, the influence of environment, etc., in order to advance the boundaries of knowledge in the subject. The Institution continued its policy of giving its investigators opportunity for contact with those in related fields, by sending representatives during the year to significant international meetings in which results of its own researches were presented for discussion and conferences were held with leading students in other parts of the world. In furtherance of the Institution's work in history of early American cultures, Dr. Alfred V. Kidder, of the Archaeology Department of Phillips Academy, Andover, Mass., was appointed as Associate of the Institution in Early American History, in order that he might have the opportunity of coöperating with Dr. Morley in extending and developing archaeological and anthropological studies. Excavations in 1927 included two small structures of great interest and beauty in the Maya city of Chichen Itzá, in Yucatan. In the Warriors' Temple, one of the most beautiful buildings so far discovered in the Maya region, a second temple was discovered beneath the floor

of the main structure, thus complicating the problems of the excavations, which were being carried on under the direction of Earl Morris.

At the annual meeting in December the Board of the Carnegie Institution authorized a three-year cruise of the non-magnetic yacht *Carnegie* to continue special studies in terrestrial magnetism, atmospheric electricity, and certain general problems in physical oceanography. The programme for the repairing, equipping and operating of the *Carnegie* was made possible through additions to the endowment fund of the Institution from the Carnegie Corporation of New York and through the generous aid and coöperation of departments of the government.

Although the Institution had been responsible for 24 years for preparing and publishing the *Index Medicus*, of literature relating to subjects which concern medicine and medical research, the *Index* was taken over in 1927 by the American Medical Association for joint publication with the *Index* of the Association, the joint venture to be known as the *Quarterly Cumulative Index Medicus*, the Institution to coöperate in meeting expenses for a limited period of time.

The aggregate sum of \$74,000 was received in gifts during the year for the support of specific projects in mathematics, chemistry, physiology, genetics, seismology, geology and archaeology, in recognition of the significant investigations carried on by the Institution. The total receipts for the year ending October 31, amounted to \$33,676,020.45, while the expenditures totalled \$33,386,135.32. The real estate and equipment were valued at \$3,554,109. Three vacancies on the Board of Trustees created by the deaths of George J. Baldwin, Dr. Charles D. Walcott and Henry White, were filled by the election of Frederic A. Delano of Washington, D. C., Homer L. Ferguson of Newport News, Va., and William Church Osborn, of New York City. Officers for 1927 were: President, John G. Merriam; chairman, Board of Trustees, Elihu Root; vice chairman, Dr. Henry S. Pritchett; secretary, W. Cameron Forbes.

CAROLINE ISLANDS. See GERMAN NEW GUINEA.

CARPENTER, JOSEPH ESTLIN. British Unitarian theologian, died at Oxford, June 2. He was born in 1844, and was educated at the University College School in London, and at the University and Manchester New Colleges. Becoming a Unitarian clergyman, he was minister at Oakfield Road Church, Clifton, 1866-69, and at Mill Hill Chapel, Leeds, 1869-75. In the latter year he was called from the active ministry to become a teacher in Manchester College, London and Oxford, where he served for forty years. He first taught Old Testament and Hebrew, ecclesiastical history and comparative religion, and on the retirement of Dr. James Martineau as principal in 1885 Dr. Carpenter was elected vice-principal under Dr. James Drummond. In 1889 Manchester College was moved to Oxford and Dr. Carpenter went with it, being active in teaching until 1899, when he resigned the vice-principalship and his professorship, retaining only the Case Lectureship in Comparative Religion. This enabled him to devote himself extensively to writing, and he was the author of a notable series of theological and historical works. In 1906, when Dr. Drummond

retired, Dr. Carpenter became principal and resumed his active lecturing, teaching not only the New Testament but also comparative religion. In 1915, when he relinquished the office of principal of Manchester College, he continued his Wilde Readership at Oxford. He received an honorary degree of D.D. from Glasgow, and that of doctor of theology from the Universities of Jena and Geneva. His publications, involving original scholarship or editorial work, included the following: *Ewald's History of Israel*; translation of Tiele's *Outlines of the History of Religion*; *The Life and Work of Mary Carpenter*; *Life in Palestine*; *The First Three Gospels, their Origin and Relations*; *The Bible in the Nineteenth Century*; *James Martineau, Theologian and Teacher*; *Phases of Early Christianity*; *Theism in Medieval India*, and other works. He was joint editor, with Prof. Rhys Davids, of *Digha Nikāya*, and the *Sumangala Vilāsi*; *Buddhism and Christianity*; joint editor, with the Rev. G. Harford-Battersby, of *The Hallelujah According to the Revised Version*; and joint author with the Rev. P. H. Wicksteed, of *Studies in Theology*.

CARSON, JOHN FLEMING. American clergyman, died at Stony Brook, N. Y., September 2. He was born at Philadelphia, Pa., Jan. 28, 1860, and, after taking the degree of B.A. at the University of Pennsylvania in 1881, graduated from the Allegheny Theological Seminary in 1885, being ordained to the ministry on May 20 of that year. He was at first pastor of the First Reformed Presbyterian Church of Brooklyn, N. Y., and in 1892, when he decided to become a regular Presbyterian minister, a portion of his congregation supported him and bought out the interests of other members of the church, which became known as the Central Presbyterian Church. He was the moderator of the General Assembly of the Presbyterian Church, 1911-12, and chairman of the National Service Commission of the Presbyterian Church in the United States of America. He was president of the Stony Brook School for Boys and of the Stony Brook Assembly. He wrote: *Married Life in Sacred Story* (1897); *The Bible and Infidelity* (1899); and *The Word of Authority* (1914).

CASANOWICZ, IMMANUEL MOSES. Orientalist and assistant curator of old world archaeology of the United States National Museum at Washington, D. C., died at Washington, September 26. He was born at Zholudok, Russia, July 25, 1853, and studied at the Evangelische Predigerschule and the University of Basle, Switzerland, 1876-83. He was an instructor in Latin and Greek at the Evangelische Predigerschule, at Basle, 1880-81, and an instructor in Hebrew and church history at the German Theological School of Newark, at Bloomfield, N. J., 1883-86. He received the degree of Ph.D. from Johns Hopkins University in 1892, and became associated with the United States National Museum as assistant curator of the division of old world archaeology. In addition to being a member of the American Oriental Society, he was vice president of the Anthropological Society of Washington. Among his writings, which included bulletins and articles in learned periodicals, is: *Paronomasia in the Old Testament* (1894).

CASE SCHOOL OF APPLIED SCIENCE. An engineering college at Cleveland, Ohio; founded in 1881. In the autumn of 1927 the enrollment was 627 students. The faculty numbered 67. The productive funds of the school

amounted to \$4,040,535, and the income for the year to \$342,024. There were 24,000 volumes in the library. A new Mechanical Engineering Laboratory, costing about \$500,000, was finished during the year. President, Charles Sumner Howe, Ph.D., D.Sc., LL.D.

CASUALTY INSURANCE. See **INSURANCE.**

CATHOLIC CHURCH. See **ROMAN CATHOLIC CHURCH.**

CATHOLIC UNIVERSITY OF AMERICA.

An institution of higher education at Washington, D. C.; founded in 1887. It includes graduate schools of sciences, law, and philosophy. Affiliated with it are the Catholic Sisters College for the training of teachers, Trinity College for young women, and the houses of study of 20 religious orders. The enrollment for the autumn of 1927 was 901, distributed as follows: School of theology, 94; school of canon law, 50; school of law, 15; school of philosophy, 438; school of letters, 76; school of sciences, 228. In the 1927 summer school there was an enrollment of 405. There were 116 members of the faculty, of whom 31 had the rank of professor, one promotion having been made from the rank of associate professor during the year. The productive funds amounted to \$2,903,499.48, and the income for the year to \$694,320.49. Among the important gifts of the year was an additional \$100,000 from John K. Mullen of Denver, toward the erection of the John K. Mullen Memorial Library, which was under construction; and an additional \$50,000 from the Hierarchy of the United States for the erection of a home for ecclesiastical professors. The library contained 262,000 volumes. Rector, Rt. Rev. Thomas J. Shahan, S.T.D., J.U.L., LL.D., Titular Bishop of Germanicopolis.

CATTLE. See **LIVESTOCK; VETERINARY MEDICINE.**

CATTLE TICK ERADICATION. See **VETERINARY MEDICINE.**

CAUCASUS, kă'kă-sūs. A term applied to the indefinite region in southeastern Europe, comprising the isthmus which separates the Sea of Azov and the Black Sea from the Caspian Sea; formerly a government of the Russian Empire. It was divided into two districts of Trans-Caucasia and Cis-Caucasia, of which the former was divided among the three republics of Armenia, Georgia, and Azerbaijan (qq.v.). These afterwards separated and were respectively incorporated under the constitution of 1923 in the Union of Soviet Republics, and are now known as the Transcaucasian Federation of Soviet Republics.

CAVALRY. See **MILITARY PROGRESS.**

CAVANAUGH, COLONEL JAMES B. American military engineer, died at Coronado, Cal., April 26. He was born in Illinois in 1870; his family moved to Olympia, Wash. He was appointed to the United States Military Academy, graduating in 1892, being commissioned in the Corps of Engineers and studying at the Engineers' School of Application, from which he graduated in 1895. After service at Detroit, Mich., and Mobile, Ala., on river and harbor improvements and fortification work, in 1900 he was ordered to the Philippines on road and other construction, and in the following year was assigned to Fort Leavenworth, Kan. In 1907 he was made assistant to the Chief of Engineers at Washington, D. C., and in 1911 he was placed in charge of the Puget Sound District

in the State of Washington, where he brought to a successful completion the Lake Washington Canal at Seattle, designing the government locks. During the World War he organized and commanded the Eighteenth Railway Engineers, a Pacific Coast organization which was one of the first regiments to reach France and serve actively as a railway regiment. He received the Distinguished Service Medal. On his return from France he was district engineer of the Nashville, Chattanooga and Florence districts. He retired from the army in 1922.

CELEBRATIONS. The items presented under this heading in 1927 as in the years immediately preceding continue to be for the most part sesqui-centennial celebrations of anniversaries of important events associated with the period of the War of the Revolution. They were accompanied by a growing interest in historic incidents in the development of the United States, and were largely organized under the auspices of the patriotic societies that were the outcome of the centennial celebrations of fifty years ago.

January 3-5. The one hundred and fiftieth anniversary of the battle of Princeton was celebrated on these dates. The exercises began on January 3, with a meeting in Alexander Hall in Princeton University, at which an historical address was made by Prof. W. S. Myers. In this, after reviewing the events pertaining to the battle, he made a plea for the preservation of the battle field as a memorial. This plan was favorably considered and a large sum of money was promptly subscribed. On January 4, a series of nine tableaux depicting historic events were presented in the Garden Theatre, and on the fifth a banquet given under the auspices of the New Jersey Society of the Sons of the Revolution brought the celebration to an end.

January 5-7. The sesqui-centennial anniversary of the independence of Vermont was celebrated by various exercises, of which a commemorative address descriptive of the early history of the State by John G. Sargent, Attorney-General of the United States, delivered in Montpelier, was the most important.

January 16-18. The 221st birthday of Benjamin Franklin was celebrated in New York City on the 16th by a pilgrimage to the Hall of Fame where the bust of Franklin was decorated with flowers and addresses were made. On the 17th memorial wreaths were placed on the statue in Park Row by representatives of various patriotic societies. The week beginning with January 16 was sponsored as Franklin Week by the International Advertising Association.

April 19. The observance of Lexington Day in New York City began at St. Paul's Chapel, where a color escort from four Scout troops stood guard in front of the chapel. When "Paul Revere" and "William Dawes" rode up, the vicar of the chapel handed them a torch, symbolic of liberty, and an American flag. They then stood on opposite sides of the grave of Gen. Richard Montgomery, in the church porch, and as the bells of St. Paul's tolled the two boys placed a lighted lantern of warning on the tablet. This was intended to represent the warning beacons mentioned in Longfellow's poetic version of Paul Revere's ride. Led by a Fifth Avenue omnibus carrying the scout color escort, the two riders proceeded down Broadway to Trinity Church, where a wreath was

placed on the tomb of Alexander Hamilton. Next the procession moved to the Washington statue in front of the Subtreasury Building and then stops were made at other monuments, the last one being at Grant's Tomb on Riverside Drive.

May 1. The one hundred and thirty-eighth anniversary of the inauguration of George Washington as first President of the United States was commemorated by a church service under the auspices of the Sons of the Revolution in St. Paul's Chapel, New York City. Members of various patriotic societies carried a score of flags, replicas of famous battle colors of the Revolution, as they marched into the chapel. The Very Rev. Dr. Howard C. Robbins, Chaplain of the Society, spoke on the character and idealism of Washington and warned his audience of the "disaster that would be involved in forsaking that idealism."

June 14. The Governors of forty States issued proclamations asking that the flag be displayed and suitable exercises be held in honor of the nation's emblem on the 150th anniversary of its adoption. The observation of the day began on June 13 when Dwight Braman, head of the Allied Patriotic Societies, broadcast an address over the radio. Exercises under the auspices of the New York Young Republican Club in New York were also held at the base of the Statue of Liberty on Bedlow's Island. The figure was decorated with flags and through an arrangement of lights it was made to appear as though the great torch were actually burning. The programme included singing, speaking and the laying of flowers at the foot of the statue.

June 16. The 201st anniversary of the first permanent settlement of the Shenadoah Valley was celebrated at Kauffmans Mill, near Luray, Va., in the vicinity of the site of the first permanent settlement. The first settlers were Swiss, in 1726, who were soon followed by English. Inducements were offered by Virginia for locating Indian trading posts west of the Blue Ridge Mountains crossed by Alexander Spotswood in 1716.

July 1. The 60th anniversary of the union of the British Colonies of North America in one dominion was celebrated throughout Canada, but the principal event was in Ottawa. The semi-centennial of confederation was in 1917 but owing to the war a celebration was not thought advisable. In April, 1927, Parliament decided to make July 1, the sixtieth anniversary, a period of rejoicing and thanksgiving that the Dominion had not only survived but increased in area, unity, and world importance. The official exercises began in Ottawa at noon and included the first playing of patriotic airs by the new carillon in Victory Tower on Parliament Hill, which was broadcast throughout the Dominion, the reading of the Diamond Jubilee resolution of Parliament, various addresses, especially one giving the history of the formation of the Dominion by Prime Minister W. L. Mackenzie King and one by the Governor-General, Viscount Willingdon. In the evening an historical pageant passed through the city, illustrating the various phases of national life since Champlain came up the Ottawa River, but dealing chiefly with historical events since 1867. No celebration in the history of Canada has ever aroused such widespread interest. From Cape Breton Island, on the Atlantic, to Vancouver Island, on the Pacific, the Dominion was a mass of color in honor of

the event. Even the Indian and Eskimo settlements in the Far North joined in the celebration.

July 4. The first of New York State's sesqui-centennial celebrations was the one at Crown Point, where tablets were dedicated, and a pageant entitled, "Crown Point—Gibraltar of America" was given. Two seaplanes from the U. S. Navy executed maneuvers over Lake Champlain before Old Fort Crown Point. The speakers included Hanford McNider, Assistant Secretary of War, and Fred L. Porter, Chairman of the Celebration Committee.

July 4. Carleton Island in the upper St. Lawrence River, named after Sir Guy Carleton, and off Cape St. Vincent, was also the scene of a New York State sesqui-centennial celebration. It was on this island, comprising about 1000 acres, that St. Leger camped for several days when advancing toward Fort Stanwix. A bronze marker commemorating this fact was unveiled. Addresses were made by Robert Lansing, Dr. A. C. Flick, State Historian, and Dr. James S. Riggs, President of the New York State Historical Association.

July 4. At Gillespie Gap, near Little Switzerland, N. C., a bronze monument was unveiled to the memory of the patriots from the mountains of upper North Carolina and Tennessee, who passed there on Sept. 20, 1780, on the way to Kings Mountain, where they virtually annihilated the British forces under Lieut.-Col. Ferguson, and also to the descendants of this hardy band who, during the World War, fought against the Hindenburg line as part of the 30th Division. Former Gov. Cameron Morrison was chief speaker.

July 4. A commemoration of the final cessation of warfare between the Iroquois Confederacy and the white settlers of New York took place in Elmira, N. Y., where a boulder with a tablet was dedicated near the spot where the Treaty of Painted Post was signed. The treaty was made at Newtown, now Elmira, in July, 1791, between representatives of the United States government and the Six Nations.

July 18. The 133d anniversary of the attack by the opponents of the excise tax on whisky on the home of Gen. John Neville, collector of internal revenue for the western Pennsylvania district was celebrated at Woodville, near Pittsburgh, Pa. The Neville house which stood on the banks of Chartiers Creek was burned. The leader of the insurrectionists was killed and several were wounded. Prompt action by the government, under Washington, put an end to the revolt.

July 20-21. The 150th anniversary of the historic events connected with the early settlement of Cherry Valley, N. Y., was celebrated with a pageant consisting of ten scenes and participated in by 200 persons, depicting the history of the vicinity, and by the unveiling of a marker to designate the Cherry Valley Turnpike as the first great artery of travel from Albany to the West, chartered in 1799 to run from Albany to the tavern of John Walton in Cherry Valley. Also addresses pertinent to the event were delivered and other exercises were held.

July 28. Near Cuba, N. Y., on lands belonging to the Indian race, representatives of the petroleum industries joined with those of the State of New York, to witness the unveiling of a petrochemical monument, at the side of the

spring and the well where 300 years ago a white man first found oil on the North American continent, and to the site of the first oil well drilled in America. Robert L. Welch, of New York City, secretary and general counsel of the American Petroleum Institute, made the principal address. Other speakers were representatives of the Seneca Indian Nation—Theodore F. Jemerson, Jr., of Brant, N. Y.—and of the Franciscan order, the Rev. Bonaventure McIntyre of the Franciscan Monastery at Winsted, Conn., repeating in a measure the history of three centuries ago, when Father Joseph De La Roche D'Allion, a Franciscan missionary and explorer, was guided to the spot by Indians. A Seneca Indian war dance concluded the ceremony which was under the auspices of the New York State Oil Producers' Association.

August 4. There was staged in Deadwood, So. Dak., a parade and pageant, each depicting the historical past of the old gold-mining town. Miners, bull-whackers, trappers, cowboys, soldiers, Indians, gingham-clad frontier women, and many other long forgotten characters familiar in the early days of Deadwood Gulch participated. This annual celebration of "Days of '76" showed the present Black Hills city transformed into a practical and impressive reproduction of the town as it was in those turbulent days of 50 years ago. It was attended by President and Mrs. Coolidge.

August 6. The first of the celebrations conducted under the auspices of the New York State Department of Education was held near Rome, N. Y., to commemorate the Burgoyne campaign in the Fort Stanwix-Oriskany-Mohawk area. The exercises began with dedication ceremonies at Oriskany, N. Y., including the presentation of the deed to the battle monument and about five acres of land to the State of New York by the Oneida Historical Society. An address was made by G. L. Prescott whose father aided Governor Seymour in erecting the monument in 1884. The Oriskany battlefield and old Fort Stanwix were largely restored for this event. The work of cutting the monument for the inset of bronze carrying the 241 names not known at the time of the original dedication, was done by the Mohawk Valley Historic Society. At Fort Stanwix, the old Brackett house was moved from the site of the fort in the city of Rome and the spot graded and seeded and a State marker dedicated. A pageant, the Siege of Fort Stanwix and the Battle of Oriskany, including the making of the first improvised Stars and Stripes and its use in battle was presented. The principal addresses were made by Dr. Alexander C. Flick, State Historian, and Dr. John H. Finley. The Celebration Committee included Elihu Root as Honorary President, W. Pierrepont White, Chairman, and Donald W. White, Secretary.

Of conspicuous importance in this connection is the settling of the long controversy over the proper name of the old fort near Rome, N. Y., from which was flown for the first time the Stars and Stripes. The War department decided July 16, that it will be officially known as "Fort Schuyler," formerly Fort Stanwix. The results of its investigations, the department announced, showed that "Old Fort Stanwix, which was named after the British General who built it, was rebuilt in 1776 and renamed Fort Schuyler. It was designated Fort Schuyler in a letter from Col. Elias Dayton to General Schuyler

under date of Sept. 22, 1775. In 1777 it was called Fort Schuyler by Colonel Willett and Lieutenant Colbrath, who were present in the fort during its siege by St. Leger, and who left a written record of their experience in 1778. There is, however, evidence to the effect that the place was called Fort Stanwix during the period stated above, because the new designation 'Schuyler' was not generally known.

"The first engagement of American troops under the flag of the Stars and Stripes design has been established as taking place at the old fort, through a similar exhaustive study of sources by the War Department. During the investment of the fort, which began on Aug. 2, 1777, a flag was hoisted by the garrison, which is described as follows in a volume entitled *A Narrative of the Military Actions of Colonel Marinus Willett*: 'The fort had never been supplied with a flag. The necessity of having one had, upon the arrival of the enemy, taxed the invention of the garrison a little, and a decent one was soon contrived. The white stripes were cut out of ammunition shirts, the blue out of the camlet cloak taken from the enemy at Peekskill, while the red stripes were made of different pieces of stuff procured from one and another of the garrison.' The description of the collection of the red, white, and blue materials which were made up into a flag, and the statement that enemy flags captured on Aug. 6, 1777, were displayed under the 'Continental flag,' indicate that the description of the Continental flag was known to the garrison on the day it was raised, and that the flag that floated over the fort was the Stars and Stripes."

August 13. The 150th anniversary of the occasion when Col. John Harper rushed at the head of relief troops to the aid of settlers beset by Indians and Tories retiring from the Battle of Oriskany during the War of the Revolution was celebrated at Cobleskill, N. Y., by a pageant depicting that and other incidents of the time.

August 13. The birthday of Thomas Jefferson was celebrated by a pilgrimage to Monticello, Va., under the auspices of the Jefferson Centennial Commission. Addresses were made by the Hon. William G. McAdoo and Senator Carter Glass, and it was decided to urge upon Congress the recognition of Thomas Jefferson's birthday on April 13 as a national holiday and establishment of a memorial in Washington to the author of the Declaration of Independence.

August 13-16. The sesqui-centennial anniversary of the battle of Bennington was celebrated with much ceremony. The events began with the presentation of a historical "Pageant of Bennington," which was given on the nights of the three days and on the afternoon of the 15th. Special historical services were the conspicuous events of Sunday the 14th. On the 15th bronze markers were dedicated with appropriate addresses on the homes of James Breckenridge, and Lieut.-Col. Frederick Baum, and at the place of the first encampment of General Stark. The final day was occupied with the dedication of a marker on the site of Col. Seth Warner's home and the dedication of historical markers on the battle field at Walloomsac, N. Y., including a bronze relief map of the area of the battle field showing the movements of the troops during the contest. These memorials were presented by the State of Vermont and accepted by the State of New York represented by Governor Smith.

A military parade was the final event of the celebration. The United States government authorized the issue of 40,000 memorial half dollars. These were designed by Charles Keck of New York. On the obverse of these coins was the profile of Ira Allen under the legend: "He Founded Vermont, the 14th State." A monumental shaft was reproduced on the reverse which bore also the legend: Battle of Bennington. A commemorative two cent postage stamp was issued by the Post Office department in honor of the event.

August 24. The 257th anniversary of the discovery of the Shenandoah valley was celebrated in Linden, Va., by beginning work on the Shenandoah Park highway from Front Royal toward Washington as the first link of a proposed John Marshall coast to coast highway, with appropriate exercises, including an address by John Barton Payne. It was also the 257th anniversary of the exploratory trip of John Lederer, a Franciscan monk, to whom a granite marker was erected near the spot where he first saw the Shenandoah valley. The exercises were under the auspices of the Shenandoah National Park Highway Association.

August 26. A memorial celebration of the 151st anniversary of the battle of Long Island was held in Prospect Park, Brooklyn, N. Y., under the auspices of the Kings County Historical Society. Delegations from the American Legion, the Veterans of Foreign Wars, and other patriotic organizations participated in the ceremonies. The celebration was held on the spot where 800 Americans under Major-General Sullivan successfully held in check 6000 Hessian troops until reinforcements under Cornwallis threatened the American flank and forced them to withdraw.

September 9-11. The sesqui-centennial celebration of the battle of the Brandywine was participated in by representatives of the States of Delaware and Pennsylvania and from Great Britain and France. A tour of the battlefields was made on the 9th and wreaths were placed upon the graves of the soldiers who fell in this battle. One of immortelles was placed to the memory of the British and American soldiers by Col. R. Pope-Hennessy, military attaché of the British embassy at Washington; Maj. Georges Thenault, aviation attaché of the French embassy, placed a wreath of laurel in tribute to the American soldiers; Governor Fisher of Pennsylvania placed a similar wreath to the memory of General Lafayette who was wounded in the battle, and Maj.-Gen. William C. Price of the Pennsylvania National Guard dedicated a wreath to the British soldiery. During these events "The Star Spangled Banner," "God Save the King," and the "Marseillaise" were played. Other exercises included a historical pageant and various military maneuvers.

September 10. The 150th anniversary of the founding of the government of the State of New York was celebrated in Kingston, N. Y. The events included a pilgrimage to historic buildings and sites with the placing of a wreath on the tomb of Governor George Clinton; the dedication of the new Kingston State Museum; addresses by Governor Smith, former Senator Wadsworth, and others; and a historical drama depicting: The adoption of the first State Constitution, the inauguration of Governor George Clinton, the first meeting of the State Supreme

Court, and the organization of the first State Legislature. A medal commemorating the event was struck.

September 11. The opening in Chicago, Ill., and formally naming a new boulevard "Leif Erickson Drive" which sweeps broadly for 11½ miles along the shore of Lake Michigan south from the centre of the city was celebrated under the auspices of the Norwegian National League on this date. A Viking ship with brilliant sail pushed its way to the outer edge of the new boulevard, and from this ship stepped Gerhard Folgero, dressed as Leif Erickson was when he set foot upon the American continent in the year 996. The 42-foot boat was an exact half-size replica of the Viking's ship, in which Folgero and four men made the long voyage across the Atlantic, landing at Boston Aug. 12, 1926, after 6700 miles of buffeting and hardships. Erickson was on a missionary voyage to a small community in Greenland when he discovered the American continent, historians of his race say. He named the country "Vinland," and he and his crew remained there four years, from 996 to 1000.

September 17. Under the auspices of the National Security League which believes that an understanding of the fundamental principles of the Constitution of the United States is the only antidote for radical and Socialist propaganda, the governors of the states of Arkansas, Delaware, Maine, Maryland, Mississippi, Nebraska, Nevada, New York, North Dakota, Rhode Island, Texas, and Utah officially proclaimed the observance of Constitution Day. Clergymen were asked to preach sermons on the Constitution and State Superintendents of Education in Kentucky, New Mexico, Ohio, Oregon, Rhode Island, South Dakota, Texas, and West Virginia, in accordance with the suggestion of the League, issued special orders to their teachers to prepare suitable programmes. League speakers were heard in various parts of the country on Constitution Day. In New York City, the statues of Washington and Franklin, and the tomb of Alexander Hamilton were decorated with wreaths, and appropriate addresses were delivered. The slogan for Constitution Week was "Cherish the Constitution lest we perish."

October 1-4. The 150th anniversary of the battle of Germantown, Pa., was celebrated with interesting ceremonies, among which was the placing of ten markers on various sites to indicate places where important events occurred during the battle. Also a bronze tablet to the memory of Gen. Francis Nash of North Carolina was dedicated with appropriate exercises by representatives from the Old North State at the place where General Nash was buried after the battle near the American encampment.

October 6, 7, and 8. The 150th anniversary of the battles of Saratoga, culminating in the surrender of General Burgoyne, was elaborately celebrated. The preparation included the restoration, under the supervision of the Advisory Board on Battlefield and Historic Sites, of the battle fields as nearly as possible to the condition in which they were at the time of the battles, including the rebuilding of Fort Neilson. All of the points of interest on the battle fields were designated with descriptive markers so that the progress of the battles could be studied on the field. The first day's events were held in Glens Falls, N. Y., under the auspices of the

New York State Historical Association at which papers were read, notably one on Burgoyne by Prof. D. R. Fox, who described the British general as "the man upon whose military ruin was built the United States." Other events were a sham battle presenting the great contest of 150 years ago and culminated in a pageant of Saratoga portraying events of the period. Five hundred dancers interpreted by dramatic, lyric, and pantomime art phases of history included in the pageant. Josephine Wilhelm Wickser of Buffalo was the author of the pageant which was composed of the episodes, "A New Soil in the Making," "A New Mind in the Making," "A New Spirit in the Making," "A New Flag in the Making," "A New Nation in the Making," "A New Soul in the Making." Various monuments were dedicated with appropriate addresses, and finally part of the battle field itself was made a public park and officially transferred to the custody of the State of New York. Representatives of 48 states and of the allied nations and the enemy nation of the Colonies in the War of the Revolution were present, and it was estimated that more than 100,000 spectators participated in the celebration.

The U. S. government authorized a two cent commemorative postage stamp on which was depicted a reproduction of Trumbull's famous painting of Burgoyne's surrender, now in the Capitol, and it bore the words "Ft. Stanwix, Oriskany, Bennington, and Saratoga." Congress is to be asked to appropriate more than \$1,000,000 for the creation of two national memorials on the Saratoga battle fields. The State Legislature was to be asked to authorize the purchase of the remaining 2,000 acres of the battle field and also of additional land at the battle fields at Walloomsac, where the Battle of Bennington was fought, and at Oriskany. The Mayor of Mechanicsville announced a movement to establish a museum in the great tower visible from Massachusetts and Vermont, containing memorials to the thirteen original States, assembly rooms for patriotic societies, and cyclorama paintings of the events of the Revolution which took place in that vicinity.

October 8-15. Burlington, N. J., celebrated the 250th anniversary of its founding with a week of festivities. The programme began on October 8 with the unveiling of a tablet to mark the street-corner meeting place of the Council of Proprietors of New Jersey since 1688 which preceded the gathering in the meeting house. The Council, New Jersey's oldest realty corporation, received its charter and land grants from the English throne. Its meetings, held for years under a tree at the corner, were later continued in front of the site of a bank, on the walls of which the tablet was erected. Other events were special religious exercises, a community service, a historical pageant, and on military day which was the ninth anniversary of the 114th Infantry's participation in the Battle of Blois Dormont, in the Argonne, the entire regiment paraded under command of Colonel Edward B. Stone, who was promoted from Captain to Major on the field of battle. As a feature of the celebration the new State National Guard armory was dedicated and turned over to Company K of the 114th as its permanent home.

October 12. The 60th anniversary of the meeting in 1867 of 15,000 Indians, representing the Kiowa, Cheyenne, Arapahoe, Comanche, and

Plains Apache Tribes, with a commission authorized by Congress and appointed by the President when what is now known as the Medicine Lodge Treaty was signed. Under it the Indians agreed to end the frontier warfare and to stay within reservation boundaries. This event was celebrated in Medicine Lodge, Kan., with a pageant written and directed by Prof. F. L. Gilson of the Kansas State Teachers' College, Emporia. It depicted the arrival of Coronado, the planting of the cross and the Spanish flag, the Lewis and Clark expedition, the coming of early settlers, an Indian attack and the signing of the peace treaty. Members of the original five tribes, white descendants of pioneer settlers, and Government and State officials participated in the ceremonies.

October 12. The 150th anniversary of the battles of Forts Clinton and Montgomery in the War of the Revolution was celebrated at Newburgh, N. Y. It included a pageant, a parade, and fireworks. The literary and other exercises were held in Washington's Headquarters and addresses were made by Senator R. S. Copeland, Congressman Hamilton Fish, and others. It formed the lower Hudson part of New York State's sesqui-centennial celebrations.

October 13-15. The 150th anniversary of the convening of the first Continental Congress was held in York, Pa. It was in the courthouse in York that Congress received the news of Burgoyne's surrender, passed the Articles of Confederation, issued the first national Thanksgiving proclamation, received the news from Franklin in Paris that France would send a fleet, money, and an army, and received Baron von Steuben and Lafayette and commissioned them as major-generals. It was in York also that Lafayette frustrated the plot to supplant Washington with Gates. During the celebration the mornings were devoted to gatherings at which historical events were described, the afternoons, to parades, both military and civil, and the evenings to the presentation of a pageant depicting the history of York. A joint committee officially representing Congress was appointed consisting of Senators Fess, Ohio; Caraway, Arkansas; Moses, New Hampshire; and Swanson, Virginia; and Representatives Ackerman, New Jersey; Crisp, Georgia; Tilson, Connecticut; and Moore, Virginia, to attend the celebration.

October 22. The 150th anniversary of the battle of Red Bank, N. J., was celebrated by a military and civic parade that followed the same route over which Count von Donop led 1200 trained Hessian troops against the Continental garrison of 450 troops defending Fort Mercer at Red Bank. The Continentals, commanded by Colonel Christopher Greene, loaded their cannon to the muzzles with grapeshot and did not fire until the enemy rushed the outer works of the fort and attempted to scale the inner embrasure. The Hessians lost nearly four hundred in dead and wounded. Among the fallen was Count von Donop. The civil exercises were participated in by the governors of New Jersey and Delaware and representatives from Rhode Island and Pennsylvania. The principal address was made by Governor Moore of New Jersey.

November 30. At Georgetown, S. C., representatives of the French government and of the United States joined with South Carolina and Georgetown in paying tribute to the memory of Lafayette, who came across the Atlantic 150

years ago to assist the American colonists in their war for freedom. Lafayette first landed on American soil at North Island in Georgetown Harbor, and the unveiling of a tablet there was to commemorate the event.

December 1. The 150th anniversary of the landing of Baron von Steuben at Portsmouth, N. H., was celebrated in New York City by a gathering held in Madison Square Garden at which addresses were made by Jacob Gould Schurman, American Ambassador to Germany, Secretary of War Dwight F. Davis, Major-Gen. William N. Haskell and Mayor Walker. Baron von Steuben brought to the struggling Colonies a wealth of military experience and ability which was of priceless value to the untrained forces of the Continental Army, in which army he became a Major-General and Inspector-General.

WASHINGTON BICENTENNIAL. The second official meeting of the United States Commission for the celebration of the 200th anniversary of the birth of George Washington was held in the White House on Jan. 13, 1927. At this meeting President Coolidge was invited to deliver an address before a joint meeting of Congress on Washington's birthday in the chamber of the House of Representatives. Accordingly on that date an impressive address was made by the President before a distinguished audience, including not only the members of Congress, but also the Supreme Court, members of the Washington family, the diplomatic corps, and other guests. Among the many proposals received by the Commission for their consideration the following are typical: The erection of permanent State buildings in or near the District of Columbia, designed by the authority of each State and territory, the Federal Government to contribute the land; the completion of the George Washington Memorial Building and Victory Memorial; the publication of the complete history of the founding of the city of Washington, and President Washington's part therein; a world's fair in the city of Washington, the buildings to be permanent, with a view to annual expositions; publication of (a) Washington's orders as commander in chief of the army during the War of the Revolution, (b) of a book of Washington as seen by his contemporaries, and (c) of a collection of Washington's letters; a comprehensive nation-wide, all-embracing national celebration, reaching its climax and revolving around the concept of Washington for a University of America, wherein to teach republican principles of government; and the building of a national memorial highway from the home of Washington to the city of Washington, D. C.

CELESTIAL MECHANICS. See **ASTRONOMY**.

CELTIC STUDIES. See **PHILOLOGY**, **MODERN CEMENT**. During 1927 the production and shipments of portland cement from the United States were considerably in excess of the totals for 1926. The preliminary figures in 1927, given in the accompanying table, indicate an increase of over 4 per cent in production and more than 5 per cent in shipments over 1926. During the year 1927 the various plants operated at 73.9 per cent of their capacity as compared with 76.2 per cent in 1926. This estimate is based on total output of finished cement as compared with the estimated capacity of 155 plants at the close of December, 1927, and of 141 plants at the close of December, 1926. The following table gives the

final estimates for 1927 by districts compared with the figures for 1926 for both production and shipments. In the year 1926 the exports of cement amounted to 974,226 barrels, valued at \$2,995,833. In 1926 the imports were 3,250,056 barrels, valued at \$5,128,836.

PRODUCTION AND SHIPMENTS OF FINISHED PORTLAND CEMENT IN 1927, BY DISTRICTS

[In thousands of barrels]		1927	1926
District			
PRODUCTION			
Eastern Pennsylvania, New Jersey, and Maryland		42,119	42,139
New York		10,750	8,796
Ohio, Western Pennsylvania, and West Virginia		17,811	15,914
Michigan		13,959	12,087

California		14,021	13,660
Oregon and Washington		8,607	8,118
Total		170,923	162,187

^a Began producing September and shipping October, 1927.

^b Began producing June and shipping July, 1927.

CENSUS, UNITED STATES. The Bureau of Census, W. M. Steuart, Director, was engaged during the fiscal year ended June 30, 1927, in preliminary work on the fifteenth decennial census of population to be taken in 1930. During the year the first census of distribution was undertaken, for the benefit of producers, merchants and ultimate consumers. The statistics show the number of different classes of stores, kinds of business, number and classes of persons engaged, salaries and wages paid, stocks on hand and net and gross annual sales, and include wholesalers, retailers, commission merchants, manufacturers' agents, brokers and other classes engaged in the distribution of commodities.

The biennial census of manufactures for 1925, completed before the end of 1927, gave data for 187,390 establishments engaged in the fabrication of materials, 4860 laundries, and 2406 dyeing and cleaning establishments, and covered approximately 250,000 statistical items. The Bureau issues a monthly *Survey of Current Business* covering most of the basic industrial and commercial movements, and including more than 1700 individual statistical series. This publication has resulted in an increased interest on the part of business men in information on market

analysis, establishment of sales quotas, commodity surveys, and credit facilities. Monthly reports on the cotton situation, showing amount of cotton consumed and on hand, number of spindles, and active spindle hours, furnish a valuable measure of activity in the industry. Among other monthly or quarterly reports are those on production of boots and shoes, clothing, leather, tobacco, and automobiles.

Progress was made on the campaign for satisfactory State laws governing the registration of vital statistics (q.v.), in an effort to bring all States into the registration area for which the Bureau compiles and publishes birth and death data. An annual census of institutions was inaugurated during the year, limited to Federal and State penal institutions, hospitals for the insane, and institutions for feeble-minded and epileptic, and steps were taken to standardize and improve current State and local statistics of crime and criminals in the United States.

With the failure in the Sixty-ninth Congress of the second deficiency appropriation bill, carrying an item of \$100,000 to enable the Bureau to make tabulations for the Department of Agriculture from the 1925 census, it was not possible to compile all the detailed data desired but the Bureau was able to publish reports for each State and each county of all the principal data collected for the census. Tabulations are still required to show value of farm buildings, expenditures for fertilizer, labor, and lumber, kinds of road, distance to market, tractors and radio receiving sets on farms, acreage and production of specific crops and specified classes of livestock; classification of taxes and of mortgage debt by size and value of farm.

Work was in progress on the census of religious denominations which is taken every ten years. This census covered the year 1926 and the facts were secured directly from the individual churches, congregations and other local organizations, of which there were about 225,000. At the end of the fiscal year 71 smaller denominations had made complete returns and 42 others were nearly complete. The reports included denominational history, doctrine, and statistics. The Bureau has been engaged in perfecting its machinery and electrical devices used to tabulate the detailed data and it reports equipment of 2283 machines of various kinds, most of which were in constant use during the fiscal year in punching 123,000,000 cards, of which 83,000,000 were for the Census Bureau.

CENSUS, WORLD AGRICULTURAL. See AGRICULTURE.

CENTRAL AMERICA. The term generally applied to the southern portion of the North American continent lying to the north of the Panama Canal and south of Mexico and consisting of the five states, Costa Rica, Guatemala, Honduras, Nicaragua, and Salvador. See the articles on these respective countries.

CEYLON, sə-lôn'. An island in the Indian Ocean off the southern extremity of Hindustan, belonging to Great Britain. Its extreme length from North to South, i.e. from Point Palmyra to Dondra Head, is 266 miles; its greatest width 140½ miles from Colombo on the west coast to Sangemankande on the east coast. Area, 25,332 square miles; population, at the census of 1921, 4,504,549, as compared with 4,106,350 in 1911; estimated at the end of 1925, 5,009,501. The registered movement of population in 1925

was as follows: Births, 193,262; deaths, 117,545; marriages, 31,331. The chief cities with their populations in 1921 were: Colombo, 244,163; Jaffna, 42,436; Galle, 39,073; and Kandy, 32,047. The number of vernacular schools in 1925 was: Government schools, 1121, attended by 118,061 boys and 53,296 girls; aided schools, 1751, attended by 124,378 boys and 80,270 girls; unaided schools, 1040, attended by 18,228 boys and 5000 girls; English and Anglo-vernacular schools, 344, attended by 47,831 boys and 14,250 girls.

Ceylon is almost entirely agricultural and specializes in export crops. Plantation tea, rubber, and coconuts make up the bulk of its products, but considerable amounts of cacao, cinnamon, citronella grass, and miscellaneous products are grown, largely by individual native farmers. Considerable rice is also raised, but more than half of the country's total consumption of this food supply is imported from India and other sources. Specializing in export crops as Ceylon does, its export record is an excellent gauge of its prosperity. The volume of exports in 1926 reached 483,588,500 rupees, compared with 385,517,000 for 1924 and 471,866,000 rupees for 1925. Tea was the ranking product of the island, but rubber was rapidly approaching it in value of output. During 1926 a total of 217,000,000 pounds of Ceylon tea, which was valued at 213,000,000 rupees, was exported, as against 209,800,000 pounds valued at 199,697,000 rupees in 1925. Black tea is produced almost exclusively. While the distribution of Ceylon tea is very wide the great bulk of it goes to English-speaking countries.

Exports of rubber from the island increased from 82,950,000 pounds in 1924 to 142,500,000 pounds in 1926, while the value increased from 69,000,000 rupees to 184,400,000 rupees. Coconuts and coconut products come third on Ceylon's production list and account for about one-sixth of the island's total exports. Imports into Ceylon during 1926 were valued at 407,867,000 rupees as compared with 360,380,000 for 1925. Nearly one-quarter of Ceylon's imports is made up of husked rice, obtained almost entirely from British India. Rice imports in 1926 amounted to 8,795,000 hundredweight as against 8,321,000 for 1924. Cotton piece goods, coal, fertilizers, refined sugar, crude petroleum, kerosene, automobiles, fish, and gasoline made up the bulk of the remainder of imports.

The chief mining interest is plumbago, 186 mines being in operation at the end of 1925 and the exports in that year being 309,000 hundredweight. Gold, thorium, and monazite exist to some extent but have scarcely justified exploitation on a commercial scale. Gem quarries abound throughout the island and among the precious stones found are moonstones, rubies, cat's-eyes, and sapphires. The native manufactures include weaving and the making of tortoise shell boxes, earthenware, lacquer work, jewelry, carving, etc. They are not of much commercial importance, however. The chief manufactures on a large scale pertain to agricultural products, including the extraction of coconut oil.

The revenue in 1924-25 was £7,702,645 and the expenditure £7,091,046. The shipping which entered and cleared in 1925 totaled 19,419,000 tons. At the end of December, 1925, there were 791 miles of railway open to traffic and exten-

sions were under construction. The administration as embodied in an Order in Council of December, 1923, is in the hands of a governor, aided by an executive council of nine members and a legislative council of 49 members (12 official and 37 unofficial). Of the unofficial members, 23 are elected to represent the territorial divisions, two to represent the Europeans, two the Burgher Community, one the Chamber of Commerce, one the Western Province Tamils; three the Mohammedans, and two the Indians. Governor at the beginning of 1927, Sir Hugh Charles Clifford; succeeded March 24, by Sir H. J. Stanley, Governor of Northern Rhodesia.

The Maldivé Archipelago, consisting of 13 coral islets, 400 miles west of Ceylon, is tributary to Ceylon. They are sparsely settled by a mixed race of probably pure Aryan stock and governed by a native Sultan. The islands are covered with coconut palms and yield millet, fruit, and coconut produce. The population numbered over 70,000 in 1921. The islanders are civilized.

CHAKSTE, JANIS. First president of Latvia, died at Riga, March 14. He was born in Courland, Sept. 14, 1859, and first attained prominence in political life in 1906, when he was elected a member of the first Russian Duma by the Government of Courland. Previously he had been a member of the bar at Mitau; after his legislative service he retired to that city, where he remained until 1915, when the town was invaded by the Germans. Moving to Petrograd, he founded a central relief committee to aid the Latvian refugees, who at that time numbered about 500,000. In 1916, leaving Russia, he went to Stockholm to begin propaganda for Latvian independence, and published there a book in German entitled *Die Letten und ihre Latvija (The Letts and Latvia)*. In 1918, when the independence of the Latvian Republic was proclaimed, he was elected chairman of the People's Council, and was assigned the task of securing recognition of the Latvian Republic by the Allies, being appointed chief of the special delegation sent to Paris and London. In 1920 he was elected President of the Latvian Constituent Assembly and became professor of international law at the University of Riga. He was unanimously elected President of the republic by the first parliament, Nov. 14, 1922, and was reelected, Nov. 6, 1925, for a term of three years.

CHAMBERLAIN, HOUSTON STEWART. German writer on music and literature, died at Bayreuth, Germany, in January. He was born Sept. 9, 1855, at Portsmouth, England, the son of a British admiral. His earliest education was received at Versailles, France, and later he attended Cheltenham College, Gloucester. At first he intended to follow a military career, but poor health compelled him to change his plans. In 1870 he left England and settled in Germany, at first in Stettin. Here Professor Kuntze aroused his interest in Germanic culture and civilization, the study of which occupied him for many years and resulted in his most important work, *Die Grundlagen des Neunzehnten Jahrhunderts*, published in 2 volumes (Munich, 1899, 1901; reprinted in many editions) and translated into English by Lord Redesdale (1910). In 1879-81 he studied natural sciences at Geneva, and also music. From 1885 to 1889 he lived in Dresden, contributing to various

prominent German, English and French periodicals, writing with equal facility in all three languages. From 1889 to 1908 he lived in Vienna. In the latter year he married Eva, the youngest daughter of Richard Wagner, and removed to Bayreuth. From the very beginning of his life there he was one of the most ardent and influential apostles of Wagner's art, and a man of deep penetration and keen, analytical insight. His great biography of the master, *Richard Wagner* (Munich, 1896; 2 vols.) is a profound psychological study rather than a mere record of events. *Das Drama Richard Wagners* (Leipzig, 1892) is still one of the best works on the subject. His other works are: *R. Wagners Echte Briefe an F. Prager* (1894), *Die Ersten 20 Jahre der Bayreuther Festspiele* (1896), *Parsifalmärchen* (1900); *Worte Christi* (1901), *Heinrich von Stein* (1903), *Immanuel Kant* (1905), *Goethe* (1912), *Lebenswege Meines Denkens* (1919), *Mensch und Gott* (1920), *Betrachtungen über Religion und Christentum* (1921). Consult L. von Schroeder, *Houston Stewart Chamberlain* (Munich, 1918) and Anna Chamberlain, *Meine Erinnerungen an Houston Stewart Chamberlain* (Munich, 1923).

CHAMBER MUSIC. See **MUSIC**.

CHAMBER OF COMMERCE, INTERNATIONAL. The fourth meeting of the International Chamber of Commerce opened its sessions on June 27 at Stockholm, Sweden, with 825 delegates representing 41 different countries in attendance. Sir Alan Anderson, who was the acting president, in his opening address referred to various obstacles in the ways of international commerce and urged the removal of trade barriers, which include not only tariffs, but also the adverse treatment of foreigners, obstructions to transportation, prohibition of exports and imports and instability of currency. This removal of trade barriers was a dominant topic of discussion at the sessions of the Chamber, as it was considered vital for Europe and also because a study of the subject formed the basis of a large part of the work of an international economic conference held in Geneva.

Among the speakers at Stockholm were Sir Arthur Salter, head of the Economic Section of the League of Nations, and other leaders of the various delegations, who urged that the conclusions of the economic conference at Geneva should be adopted, inasmuch as trade barriers were strangling the nations economically and that not only were millions of the population suffering, but that a reduced standard of living was general as a result of such restrictions. The trade barriers were defined in a report submitted as "those arbitrary national restraints on free movement of goods, capital and services which not only restrain trade and traders but limit the economical production and distribution of goods, capital and services to the detriment of the peoples affected by the restraint. In production there is a unit of maximum economy; in distribution there is a market of maximum economy. Any barrier which prevents the co-ordination of these two is a trade barrier in the sense used by the Chamber."

The Chamber of Commerce pledged itself to coöperate with the League of Nations in carrying out the conclusions of the economic conference at Geneva and urged the various governments to accept these conclusions and to take them up as had been done by Belgium,

Austria, Germany, Czechoslovakia, Holland, and Sweden. The Chamber endorsed the Geneva declaration that tariff walls and policies hampering trade should be reduced or removed and expressed its satisfaction that the League of Nations proposed to call a diplomatic conference to draft conventions giving equality of treatment to foreigners admitted to any country and defining the conditions under which trade could be carried on and foreigners be taxed. The abolition of passport visas was advocated, and the ratification of the navigable water ways and maritime port conventions effected at Barcelona and Geneva was urged, in order to remove transportation barriers. Various tariff reforms and simplification of administration were urged together with long-term treaties to prevent tariff fluctuations and various artificial and obnoxious restrictions, which were hindering the free interchange of commodities between nations. In addition to trade barriers the conference discussed a number of technical reports dealing with patents, motor taxes, international telephony, and uniform practice regarding bills of exchange; it recommended that efforts be continued to reduce double taxation on nationals residing abroad and that shipping documents should be simplified and made uniform. Action was also taken regarding the details of international commercial arbitration. Before the adjournment of the meeting, Alberto Pirelli, a rubber manufacturer of Milan and a member of the Dawes Committee and of the Italian debt funding committee to the United States was elected president of the International Chamber. The next meeting was to be held in 1929 at Amsterdam.

CHAMBER OF COMMERCE OF THE UNITED STATES. A federation of more than fifteen hundred American business organizations having its headquarters at Washington, D. C. It was organized in 1912 for the purpose of providing a central association to gather and to make known business opinion on economic questions of national importance. The President of the United States and other government officials aided in its establishment, and throughout its existence the Chamber has cooperated closely with the government.

The Chamber's membership is made up of both national trade associations and local chambers of commerce. Policies are established by this membership in annual meetings and through the Chamber's referendum system, an effective method of obtaining the views of all classes of business on subjects affecting business enterprise.

A comprehensive information service is maintained at Washington. This work is facilitated by the form of organization existing within headquarters, where departments representing the main divisions of business industry are conducted by competent staffs. These departments are as follows: Finance; transportation and communication; manufacture; domestic distribution; foreign commerce; natural resources; insurance; civic development, and agriculture. In addition, there are other service units, including a well-equipped research department. The Chamber publishes *The Nation's Business*, a magazine.

The Chamber, as one of its functions in the interest of business, gives particular attention to the relations between government and busi-

ness, offering business judgment on legislative proposals and holding itself ready at all times to advise the government regarding the needs of business and the possible effect of governmental measures applying to business. The current aims of the Chamber, as outlined by President Lewis E. Pierson, are as follows: Extensive tax revision; Federal flood control; restriction of government activities in ownership and operation of the merchant marine; scientific adjustment of postal rates; removal of legislative obstacles to voluntary railroad consolidation; reorganization of Federal executive departments and bureaus in the interest of economy and efficiency; opposition to a Federal department of education; return of alien property sequestered during the war subject to the settlement of war claims of American citizens; opposition to a government controlled monopolistic workmen's compensation fund; repeal of legislative restrictions standing in the way of a permanent parcel post convention with Cuba; ratification of the Turkish treaty; and legislation simplifying ocean bills of lading. These were only some of the national questions with which the Chamber was ready to deal at the end of 1927. It had already equipped itself to support the Federal Reserve System by a thorough study of the entire banking and currency system of the country. Other questions which received the Chamber's attention were immigration, agriculture, power development, commercial forestry, highway improvement, and the distribution census.

The affairs of the Chamber are directed by a board of 34 directors, each elected for a term of two years, representing the various geographical divisions of the country, as well as the main divisions of business. The officers are: President, Lewis E. Pierson, New York; Chairman of the Board, Judge Edwin B. Parker, Washington, D. C.; Vice Presidents: A. J. Brosseau, New York; William Butterworth, Moline, Ill.; Robert R. Ellis, Memphis, Tenn.; Paul Shoup, San Francisco, Calif.; Treasurer, John Joy Edson, Washington, D. C.; Secretary, D. A. Skinner, Washington, D. C.

CHARITIES. See CHILD LABOR; CHILD WELFARE; OLD AGE PENSIONS; RED CROSS; SOCIAL WORK; UNEMPLOYMENT; YOUNG MEN'S CHRISTIAN ASSOCIATION; YOUNG WOMEN'S CHRISTIAN ASSOCIATION, and the various articles on religious bodies and societies with charitable activities.

CHARLOTTE, PRINCESS. Former Empress of Mexico, died at Meysse, near Brussels, Belgium, January 19. She was the daughter of Leopold J. King of the Belgians, and was born at Laeken, Belgium, June 7, 1840, being baptized Marie Charlotte Amélie Augustine Victoire Clémentine Léopoldine. Her mother was Princess Louise of Orleans, the daughter of Louis Philippe, King of the French. When 16 years of age, on July 27, 1857, she was married to the Archduke Maximilian of Austria, a brother of the Emperor Francis Joseph. Maximilian was then chief of the Austrian navy, and later, as Governor of Milan, lived at the charming castle of Miramar, near Trieste. After the City of Mexico had been captured by the French, Maximilian was offered the throne by an assembly of nobles, and in May, 1864, he and his wife arrived at the capital. The empress figured prominently in the Mexican Empire, and in its collapse after its abandonment by Napoleon III. When her hus-

band had been deserted by the French Emperor and his position had been weakened by enormous debts, she persuaded him to retain the throne rather than abdicate, as he desired. In 1866, when but 26 years of age, she went to Paris and Rome to plead her husband's cause, but her mission was a failure, and it was feared that her mind would give way under the strain. After the capture of Maximilian and his execution, June 19, 1867, her mental breakdown was complete, and she retired to Miramar, and later to the Château de Bouchout, owned by her brother, Leopold II. She lived for more than fifty years at this chateau, maintaining the fiction that she was still Empress of Mexico and presiding over a small court. While she suffered from mental derangement she never was declared incompetent, and in many instances there were evidences that her reason was, at least in part, restored. During the World War, when the Germans marched through Belgium, the chateau of the ex-Empress was not molested, for an American flag floated over the gateway of the grounds, and later the Germans ordered the safety of the place on account of the Empress' relationship to Emperor Francis Joseph. She was visited from time to time by various royal personages, including King Albert and Queen Elizabeth of Belgium, she being the aunt of the king. After her death the Belgian court went into ten days of mourning.

CHAUTAUQUA INSTITUTION. An educational movement established in 1874 by Lewis Miller and Dr. John H. Vincent, both prominent in the Methodist Episcopal Church. The institution is non-sectarian in principle, although the original idea of the organization was a Sunday school for teachers where a series of correlated lectures and entertainments were presented during the months of June, July and August. The three general fields of activity are: The general assembly, consisting of an educational and popular series of lectures and addresses, concerts and dramatic entertainment, etc.; the summer schools, offering courses of formal classroom instruction; and a home reading circle in which a set of four books is designated for reading during the year, in addition to a news narrative appearing in a monthly review. In 1927 there were 19 departments in the summer school, with 125 instructors and 2500 students, while the attendance at the annual session was estimated at 45,000. Financial support is obtained largely through individual gifts. Permanent buildings, valued at \$1,250,000, are owned by the Institution at Chautauqua, N. Y., where the general summer assemblies are held and the Chautauqua Press is located. Officers: George E. Vincent, honorary president; Arthur E. Bestor, president; William L. Ransom, chairman of trustees; Shailer Mathews, chairman of the executive board; Charles E. Pierce, secretary; and Jessie M. Leslie, treasurer.

CHEESE. See **DAIRYING**.

CHEMICAL INDUSTRY, SOCIETY OF. See **CHEMISTRY, INDUSTRIAL**.

CHEMICAL SOCIETY, AMERICAN. See **CHEMISTRY, INDUSTRIAL**.

CHEMICAL TRUST. See **CHEMISTRY, INDUSTRIAL**.

CHEMICAL WAR SERVICE. See **MILITARY PROGRESS**.

CHEMISTRY. The advances made in this branch of science during the year were steady

and persistent, as is perhaps best shown by the increasing publication of both the results of investigations and of treatises on chemistry. Also the pursuit of chemistry was more than ever becoming a recognized profession and a greater number of young men and women were preparing themselves for it as a life work, at the leading educational institutions.

NEW ELEMENTS. The discovery of no new element was announced during the year. Nevertheless there was some controversy concerning the discovery of the element No. 61. In the *YEAR BOOK* for 1926 (p. 149) there was given an account of the discovery of this element by Prof. B. S. Hopkins of the University of Illinois, who conferred upon it the name *illinium* in honor of the university with which he was connected. At the close of the paragraph mention was made of the claim by Prof. Luigi Rolla for its discovery in virtue of a sealed communication deposited with the Reale Accademia dei Lincei on June 21, 1925. This communication was published (*Atti R. Accad. Lincei*, vol. 4, 1926, p. 515) and in it was made the claim that an absorption band was observed in the spectral region between samarium and neodymium, which has a wave length agreeing closely with that calculated for the previously unknown element of atomic number 61. For this element the name *florentium* was proposed. B. S. Hopkins presented a summary of the American researches (*Journ. Franklin Inst.*, vol. 204, p. 1) that led to the discovery of the element 61.

ATOMIC WEIGHTS. The determination of these important constants continued to occupy the attention of a number of chemists, notably in the United States at the laboratories at Harvard University under the direction of Prof. T. W. Richards and in Europe by O. Hönigschmid and his associates in Berlin.

Among the results announced are the following: According to G. P. Baxter and A. Q. Butler (*Journ. Amer. Chem. Soc.*, vol. 48, p. 3113) the atomic weight of titanium, namely 47.90 (Cl 35.458) is confirmed by the use of more refined analytical methods. According to E. Moles (*Berichte*, vol. 60, p. 134) the atomic weight of argon ± 39.88 , as adopted by the German Commission in 1923, is based on the weight of the liter of crude argon, and is certainly low. The most probable weight of the liter of pure gas is 1.7833 ± 0.0001 gram, from which the atomic weight of argon is deduced as 39.94 which the author regards as a minimal value. N. H. Smith reports (*Journ. Amer. Chem. Soc.*, vol. 49, p. 1642) that the mean of nine analyses of scandium chloride gave 45.160 as the atomic weight of that element. He prepared his anhydrous scandium chloride by passing carbon tetrachloride vapor diluted with nitrogen over pure scandium oxide at 750–800°. K. K. Krishnaswami (*Journ. London Chem. Soc.*, 1927, p. 2534) made determinations of the atomic weight of antimony from five samples of which four were from India and Burma, using Willard's and McAlpin's method. His results ranged from 121.744 to 121.754, which were in good agreement with previous determinations and also agree within the limitation of experimental error. According to O. Hönigschmid and A. von Welsbach (*Zeit. Anorg. Chem.*, vol. 165, p. 284) who examined yttrium chloride containing no spectroscopically detectable quantity of other rare elements, they found the probable value of

the atomic weight of yttrium as 88.925 ± 0.002 . These same authorities examined dysprosium sulphate containing only about 0.1 per cent of holmium and determined the atomic weight of dysprosium as 162.46.

ANALYTICAL CHEMISTRY. A knowledge of the constituents of a compound are of value in determining its properties. Analysis is essential for synthesis, and so an important branch of chemistry is the study of the methods of analyzing substances. Some of the recent improvements are here recorded as well as improved forms of apparatus.

A reagent prepared by mixing a solution of potassium carbonate, hydrogen carbonate, and thiocyanate is recommended by L. Fabian (*Biochem. Zeit.*, vol. 179, p. 59) for the colorimetric determination of sugar. This new reagent is mixed with one of copper sulphate and heated with the sugar-containing solution. The reduction in intensity of color as compared with that of the original reagent gives the amount of sugar. For this new determination of sugar, the author claims that within physiological limits of blood-sugar concentration, the error of the method is ± 5 per cent. K. O. Schmitt in studying precise volumetric analysis discusses (*Zeit. Anal. Chem.*, Vol. 70, p. 230) the use of weighing burettes and weighing tubes for measuring the reacting substances and of colorimetric methods for determining the exact end-point of a titration, and also the magnitude and means of correcting errors introduced by weighing in air. According to F. W. Ashton (*Nature*, vol. 119, p. 489) mercury obtained from coal tar when it is present in the highest fraction, gives isotopic lines indistinguishable from those of ordinary mercury.

A. Müller describes a new form of pipette (*Zeit. Angew. Chem.*, vol. 40, p. 18) as follows: At the upper end of the pipette is a bulb closed by a ground glass stopper connected to a cock, a right-angle bend, and an expansion filled with a suitable absorbent. One such attachment serves for a series of pipettes. It has been found by A. Bernardi (*Gazzeita*, vol. 57, p. 232) that when dilute solutions of cobalt salts are treated in the cold with sodium hydroxide in the presence of air, the blue basic salt at first formed rapidly changes to a green stable compound. Among new forms of apparatus may be mentioned a new nitrometer which according to A. Klemenc and E. Hayek (*Zeit. Anorg. Chem.* vol. 105, p. 157) may be used for determining the quantity of nitrogen present in very dilute solutions of nitric and nitrous acids.

BIOCHEMISTRY. The chemical value of medicinal preparations, their reactions with the human systems, and their general relations to life are among the elements that form this interesting branch of chemistry, some of the advances of which are indicated in the paragraphs that follow.

A study of the biochemistry of tooth growth (*Journ. Biol. Chem.*, vol. 71, p. 437) made by Y. Matsuda shows that during growth the ash content of the incisor teeth of rats increases, while the water content decreases, and the content of organic matter shows no marked change. The alterations are continuous in character except for a break which occurs at puberty. The calcium and phosphorus content of the ash does not alter with age, but the magnesium tends to increase. Minor differences are observed between

the upper and lower incisors. The action of insulin on normal animals according to E. Grafe, H. Reinwein, and H. Singer (*Arch. Exp. Path. Pharm.*, vol. 119, p. 91) shows that when fragments of liver are taken from an animal after injection of insulin and suspended in Ringer solution, less glycogenolysis is observed than is the case with fragments from the same animal before the injection of insulin. The determination of pepsin in gastric juice according to H. Citron (*Deut. Med. Woch.*, vol. 52, p. 1781) may be accomplished satisfactorily when the pepsin is allowed to act on fibrin, dyed with carmine, and the resulting color compared with that obtained from a standard preparation of known composition. According to A. B. Ilievitz (*Journ. Biol. Chem.*, vol. 71, p. 693) the urine from a case of diabetes insipidus on long keeping under sterile conditions in the cold, yielded an ether soluble purple pigment of unknown composition, that was soluble in alkalis, insoluble in acids, showed no characteristic absorption spectrum, and could not be related to indican.

The body temperature and the metabolic rate of the rat according to F. M. Walters (*Amer. Journ. Physiol.*, vol. 80, p. 140) were depressed by breathing carbon monoxide to a degree varying with the carbon monoxide saturation of the blood. His conclusion is therefore that there is a relation between the fall in metabolic rate and the symptoms of poisoning. E. C. Kendall, who had been working on the isolation of thyroxin, reported (*Journ. Biol. Chem.*, vol. 72, p. 213) that he had been unable successfully to apply the method of Harington for the isolation of this important substance from the thyroid gland. He also found the distribution of thyroxin among the various fractions obtained in the process of isolation to be different from that described by Harington. He therefore suggests that the process of isolation may have to be varied according to the place of origin of the thyroid glands employed. The action of tellurium in the treatment of human syphilis has been studied by L. Fournier, C. Levadite, and L. Guenst, who report that when tellurium is administered either as tellurium trioxide, tellurium iodide, quinine tellurium iodide, or as the element in a finely divided condition, it has a marked curative action on human syphilis, but the treatment is complicated by the occurrence of undesirable reactions in certain cases. According to A. Siegler (*Compt. rend.*, vol. 184, p. 954) both normal and syphilitic human sera give a positive Bordet-Wassermann reaction after ultrafiltration through collodion mounted on a nickel filter sheath, the nickel apparently acting as a catalyst. This change in serum in presence of nickel does not take place in a vacuum.

The toxic principle of *Illicium religiosum* has been isolated by T. Q. Chou who describes it (*Chinese Journ. Physiol.*, vol. 1, p. 213) as a white amorphous substance of indefinite melting point. It contains no nitrogen, is soluble in cold water, and is feebly acidic. The substance has been given the name of sikimotoxin and is quite distinct from Eijkman's sikimin. It was found that 0.2 mg. to the gram body-weight is the minimum lethal dose for a cat. R. O. Herzog and W. Jancke found (*Zeit. Physiol. Chem.*, vol. 164, p. 308) that an X-ray diagram for the threads of the Madagascar spider very closely approximates to that of true silk. Hence

the two fibres contain the same crystalline constituents. The presence of kersin is reported in normal ox-spleen by E. Walz (*Zeit. Physiol. Chem.*, vol. 166, p. 210) and with it he finds a substance that gives a violet-red coloration with orcinol and hydrochloric acid in presence of ferric chloride, contains phosphorus, 22.4 per cent galactose, and agrees in its properties with a substance separated by Thierfelder from brain.

A study on the chemical activity of the spleen by G. B. Ray and B. B. Stimson (*Amer. Journ. Physiol.*, vol. 81, p. 62) shows that small doses of nitrobenzene caused the appearance of methemoglobin in the blood of dogs. By comparative studies on mammal and splenectomized dogs these authors concluded that the spleen plays some part in hindering the formation and hastening the removal of methemoglobin, probably by an active reducing action.

According to an interesting study on the distribution of potassium and sodium in plants by G. Andre and E. Demousey (*Compt. rend.*, vol. 184, p. 1501) the ratio of potassium to sodium shows a preponderance of the former in the older wood of ligneous plants and in the interior of tap roots during the period of growth, but an almost equal distribution during the resting period. This paper gives figures for the distribution of the elements mentioned in beet, in chestnut and in *Tamarix gallica*. R. E. Remington found (*Journ. Amer. Chem. Soc.*, vol. 49, p. 1410) that samples of American tobacco when examined by a micro-Marsh method, contained 0.05 to 0.27 grains of arsenious oxide to the pound. It is accepted that half the arsenic in pipe tobacco goes off in the smoke and half of that in plug tobacco is soluble in water.

Sympathol, which is a new adrenaline-like substance, has been studied by F. Lasch (*Arch. Exp. Path. Pharm.*, vol. 124, p. 231). He finds it to be a methyl- α -hydroxy-parahydroxy-phenylethylamine hydrochloride with a melting point of 154°. Its pharmacological properties resemble those of adrenaline but there are important quantitative and qualitative differences. According to M. Dye, O. C. Medlock and J. W. Crist (*Journ. Biol. Chem.*, vol. 74, p. 95) the vitamin A content of the leaves of lettuces of various modes of cultivation was approximately proportional to their chlorophyll content. A. Sordelli gave a detailed account (*Anal. Assoc. Quim. Argentina*, vol. 15, p. 57) of his study of the preparation of insulin from the pancreas of sheep. It was reported by M. Dorle and W. Liehr (*Biochem. Zeit.*, vol. 187, p. 385) that they do not find any relationship between blood-sugar, blood cholesterol, and blood pressure in cases of arteriosclerosis and hypertonia.

GENERAL CHEMISTRY. Under this heading are grouped the results of various recent studies of chemical elements and their compounds other than those of carbon, as well as their reactions to physical phenomena. These show a continued interest in this branch of chemistry.

The absorption spectrum of nickel was studied by K. Magrúdar (*Zeit. Physik*, vol. 32, p. 562), who obtained the spectra from an under water spark and from the vapor in a carbon tube furnace. He tabulated and grouped the absorption lines and gave a diagram of energy levels. A Japanese chemist, who had been studying overvoltage, reported (*Journ. Fac. Sci. Tokyo*, vol. 1, p. 223) that the overvoltage of hydrogen at electrodes of platinum, gold, copper, or

nickel depends to a considerable extent on the previous treatment of the electrode. After anodic polarization the value is a minimum, which is characteristic of the metal employed; with rise of temperature this minimum decreases in a linear manner. Much excellent work has been done during the year on the physical properties of the rarer elements. I. S. Bowen and R. A. Millikan report (*Physical Rev.*, vol. 28, p. 923) that the hot spark spectra of Y iii and Zr iv have been identified and term values tabulated. In yttrium and zirconium the normal position of the electron is in a 4d orbit rather than in a 5s orbit. E. Murmann (*Oesterr. Chem. Ztg.*, vol. 29, p. 226) reported that in the course of an unsuccessful search for a sixth alkali metal, the cesium line 3861.5 was detected in cigar ash, North Sea water, commercial magnesium chloride, rubidium alum, hay ash, and fungi, but not in cesium alum, potash from beet molasses, and the mother liquors from oxalic acid and lithium salt preparations.

The possible cause of the changes in vapors is discussed by Mrs. F. Langworthy who found (*Chem. News*, vol. 134, p. 20) that when illuminated by a spark the vapor of mercuric chloride appears green, that of mercuric bromide blue, and that of iodide, violet. This she accounts for on the supposition that, as the halogen atom becomes more positive with increasing atomic weight, the violet or more negative rays are more likely to be attracted to its vicinity. Elements in the same group of the periodic table become more positive with increasing atomic weight, and she reaches the conclusion that this increase of positivity is acquired in stages. An interesting discussion on the missing element 87 by G. von Hevesy was published in Denmark in which the author claimed that as only radioactive isotopes of the elements following number 86 (radon) are known, it was improbable that inactive isotopes of the missing element could be discovered. Since this element had an odd atomic number, it was expected that it can be found only as a comparatively short-lived body. Attempts were made to discover by the scintillation method an α -particle from mesothorium-2; the emission of an α -particle by this element (89) would lead to the formation of ilium-87. It was found that, if such a disintegration occurs at all, fewer than 1-200,000 atoms of mesothorium-2 can disintegrate in this way. Trials to find 87 as a β -product of radon, by removing all the known members of the active deposit of 100 millicuries, failed. The author suggested, however, that it might be possible to find an inactive isotope of polonium, and also discussed the possible formation of the element 85. An important study of the separation of metals from the gas phase was made by A. E. Van Arkel who reported (*Chem. Weekblad.*, vol. 24, p. 90) that metals of high melting power of which easily dissociated volatile compounds are known could be obtained in a pure coherent form by heating a filament of the metal in an atmosphere of the compound. The best results are obtained if the compound be prepared in the evacuated apparatus in which the metal is to be deposited: for this purpose an excess of the impure metal is included with the other element of the compound to be employed, which thus acts merely as a carrier to convey the metal from the impure powder to the pure deposit. Titanium,

zirconium, hafnium, thorium, molybdenum, tungsten, iron, and nickel are readily purified in this way. By suitable modifications nitrides, carbides, and alloys may also be prepared.

The distinguished Belgian chemist G. Urbain published (*Bull. Soc. Chem. Belg.*, vol. 36, p. 126) a summary of the discoveries which in 1923 led the International Commission to define an element in terms of an atomic number. A study of the density of water vapor by T. Shirai (*Bull. Chem. Soc. Japan*, vol. 2, p. 37) gives a description of his experiments as follows: A sealed bulb containing a weight quantity of water was broken by electrical heating, thus releasing its contents into the enlarged top of a barometer tube, on which the pressure was read. The molecular weight of water so obtained never deviated by more than 0.3 per cent from the theoretical value for unassociated water molecules, over the range 80–140°. An interesting account of the repetition of the work of Noddack, Tacke and Berg (*Berichte*, vol. 60, p. 621) on the occurrence of the manganese homologues of atomic numbers 43, 61, and 75, failed to yield any evidence of the elements 43 and 75 in columbite. The presence of ekamanganese in platinum ores could not be regarded as established. They found no evidence of the existence of element 61, and its presence in cerite they regarded as impossible.

An Italian chemist, O. M. Corbino, finds (*Atti R. Accad. Lincei*, vol. 5, 377) that when copper sulphate solution is electrolyzed using a copper anode immersed in the solution, and an aluminum cathode suspended above the solution in an atmosphere due only to the vapor pressure of the solution, finely divided copper appears in the solution as a suspension. The size of particles increases with the currents. Similar results were obtained with solutions of silver nitrate and gold chloride.

Experiments on the polishing of surfaces were described by J. W. French (*Nature*, vol. 119, p. 527) that show (a) when once a group of molecules has been torn from the embrace of its associates, it is practically impossible under forcing conditions to force it back within the region of molecular cohesion, and (b) that no considerable rise of temperature occurs such as would be anticipated if the "hill-tops" become fused. According to Lord Rayleigh who had been making a study of the bands in the absorption spectrum of mercury (*Nature*, vol. 119, p. 778), bands allied to, but not identical with, the emission bands previously observed from 3055 to 2697 Å. have been obtained in absorption. Closer examination of the diffuse absorption bands as 2345, 2338, 2334, and 2339 Å. shows that superposed on this structure is a much finer one of the order of 1 Å. The lines 2270 and 2656 Å. were not detected in absorption.

A study of the crystalline structure of iodine by A. Ferrari (*Atti R. Accad. Lincei*, vol. 5, p. 582) by means of the X-ray shows that this element has a structure consisting of a rhombic lattice with an elementary cell composed of an orthorhombic parallelepiped containing 8 atoms; a 4.760, b 7.164, c 9.783 Å. From an examination of the yellowish-red band spectrum excited in sodium vapor by the passage of a continuous current, H. Schüller concluded (*Zeitschr. Physik*, vol. 43, p. 474) that the spectrum consists of the resonance series of Na, which is excited by the sodium D light and of a Na-series similar to

the Lyman-Wittmer II₂ series. G. Renso, who examined a number of organic and inorganic compounds in order to investigate Karl's theory that the origin of triboluminescence is in the impurities of the substances which exhibit this phenomenon, reported (*Gazzetta*, vol. 57, p. 278) that while the results were not entirely conclusive still he believed that triboluminescence occurs in pure substances as he found that potassium bromide when repeatedly recrystallized was characterized by a strong luminescence, which was diminished by the addition of the impurities found in the mother-liquors.

The origin of the auroral green line in the oxygen spectrum has long been the subject of curious investigation. J. C. McLennare, R. Ruedy, and J. H. McLeod adduced parallel evidence (*Trans. Roy. Soc. Canada*, vol. 21, p. 27) to show that in seeking to fit the auroral green line 5577.341 Å. observed in the oxygen spectrum into the system of energy levels provided for oxygen atoms "forbidden" as well as "permissible" transitions should receive consideration. According to D. Balarev (*Zeit. anorg. Chem.*, vol. 165, p. 192) the simultaneous precipitation of zinc sulphide with copper sulphide from a fairly strong acid solution by hydrogen sulphide is not due, as has been previously suggested, to the formation of complex zinc sulphide but is a purely capillary effect. It was found by E. R. Washburn (*Journ. Physiol. Chem.*, vol. 31, p. 1246) that creeping occurred only when the solution wet the surface with which it is in contact. Capillary layers between the crystals themselves or more generally between the crust of crystals first formed and the walls of the vessel are responsible for the climbing of solutions, which is prevented by the presence of grease, oil, or paraffin over the surface.

MINERALOGICAL CHEMISTRY. The application of chemistry to geology naturally comes under this heading, and geological surveys always have a chemist on their staffs. The composition of minerals, of rocks, and of building materials is among the subjects that receive the attention of one who is a specialist in this branch of knowledge.

R. W. Lawson in *Nature* (vol. 119, p. 277) found himself unable to agree with Evans' view that an appreciable proportion of the energy liberated by the radio-elements, where they occur as rock constituents, is absorbed in ways other than raising the temperature of the rocks and gives his reasons why this theory should not be accepted. An interesting paper on the chemical formulas of mineral compounds has been published by L. W. Tibbyrica (*Nature*, vol. 119, p. 815) in which he points out as the only exceptions to the rule that the chemical formulas of all true mineral species composed of any of the first 21 elements should conform to the equation $M = 2a + 8n$, where M is the molecular number (sum of the atomic numbers) a the number of atoms, excluding hydrogen, n any integer, are the organic minerals, whewellite, oxammite, mellite, and fichtellite.

E. Moles (*Anal. Fis. Quim.*, vol. 24, p. 560) has calculated the percentage of argon by weight in the air from the values for the liter weight of crude atmospheric nitrogen and chemically prepared nitrogen, respectively, using the mixture rule. For the atmosphere at sea level, the percentage of argon is 0.909 or 0.946 if the maximum density of nitrogen is assumed in

the calculation. Two new yellow, greenish-yellow, or brownish-yellow minerals of the mosandrite group have been examined by E. M. Bonstedt, K. A. Nenadkevitch, and I. D. Starynkevitch-Bornemann (*Bull. Acad. Sci. Leningrad*, vol. 6, p. 118) for which the names rinkelite and lovtcharvite are proposed. Both minerals have a hardness of about 5 and they melt readily in the blowpipe flame and are easily dissolved by acids. A new mineral found in a silver-tin vein in the Animas mine in Chocaya, Bolivia, an analysis of which shows the formula $\text{Ag}(\text{Sb}, \text{Bi})\text{S}_2$, was announced by L. J. Spencer (*Min. Mag.*, vol. 21, p. 156) for which he proposes the name aramayoite. This author (*Min. Mag.*, vol. 21, p. 149) also announced a crystalline mineral from Tsumeb, Southwest Africa, to which he gave the name schultenite and which on analysis yields the formula PbHAsO_4 . W. Fuchs and G. Landsmann reported (*Berichte*, vol. 60, p. 246) the discovery of a new organic mineral from Mühren, Germany, which has a hardness of 1.5-2, a specific gravity of 1.1, a saponification value of 42.5, iodine value of 32.2, and is a polymerized resin to which they gave the name of walchowite. A bluish black massive mineral with a metallic lustre and a hardness of 3, was found in Colorado by W. P. Crawford to which he gave the name weissite. It has a composition corresponding to the formula Cu_5Fe_3 . J. B. Schriveron and J. C. Shenton reported a new mineral that consists of honey yellow orthorhombic crystals and has the molecular formula of $(\text{ThO}_2, \text{Ce}_2\text{O}_3, \text{ZrO}_2) \cdot \text{H}_2\text{O} \cdot 2\text{WO}_3 \cdot \text{H}_2\text{O}$ to which they give the name thorotungstite. It came from the Kramat Pulai Mine in the Federated Malay States.

ORGANIC CHEMISTRY. The chemistry of the carbon compounds continued to be the object of extensive investigations as shown by the great output of the results of researches made in European laboratories. Something of the progress in this branch of chemistry will be found in the following paragraphs.

Two new alkaloids were isolated from yohimba bark by P. Karrer and H. Salomon (*Helv. Chim. Acta*, vol. 9, p. 1059) ψ yohimbine $\text{C}_{11}\text{H}_{20}\text{O}_2\text{N}_2$, differing only from yohimbine in its crystalline form and its melting point of 264-265°. The second one was corynanthine $\text{C}_{19}\text{H}_{28}\text{O}_2\text{N}_2$ (OME), and was isolated as its hydrochloride with a melting point of 205°. In distinction from ψ yohimbine it is soluble in chloroform. I. M. Kothoff (*Pharm. Weekblad.*, vol. 63, p. 1453) found that small proportions of chlorine did not effect Deniges reaction for citric acid in aqueous solution. If however other organic acids are present, chlorides interfere strongly. The test can be carried out without removing chlorides if manganous sulphate be added. It was reported by O. Achmatowicz (*Rosc. Chem.*, vol. 6, p. 804) that bornyl acetate, prepared in presence of sulphuric acid or zinc chloride, yielded on hydrolysis a new alcohol, apparently a space isomeride of borneol, termed endoborneol, with a melting point of 186°, and a melting point of 203-204°, which on oxidation yielded camphor. Its ethyl ether with a boiling point of 83-87°, its phenylurethane, with a melting point of 138-139°, and its benzoate with a melting point of 186-187° were also described. For the rapid determination of opium in stomach contents, E. R. Dorey (*Analyst*, vol. 52, p. 26) recommended that the coloration produced by

adding hydrochloric acid, mercuric chloride solution, and ferric chloride solution to the filtered liquid be compared with that of a similarly treated standard solution of the kind of opium most likely to have been taken. It was found concerning the crystallization of sucrose, by I. A. Kukhareenko and M. E. Verkentin (*Zapiski* (Russia), vol. 3, p. 244) that at a supersaturation lower than the critical (which is 1.027, 1.031, and 1.030 for 0.5, 1.0, and 2.0 per cent of calcium chloride respectively) calcium chloride is a negative paralyzer, the speed of crystallization increasing with the concentration of calcium chloride in the mother liquor. At supersaturation above the critical point, calcium chloride is a positive paralyzer. An investigation of suggested types of linkings between amino acids based on a study of the stability or otherwise of collagen, gluten from gelatine, keratin, and peptone towards pepsin and trypsin was made by W. S. Sadikov. He found (*Biochem. Zeit.*, vol. 179, p. 326) that collagen was labile to pepsin, stable to trypsin; gluten was labile to both pepsin and trypsin; while peptone was stable to pepsin and labile to trypsin. He suggested that pepsin attacks ether, ester, or anhydride linkings, while trypsin acts on peptide linkings. In continuation of their studies on nitration P. S. Varma and C. K. Menon reported (*Journ. Indian Chem. Soc.*, vol. 3, p. 328) that in their work on the nitration of naphthalene, they found that the maximum yield (86 per cent) of a nitronaphthalene obtained by using a mixture of nitric and sulphuric acids was also produced when plaster of Paris, quicklime, or phosphoric acid is used as a dehydrating agent in place of sulphuric acid, although they are effective in the nitration of benzene. The boiling point curve for mixtures of naphthalene and a nitronaphthalene was plotted, and the percentage of the naphthalene in the product determined by this means.

A. Blanchetière reported (*Compt. rend.*, vol. 184, p. 405) that he found when commercial peptones formed by peptic and tryptic digestion of proteins were fractionated by formation of carbamates 14-33 per cent of the total nitrogen content of the peptones might be considered to be present as diketopiperazines. The formation of a new gallactopene is announced by F. Maunthner (*Journ. für Prakt. Chem.*, vol. 115, p. 137) who finds that when 3:4:5-trimethoxyacetophene is treated with aluminum chloride in chlorobenzene solution it yields 3:4:5-trihydroxyacetophene, which has a melting point of 187°-188°. N. Alders, who examined a series of samples of sericin prepared from raw silk by an improved method, found that they had an ash content of 3.9 per cent, gave the biuret, xanthoprotein and Miller reactions but not the Fehling test, that the total nitrogen was 15.9 per cent, the monoamine-nitrogen 12.59 per cent, nitrogen of bases, 1.51 per cent, acid amide nitrogen 1.68 per cent, and contained approximately tryptophan 1 per cent, tyrosine 7 per cent, cystine 1 per cent, arginine 5 per cent, and lysine 1 per cent.

M. Wagenaar found (*Chem. Weekblad.*, vol. 24, p. 258) that when a drop of 0.1 N-iodine in potassium iodide solution was warmed with one drop of the sample to be tested and a quantity of 30 per cent acetic acid, and a tiny drop of 3 per cent permanganate solution added, crystals of iodoacetone separated at once if citric acid were present. He found further that no reaction

was given by tartaric, malic, succinic, lactic, or oxalic acids. Of considerable interest was the survey made by L. O. Wright (*Ind. Eng. Chem.*, vol. 19, p. 750) of the various methods proposed for the detection of methyl alcohol in the presence of ethyl alcohol. He recommended the method by oxidation with potassium permanganate and detection of the formaldehyde formed by means of rosaniline-sulphurous acid reagent which can be used for quantitative work, and he describes a suitable standardized procedure. Glycerol, and pectin which give a similar color reaction, may be eliminated by distillation.

It was found by T. Moore and S. G. Willimott that brown resinous substances were produced when cholesterol was melted or heated in aqueous colloidal solution. At the same time they reported (*Biochem. Journ.*, vol. 21, p. 585) that chromogenic properties similar to those of oxysterol were acquired. They also reported that Robertson's observation on the stability of cholesterol towards oxidation when aerated as an aqueous colloidal solution at the boiling point in absence of brain extract as a catalyst (this is, without the production of chromogenic substances) was not confirmed. Pure adrenaline, according to T. Vacek (*Biochem. Journ.*, vol. 21, p. 457), when dissolved in distilled water takes up only minute quantities of oxygen in the dark, while on the other hand when exposed to visible light, and much more so when exposed to ultraviolet radiation, it takes up oxygen freely. The compound turns pink in the process of oxidation, the intensity of the color being commensurate with the amount of oxygen taken up. Different preparations of adrenaline show different tendencies to oxidation, pure adrenaline in distilled water being more oxidizable than adrenaline hydrochloride.

J. H. Northrup who had been studying the kinetics of osmosis found (*Journ. Gen. Physiol.*, vol. 10, p. 883) that by combining the laws for osmotic pressure and rate of diffusion, an expression is obtained for the rate of osmosis, and this opinion has been verified experimentally in the case of a collodion membrane containing a solution of egg albumen or of gelatin. The results obtained by M. Bridel and C. Aagaard (*Compt. rend.*, vol. 185, p. 147) with enzyme preparations made from *Aspergillus niger* showed that a preparation that acts slowly on sucrose may hydrolyze melezitose rapidly, and vice versa. The non-identity of the enzymes that attack sucrose and melezitose thus demonstrated disproves Kuhn and von Grundherr's view that melezitose is a compound of sucrose and the nature of the non-reducing α -fructose united with the dextrose remains to be determined. According to Rufferd (*Journ. Amer. Chem. Soc.*, vol. 49, p. 1845) the preparation of Grignord reagents was often facilitated by the addition of a small quantity of anhydrous aluminum bromide, freshly prepared by heating aluminum with bromine. The terms oses, osides, homosides, and heterosides were proposed by G. Bertrand (*Bull. Soc. Chem. Biol.*, vol. 9, p. 854) in place of glucoses, glucosides, homoglucoisides, and heteroglucoisides, which were suggested by the International Commission for nomenclature in biological chemistry. L. von Itallie and A. J. Steenhauer found vanillin and piperonal to be valuable reagents for alkaloids. They published in tabular form (*Pharm. Weekblad.*, vol. 64, p. 926) the color reactions given with the com-

moner alkaloids by these reagents. The most distinctive colors are given by morphine, codeine, apomorphine, aspidospermine, and veratrine.

BIBLIOGRAPHY. Among the larger reference books that were published during the year were the seventh volume of *A Comprehensive Treatise on Inorganic and Theoretical Chemistry* by J. V. Mellor; the fifth edition in two volumes of *Recent Advances in Organic Chemistry* by Alfred M. Steward, and the tenth volume of the fourth edition of Beilstein's great *Handbuch der Organischen Chemie*. Other important works include *A Guide to the Literature of Chemistry* by E. J. Crane and A. M. Patterson; *Old Chemistries* by Edgar F. Smith; *Essays on the Art and Principles of Chemistry* by Henry E. Armstrong; *Introduction to Physical Chemistry* by Meyer Bodansky; as well as the following special treatises: *Equilibria in Saturated Salt Solutions* by Walter C. Blasdale; *Pyrometry* by William P. Wood; *Flame and Combustion in Gases* by William A. Bone and *A System of Qualitative Analysis for the Rare Elements* by Arthur A. Noyes, and William C. Bray.

For full information concerning the books of the year, consult the "Autumn Review Number" of the *Journal of the Society of Chemical Industry* for October 28, pages 981-994.

CHEMISTRY, INDUSTRIAL. The application of the value of chemistry in its relation to the arts and industries is becoming so extensive that more and more the service of a chemical engineer is regarded as essential in every great commercial undertaking, and it may be well said that the progress in the development of industrial chemistry had never been greater than during the year 1927.

ORGANIZATIONS. The spring meeting of the American Chemical Society was held in Richmond, Va., during April 11-16. The registration showed 1317 names, and nearly 300 papers and addresses were presented, including an evening address on "A Chemical Concept of the Origin and Development of Life" by Victor C. Vaughan. He pointed out that the difference between living and dead matter is that the living matter trades energy with its environment, and the character of that environment determines the form of this living protein matter. So long as the environment remains unchanged the characteristics of this living matter are unchanged. In other words there is no life save in proteins. New sections designated as Porto Rico, Northern Ohio, and Princeton Sections were organized. Richard Willstätter was made an honorary member and Wilhelm Ostwald and Walther Nernst were restored unanimously to that class. The opening of a new chemical laboratory at the University of Richmond with appropriate addresses was a feature of the meeting. The autumnal meeting was held in Detroit, Mich., during September 5-10, at which the registration showed 1618 members and guests present. In addition to the reading of papers, and the usual routine business and entertainments, the establishment of a South Carolina Piedmont Section was announced. The presidential address was on "Reflections" and a public address by Charles F. Kettering on "The Functions of Research" was delivered. During the year George D. Rosengarten of Philadelphia served as president.

National Institute of Chemistry. There was authorized at the spring meeting of the Ameri-

can Chemical Society a National Institute of Chemistry to be held under the auspices of the American Chemical Society and to serve as a clearing house for international developments in chemical science and a training school for chemists, and at which world leaders in chemistry would deliver lectures and direct conferences and courses. A committee was appointed in charge of the Institute consisting of Gerald L. Wendt, Dean of the School of Chemistry and Physics, Pennsylvania State College; Prof. Frank C. Whitmore, head of the Department of Chemistry, Northwestern University; Willis R. Whitney, director of the Research Laboratory of the General Electric Company, Schenectady, N. Y.; C. M. A. Stine, chemical director of E. I. du Pont de Nemours & Co., Wilmington, Del.; C. E. K. Mees, director of research and development, Eastman Kodak Company, Rochester, N. Y.; and Frederic W. Willard, Western Electric Company, Chicago. A series of 22 conferences were held during July 4-30 at Pennsylvania State College, at which a wide range of subjects were discussed by various authorities. The foreign speakers included Dr. Hans Tropsch of Germany, Dr. Eric K. Rideal of Cambridge, England, Dr. J. C. Drummond, of London, and others.

Society of Chemical Industry. The 46th annual meeting of this society was held in Edinburgh during July 4-9. During the year 254 members were elected, bringing the present membership up to 4716 as against 4302 last year. The society's medal was presented to Lieut.-Col. G. P. Pollett, D.S.O., in recognition of his conspicuous services to applied chemistry. In addition to the retiring address on "Industrial Chemistry and Progress in Medicine" by President F. H. Carr, Colonel Pollett gave a lecture on "The Development of the Synthetic Nitrogen Industry in Great Britain." The treasurer reported a balance of £540 of receipts over the expenditures, a much improved condition over last year. President Carr was reelected and E. W. Smith succeeded E. V. Evans as honorary treasurer, and E. Frankland Armstrong was chosen as secretary in place of H. Levinstein, retiring. New York was selected as the meeting place for 1928. Visits to important industrial works as well as excursions to historic places as usual were attractive features of the meeting.

London Chemical Society. The annual meeting of this organization was held in London on March 24. The number of fellows elected during the year was 242 bringing the total number up to 4093 as against 4083 in 1926. The address of the President, Prof. H. Brereton Baker, was on "Experiments on Molecular Association." President Baker was continued in office.

The eighth conference of the *International Union of Pure and Applied Chemistry* began in Warsaw, Poland, on September 5. More than 100 chemists were in attendance. Prof. Ernst Cohen of Utrecht, Holland, president, called the first meeting to order. The work was largely devoted to chemical nomenclature and thermochemistry. Numerous American delegates were present, but neither Germany nor Russia was represented.

NATIONAL EXPOSITION OF CHEMICAL INDUSTRIES. The 11th occurrence of this valuable factor in the development of the chemical industries was held in the Grand Central Palace in New York City during September 26-October 1.

There were 372 exhibitors, including several from Germany, admitted for the first time. Conspicuous among these exhibits was one of methanol or synthetic wood alcohol which is now being manufactured in the United States at a lower cost than the Germans can produce it. It was announced that the same process conducted under slightly different conditions would produce synthetic gasoline. In the possession of plants capable of producing methanol the United States has a guarantee against a fuel famine if her oil resources should ever become exhausted. The raw material used in the manufacture of methanol, and which could be employed for making artificial gasoline, is plentiful and cheap. It is simply air. The manufacture of methanol was begun in the United States within the year. Methanol was first manufactured in Germany and began flooding the American market in 1925 to the discomfiture of the wood distillers, whose process was much more costly. American chemists however found a method of making methanol more economical than that of the Germans, because they produce methanol as a by-product of other valuable materials. One company makes methanol in the course of manufacturing synthetic ammonia. The oxygen is taken from the air by being passed over coke. The oxygen and the carbon of the coke form carbon monoxide. The remaining nitrogen is combined with hydrogen to produce ammonia. The carbon monoxide formerly was waste product; now it is forced into combination with hydrogen by means of a catalytic agent whose nature is kept secret. This combination is methanol. Another company engaged in making butanol, a solvent for lacquers and the like, also is manufacturing methanol. Butanol is made by the distillation of fermented corn. The products of this distillation are butanol, grain alcohol, and acetone. A gas consisting of a mixture of carbon dioxide and hydrogen is given off, and by the use of a catalytic agent they are united to form methanol.

MEDALS. On January 14, the Perkin medal of the American Section of the Society of Chemical Industry was conferred on John E. Teeple for "significant scientific, technical and administrative achievements, particularly the economic development of an American potassium industry at Searles Lake, California." On March 11, the William H. Nichols Medal of the American Chemical Society was presented to Dr. Roger Adams, Professor of Organic Chemistry and Head of the Chemistry Department, University of Illinois, for his work on "Acids of Chaulmoogra Oil and Related Compounds." This medal is awarded annually for the best article tending to stimulate original research in chemistry, that appeared in a publication of the American Chemical Society within three years of its award. On May 11 the medal annually awarded by the American Institute of Chemists to the chemist whose work has been of outstanding value to science was presented to Prof. Lafayette B. Mendel who fills the chair of physiological chemistry at Yale University. On May 27, the Willard Gibbs Medal of the American Chemical Society was conferred on Professor John J. Abel of Johns Hopkins University in recognition of the scientific achievements by which he has become accepted as the "chief of the forces of science in creating human happiness," conspicuously shown by his isolation of adrenalin and insulin. On

March 24 the Longstaff Medal of the London Chemical Society was presented to Robert Robinson in recognition of his studies on the constitution of and synthesis of the coloring matter of flowers and also for his investigations of the mechanism of reactions in organic chemistry; and on November 8, Prof. Arthur A. Noyes of Pasadena, Calif., was awarded the Davy medal of the Royal Society of Great Britain.

CHROMIUM. The prolongation of the life of mechanical parts subject to unusual wear of temperature and the production of a permanent decorative effect are the main objects of the use of chromium plating in automobile manufacture. The method followed in applying the chromium surface is as follows: The first step is to produce as smooth an undersurface as possible by plating the parts with copper and nickel and buffing them to a high finish. A steel base, when coated with nickel-plating 1-1000th inch thick and chromium plated, will withstand a salt spray test for 80 to 100 hours, whereas nickel-plating alone of this thickness will stand only 15 hours' test. Chromium does not tarnish under ordinary exposure to weather and the cost of chromium plating, even over copper and nickel, is not excessive. The chief material used in chromium plating is chromium trioxide which contains about 50 per cent of chromium metal. High current densities are used, with very short immersions in the plating baths. Hardness of the chromium can be controlled, and it can be deposited soft enough to be buffed, but the greatest lustre can be obtained by depositing it in its bright or hard state. Light coatings applied over nickel or copper and nickel are extremely hard, and will hold up under ordinary usage on car parts for very long periods.

The expanding uses for chromium emphasize its growing importance in the industrial world. During the period from 1830 to 1870 the United States supplied the greater part of the world requirements, chiefly from Maryland. Leadership in world output passed in 1870 from the United States to Turkey, which was until about 1908 the leading producer. From 1908 New Caledonia and Southern Rhodesia ranked about equally as the two major sources of supply. Secondary sources are Cuba, Greece, and Russia. World production of chromite, the ore from which the metal is derived, was approximately 360,000 tons in 1926. This compares with a wartime maximum of 283,000 tons. In 1926 the United States took 215,000 tons, or about 60 per cent of the estimated world output and more than consumption.

COFFEE. A method for the agglomeration of the slime and fine particles in leaching of ores, discovered at the Southwest Experiment Station of the U. S. Bureau of Mines at Tucson, Ariz., was announced in August. It is believed to hold promise of wide application in the metallurgy of copper and other ores. Millions of tons of tailings from copper concentrators, too low grade for treatment by other processes, offer possibilities of successful treatment by this method. With the newly discovered method the slime and fine particles can be agglomerated and the state of agglomeration maintained in such a manner that masses of ore containing finely divided material can be made permeable to downward trickling leaching solutions, provided open drainage is maintained at the bot-

tom and that the solutions are not allowed to pool on the surface. Experiments have shown that the increase in possible percolation rate produced by agglomeration with open drainage is between 5 and 40 times, depending upon the character and proportion of the slimes present. Also by this method advantage can be taken of oxygen from the atmosphere entering into the chemical reaction of leaching. The principle is also of value in vat leaching, as it tends to prevent channeling of the solutions through the ore. The development of this principle should make it possible to treat finely divided ore or tailings by heap-leaching principles, and thus avoid costly tank construction.

GOLD. According to a press dispatch from Paris dated May 21, Jollivet Castelot of Douai, France, reports that his process of producing gold synthetically is commercially profitable. With 6 grams of silver, 2 of sulphur of antimony, 1 of orpiment and 1 of tin, he claimed to have produced 10 milligrams of gold. He melts the metals, heating them to 1100 degrees Centigrade, and a complicated process ends in precipitating the gold. The addition of tin had improved his earlier process. He claimed that, besides gold, almost all the original quantity of silver is recoverable.

IRON. A synthetic process for refining iron has been experimentally tried in Mahoning Valley as a substitute for puddling. Under the new system, called the Ashton process, the plant equipment consists of a 1½ ton electric furnace, a cupola furnace for melting slag and a 500-ton hydraulic press for squeezing the blooms. The slag is run into an unlined cast iron mould standing upright on a car and the iron is then poured from a bottom-pour ladle, falling 6 or 7 feet before entering the slag. The molten metal has a fusion point of about 2730° F. while the slag fuses at about 2100. When the molten iron is pouring into the slag, enough of the gas in the metal is released to cleanse the iron thoroughly. The wrought iron produced by this process, it is said, has excellent quality and possesses all the characteristics of hand-puddled iron. The new process if successful will entirely in time replace the old hand process.

MOLYBDENUM. The U. S. Bureau of Mines published in February descriptions of two new leaching methods for the recovery of molybdenite from ore that had been carefully tested by their experts and are believed to have commercial possibilities. In one of the methods tested the procedure is to extract the ore with hot soda solution, acidify with sulphuric acid, add a small amount of sodium acetate and digest with lead sulphate. Molybdenum is completely precipitated as lead molybdate, which can be converted into molybdenum trioxide. In the other process the ore is extracted with warm dilute sulphuric acid and the free acid neutralized with scrap iron. Molybdenum is completely precipitated as hydrate of molybdenum dioxide nearly pure. By treating the hot roasted ore with chlorine practically complete separation of the molybdenum from all other ore constituents is obtained in one operation. The distillate is quite pure and is easily converted to molybdenum trioxide or calcium molybdate. The consumption of chlorine need not be heavy, and the regeneration of chlorine for repeated use seems possible. Formerly molybdenum was added to steel in the form of ferro-molybdenum. At present,

however, most of the molybdenum used in steel is added in the form of calcium molybdate; reduction and combination as alloy result from the contact of the molybdate with the molten steel. This change the bureau believes marks an important economy in the production of molybdenum alloys. The bureau has also investigated the dielectric separation process, an undeveloped method which seems to have limited possibilities.

HELIUM. Of considerable interest is the fact that on July 25 a helium plant in Dexter, Kansas, the second of its kind in the world, was inaugurated. Although a private concern, its entire output was contracted to the United States government for use in lighter-than-air craft. The Dexter helium field, which covers a considerable area in the vicinity of Dexter, was said to be the richest in the world. The only other helium plant was one at Fort Worth, Texas, operated by the United States government. The natural gas from the wells in the Dexter area contains such a high percentage of helium that it is not usable for heating or cooking.

HYDROGEN. Much interest is always shown in information concerning the transmutation of metals and very early in the year detailed reports descriptive of the experiments of Professors Paneth and Peters of the University of Berlin were available in which was described how they had derived helium from hydrogen by means of palladium. If the conclusions of these German chemists are correct then hydrogen atoms condensed by palladium have also the ability to unite with one another in groups of four, which constitutes the helium molecule. A stream of hydrogen gas was passed over palladium in the colloidal state, in which form the maximum amount of surface is exposed, and after 12 hours of absorption the main lines of the helium spectrum were detected. As longer time elapsed the lines increased in intensity. It would require an enormous length of time to produce a sufficient quantity of helium to be isolated and analyzed, but by using an extremely delicate spectroscope the amount of helium formed artificially by this process was estimated to be from one to ten thousand millionths of a cubic centimeter. The transformation of hydrogen into helium, if it can be accomplished, would theoretically involve a loss in weight of eight-tenths of 1 per cent. The matter so destroyed would be transformed into energy and pass off as rays of light and heat. Such an annihilation of energy would produce an enormous amount of heat.

In March Dr. G. B. Kistiakowsky, an International Education Board Research Fellow in Chemistry experimenting in the chemical laboratory of Princeton University, announced his belief that he had disproved the claim that helium can be produced from hydrogen in the laboratory. In commenting on Dr. Kistiakowsky's research, Prof. Hugh S. Taylor explained that whatever helium was observed during the experiments could be attributed to the minute leakage of air into the apparatus. The results of the experiments in Princeton were made known to Professor Paneth and he accepted them, since in his later work he attributed the presence of helium in his apparatus to the asbestos used as a carrier for the palladium catalyst. No asbestos was used in the Princeton experiment.

NITROGEN. The United States which in 1912 had no plants for the fixation of atmospheric nitrogen, in 1927 had seven synthetic ammonia installations with a combined capacity of about eight tons a day. While none of this output was finding its way as yet into agricultural use, it was having the indirect effect of forcing additional quantities of by-product ammonia into the fertilizer market. Projected plans for the expansion of the industry, according to reports issued by the Department of Agriculture, indicated that before many years the products of atmospheric fixation will be competing directly in the United States with other sources of fertilizer nitrogen. In the synthetic-ammonia process, the method of atmospheric nitrogen fixation, in which practically all commercial effort in the United States is concentrated, purified hydrogen and nitrogen gas are made to combine at high pressure and temperatures so as to form ammonia. The ammonia thus obtained is readily transformed into salts suitable for use as fertilizer. Fixed nitrogen because of its limited occurrence in nature, presents the greatest problem in the maintenance of soil fertility. Nitrogen from the air is the logical ultimate source of supply, since free nitrogen comprises four-fifths of the air. The development of atmospheric nitrogen fixation promises greatly to increase the world's supply of nitrogen and incidentally to promote improvement in the production of fertilizer materials. Already better and more concentrated fertilizer salts are being produced and marketed as a result of the construction of synthetic nitrogen plants.

STEEL. In January a new process for making a form of case hardened steel known as "nitralloy" was demonstrated at the Ludlum Steel Company's plant in Watervliet, N. Y., and the problem, which was solved in the research laboratories of the Krupp works at Essen, Germany, and of Aubert and Duval Frères of France, was to obtain the required surface hardness in a commercial and practical way while at the same time maintaining accuracy of design and a surface unimpaired by the process. The result has developed a process which can be carried out at a remarkably low temperature, and the ultimate hardness is obtained without the necessity of further heat treatment and the consequent deformation, distortion, and breakage often experienced in this necessary part of the case hardening process. The new process of "nitriding" (or nitrifying) is based, as in the case of carbon case hardening, on the phenomena of diffusion, but, instead of carbon, nitrogen is allowed to penetrate the surface of the finished metal to be hardened which must be a steel of suitable analysis. The process of "nitriding" is so conducted that a current of ammonia passes over the metal previously placed in vessels of suitable shape, or design. A temperature not exceeding 55°C. is used and the time required is based upon the depth of case desired. Advantages claimed for the new steel are that clean surfaces are assured and the metal leaves the furnace with no tension. There is no warping. The shape of the metal remains intact. The metal thus treated is not subject to breakage and the high percentage of waste is eliminated. The finished articles are machined before "nitriding" is done. Even polishing takes place before processing.

Announcement was made in February of the

perfection of a new steel, from 10 to 50 times as durable as the ordinary product, by the Crucible Steel Co. of America.

SPONGE IRON. In the *YEAR BOOK* for 1924 (p. 149) reference was made to preliminary investigations undertaken by the U. S. Bureau of Mines in the great value of this product. *Bulletin* (No. 270) affords the following additional information on the subject: Sponge iron will precipitate copper, lead, and numerous other metals from solution. The reaction takes place more quickly than when a massive form of iron, as steel scrap or pig iron, is used as a precipitating reagent, and thus plant capacity is proportionately enlarged. Sponge iron is likely to be increasingly important in the hydrometallurgy of low-grade copper and complex lead ores; its production insures a permanent and reliable source of metallic iron—a matter of much importance in view of the small supply of scrap iron and the distances that separate most copper and lead mines from iron-producing centres. It is conceivable that the future success of some large-scale leaching and precipitating processes for copper and lead ores may depend upon a supply of cheap sponge iron. In some chemical processes finely divided metallic iron is used as a reducing agent, and iron oxide is obtained as a by-product. This oxide could be converted into sponge iron and used again in the reduction process. In regions remote from iron and steel producing centres, where coke is expensive and electric energy cheap, sponge iron made cheaply from iron ore and low-grade coal can probably be converted in the electric furnace into iron and steel that can compete with the imported products. The fact that both electric melting and the production of sponge iron can be conducted economically on a small scale makes such a process particularly advantageous in communities that do not consume much iron or steel. Electric furnace processes, being inherently expensive, are not advocated for the manufacture of iron and steel except where conditions are unusual. Other uses of sponge iron will probably be developed once production has been established on a large scale. Some experiments have been made with respect to the use of sponge iron for the production of hydrogen from steam, the iron oxide formed in the process to be converted to sponge iron.

STUDIES IN PETROLEUM. The programme of research mentioned in the *YEAR BOOK* for 1926 (p. 158) was initiated by John D. Rockefeller who in November, 1925, proposed in a letter to Robert L. Welch, General Secretary of the American Petroleum Institute, to provide a fund of \$250,000, this sum to be made available in annual installments of \$50,000 each over five years. The fund is administered by a committee consisting of Mr. Welch, Walter C. Teagle, president of the Standard Oil Company of New Jersey, and K. R. Kingsbury, president of the Standard Oil Company of California. In January, 1926, the Rockefeller fund was supplemented by a similar amount provided by the Universal Company. Since the undertaking is planned to be the most exhaustive of its character ever attempted in the petroleum industry, it has proceeded slowly. The American Petroleum Institute obtained the coöperation of the National Research Council of Washington which appointed in 1926 a Central Petroleum Committee of which Dr. James F. Norris, Professor of Organic

Chemistry of the Massachusetts Institute of Technology, became chairman. The committee recommended 31 projects in fundamental research, covering in the broadest manner the geology, physics, and chemistry of petroleum. Of these projects 29 have been assigned and the work already begun in the laboratories of various universities and scientific institutions.

SYNTHETIC GASOLINE. Reference was made in the *YEAR BOOK* for 1926 (p. 159) to the invention of a synthetic gasoline in Germany by Franz Fischer. In August the additional announcement was made that the Bergius process for producing crude oil and gasoline had been perfected in the experimental plant in Merseberg, so that the production of an artificial gasoline was "declared to be a practical undertaking." It was confidently predicted by conservative authorities that before 1928 fully 20 per cent of Germany's consumption of motor fuel would be supplied from this source. It was also said that the Standard Oil Company of New Jersey had concluded negotiations with the German Dye Trust for "the mutual use of processes under certain patent rights" in anticipation of future needs for a synthetic motor fuel. Later announcements were that French scientists had discovered a process of making gasoline synthetically. It was well known that Patart and Audibert had long been at work on this problem in France.

Other reports from Paris showed that two French chemists, Prudhomme and Houdry, after long investigation and experiment had solved the problem of making gasoline from lignite in commercial quantities. It was claimed for their discovery that from 20,000,000 tons of lignite a year they will be able to manufacture within ten years at least 1,000,000,000 liters of gasoline yearly and 600,000,000 liters of coarser oil, which will meet at least half the consumption of France.

A press report from Lisbon, Portugal, in August told of the invention of a substitute for gasoline, which may solve the problem of a concentrated fuel for long-distance aviation, by Ramon Ribeiro, a Portuguese engineer. Trials of the substance, said to have been successful, were carried out at a military airdrome, when the fuel, which it is said has 80 per cent greater efficiency than gasoline, was used in motor-cycles.

A press telegram from Frankfort-on-Main, Germany, dated October 8, announced that satisfactory progress in the production and marketing of its synthetic benzine was reported to the executive board of the German Dye Chemicals Corporation.

MOTOR FUEL. According to a report to the Department of Commerce by the U. S. Trade Commission in Rome, chemists in Europe were seeking a method of substituting for the imported motor fuel some product of the available natural resources. In Milan, Italy, serious efforts to utilize the lignite deposits in the extraction of oil by the cracking process had been made. The technical possibility of obtaining liquid fuel from coal had long been known, but only recently had the production of a sufficient amount of fuel to overcome the cost of raw materials been demonstrated. As the consumption is steadily increasing, the only apparent way to reduce imports of gasoline is to find some agent to mix with it for the production of an equally good carburetant. France, with the same problem, has

decreed that 10 per cent native ethylic alcohol must be added to gasoline. In Italy a decree was issued in June, 1926, ordering a prescribed percentage of denatured alcohol to be mixed with gasoline used for automobiles. Its enforcement was postponed to Jan. 1, 1927, but so far the amount of alcohol to be used has not been specified. Technically it has been ascertained that alcohol can be mixed with gasoline as a motor fuel without necessitating changes in motors or carburetors, but an economical production of sufficient alcohol to be used generally for this purpose is still a subject of discussion.

A series of experiments were carried on during the year by the Purdue University engineering experiment station regarding the carburation of heavier fuels. These experiments were conducted with kerosene and other fuels. Results of the experiments have been published in a bulletin issued by the station, which presents data on the carburation of kerosene and provides additional information concerning the effect of fuel volatility on the carburation problem. Its purpose also is to show how an engine operating on kerosene reacts to variations in the strength and temperature of the mixture, to point out the optimum temperature for satisfactory performance and to specify the correct mixture ratios for economy and power.

In September a press statement was made by the U. S. Bureau of Mines that three chemists had been experimenting with artificial production of oil—David W. Smith, J. D. Davis and D. A. Reynolds—and had produced fuel from water gas with the aid of different catalysts. The methods used had hardly been commercially practicable, although the experiment was considered a success as a laboratory test. The stimulus that started them to work on artificial petroleum was the secrecy surrounding the catalysts used by oil making chemists, particularly the Germans. So these three government chemists, in the laboratory of the Bureau of Mines set to work to discover just what catalysts could be used to make artificial petroleum. They tried six different catalysts, all of them mixtures of metals in a finely divided state, exposing a great deal of surface to the action of the gases. The most effective catalyst was one made up of metallic cobalt and manganese oxide, with a small amount of metallic copper which produced from water gas a mixture of hydrocarbons, ranging from the simple gaseous forms to those forming a clear, oily liquid. Another catalyst, consisting of cobalt, uranium, and copper brought down a substance resembling white vaseline.

ANALYSIS OF CRUDE OILS. The method of analysis adopted by the Bureau of Mines for its surveys of crude petroleum is a modification of the Hempel distillation method. It involves the distillation of a sample of crude oil under carefully controlled conditions that can be duplicated readily, and the subsequent examination of the series of successive fractions thus obtained. In addition, the gravity, color, viscosity, pour point, and the sulphur are determined. In describing a crude oil reference is often made to its supposed base. It would seem that the word "base" is used much as it is in pharmaceutical work. For example, the "base" of an ointment or salve is the fatty material used as a vehicle or carrier for the active medicinal principles. Many of the pioneers in the petroleum industry

conceived of crude oil as consisting of a semi-solid non-volatile "base" and a volatile portion which could be distilled off. Many crude oils when chilled slowly will deposit a waxy material, and this fact may explain why these oils were classed as having a "paraffin base." Historically, it happened that the oils first discovered in this country were mostly of this kind, and it was only when the oil industry developed in California and along the Gulf Coast that oils were found that contained no wax but which apparently did contain asphaltic material. These oils became known as "asphalt base" oils, although the more descriptive term "naphthene base" is sometimes used in place of "asphalt base." Oils that cannot be assigned to the "paraffin" or "naphthene" groups are classed as "intermediate-base" crudes, which in general resemble "paraffin-base" crudes much more than they do "naphthene-base" crudes. It would seem that a fourth type of crude exists that resembles a true "naphthene base" crude except that it contains a small amount of waxy material, which has been given the name "hybrid-base" crude. It is often assumed that the gravity of a crude oil is a fair measure of its character. However, the gravity of a naphthene-base crude is much heavier than that of an intermediate or paraffin base crude of the same general quality, hence gravity taken alone is not sufficient to establish the identity of a crude oil. The physical appearance of a crude is indicated in the analysis not only by the gravity but by the color, the pour point and the viscosity. The color of a crude oil may range from a very light yellow up to a brilliant brownish black. For oils that are transparent when viewed in a four-ounce bottle by transmitted light the Bureau of Mines uses the National Petroleum Association color scale. Most oils however, are opaque when viewed in this way, and the color by reflected light is reported as follows: If the oil is clear in color it is reported as "green," "dark green," or "greenish black"; if it has a brownish or muddy appearance it is reported as "brownish-green" or "brownish-black." In making an analysis of a sample of crude oil the percentages of free water and emulsified water should be recorded. The percentage of water present is of interest to oil producers and purchasers, but its presence has no bearing on the character of a crude oil.

SYNTHETIC LUMBER. From time to time processes for the utilization of refuse wood chips have been published. The Science News Service of Washington issued the following in June of 1927: The use of steam for exploding wood chips into fibre is the ingenious process at the basis of a new method for producing synthetic lumber from sawmill waste. This development promises to eliminate a waste in wood which in the past has been considerable. The fundamental process consists in subjecting chips of a uniform size to a steam pressure of 800 pounds for four or five seconds. Then by an instantaneous release of the pressure the chips are made to explode into millions of fibres. To form boards the exploded fibre is refined, passed over a four-drummer similar to a paper machine and placed in a press. Almost any desired degree of hardness may be secured by simply varying the pressure. No glue or other artificial binder is required to consolidate the fibre. The product is all wood, it has a tensile strength of from 4000 to 5000 pounds to the square inch, it is knotless, of very

light weight, and a good insulator. The uses for which is said to have already proved satisfactory include desk tops, card tables, radio panels, wall board, paneling, and insulation.

CORN STALKS. Dr. O. R. Sweeney of Iowa State College and his aides have been experimenting since 1920 in an effort to develop the latent wealth of the corn plant. Samples of products made from corn and corn stalks, including food for diabetics, building blocks for skyscrapers, artificial lumber, "maple" syrup, corn cob pipes, embalming fluid and many types of wood substitutes were shown by him at the Exposition of Chemical Industries. Corn is the world's greatest crop but now it is only partly utilized. The value of the corn crop is about \$2,000,000,000 a year. The stalks are largely waste material. Not more than 8 per cent of the total production in the United States of 200,000,000 tons a year is utilized. If the industrial possibilities of the stalks were being realized another \$1,000,000,000 a year would be given to the corn growers. Dr. Sweeney built an experimental factory in his laboratory at Ames, Ia., where he is manufacturing artificial lumber, paper, building blocks, artificial silk, and other products. He showed a slab of board designed to be used as insulation in the building of houses that could be sold at retail for \$40 a 1000 square feet, while the cheapest ship lath now costs \$45. Besides its cheapness, the corn stalk insulation board is more than four times as good an insulator as wood lath, thus insuring that a house will be cool in summer and warm in winter and it will make a stiffer, stronger house.

Wood of any degree of hardness could be made by grinding up the stalks, beating the resultant flour until it is the consistency of jelly, and allowing it to dry in molds. Furniture made of such wood is immune from warping. Building blocks made of a mixture of corn stalks and clay are superior to those of gypsum now used for inside construction work. They are as light as gypsum and superior as heat insulators. Corn stalks and oat hulls are being used in considerable quantities for the production of furfural, and from it an embalming fluid has been made which is safer for those handling it than any previously used.

ETHYLENE. Among the interesting papers presented at the Richmond meeting of the American Chemical Society was one by Prof. S. C. Lind giving the results of a series of experiments conducted in the chemical laboratory of the University of Minnesota on the use of ethylene gas for the quick ripening of fruit. Ethylene, each molecule of which contains two atoms of carbon and four of hydrogen, may be produced in unlimited quantities cheaply. It takes a very small amount of this gas, released in air, to ripen a closed chamber full of green fruit. It has been known that ethylene would color the skins of fruits, such as bananas and oranges, but its value in ripening fruit was not recognized. In the ripening room in St. Paul, green celery was placed and released. It was rapidly blanched, was found very delicious, and had less stringiness than the celery ripened in the sun. The experiments were then applied to other fruits with excellent results. This process reduces the acidity of fruit and increases the sugar, or changes it from greenness to ripeness. The product is more palatable, and a fruit crop instead of being placed on the market all at once may be dis-

tributed over weeks, thereby saving the producer money and providing the consumer with good fruit at reasonable prices for a longer time than usual. Demonstrations of ethylene for the preservation of fruit were a feature of the National Exposition of Chemical Industries in September.

SULPHUR AS A PRESERVATIVE. According to Dr. Ludwig Rosenstein of San Francisco, Calif., the use of finely divided sulphur powder has attained great importance as a material for dusting grape, orange, asparagus, and other plants afflicted with insect and fungous pests. The sulphur seems to be acted on by moist air to give products which attack the pest. Unfortunately, sulphur is not directly soluble in water, so that its usefulness depends on the amount of surface of the solid powder, and no ordinary grinding process will divide the sulphur into grains as small as those of the new product. Dr. Rosenstein's new ultra-fine sulphur comes as a by-product of his process for extracting the undesirable hydrogen sulphide from household fuel gas. In the process a little nickel sulphide is intimately mixed with the sulphur, and it is suspected that the accidental presence of this nickel compound is partially responsible for the great potency of the resulting sulphur dust. While ordinary "flowers of sulphur" will kill the red spider pest fairly readily, the new dust kills both eggs and mature insects. The by-product sulphur seems to exist as minute globules of a spongy suspension of sulphur in water suggestive of water-soaked grains of gelatin or starch and may derive value from this condition.

Excessive sulphur in gasoline shortens the life of a motor, according to H. C. Mougey, chemist of the General Motors Research Corporation; this important fact was brought out in his paper at the Detroit meeting of the American Chemical Society. He also declared the cause of corrosion in automobiles is water formed by the combustion of the fuel and that the corrosive effect of this water is greatly increased if it is contaminated with acids resulting from the burning of sulphur in the fuel.

PRESERVATION OF STONE. A press dispatch from London, England, in June reported that leading microscopic chemists, studying the crumbling stone of London's finest old buildings, have discovered the presence within the stone itself of bacteria, perhaps literally eating monuments away, and a standing committee of the Department of Industrial and Scientific Research has been appointed to study the effects and devise means for prevention. Because of the ravages of the climate and microscopic plants, such as lichens and mosses, the Parliament Buildings are believed to need refacing at a cost estimated by the Office of Works at £1,000,000. Buildings studied by the chemists include the Tower of London, the Public Records Office, Westminster Abbey, Temple Church, Somerset House, and Chelsea Old Church.

TESTS FOR DIAMONDS. Various attempts have hitherto been made to measure the intensity of the iridescence of diamonds by photographic means, but solar light has always proved too diffused for accurate results. According to a press dispatch from Paris in June, M. Malaval, a chemist attached to the Lyons police laboratory, has invented a method to test the quality of diamonds. He has obtained perfect results with ultra-violet rays passed through a screen,

The purest white stones give the clearest picture, yellow stones showing darker, while imitation diamonds show quite black. It is claimed that this method will make it impossible to substitute stones of lesser value for real diamonds placed in deposit, for example. All the possessor of the diamonds need do will be to get an ultra-violet ray picture made of them before temporarily giving up the stones and then have a second picture made when they are returned. The method will make it possible to decide the exact quality of any diamond with almost mathematical accuracy.

A NEW DISINFECTANT. The discovery of a new disinfectant, called chlorthymol, said to be entirely non-poisonous and much more effective than any other antiseptic or corrosive sublimate, was announced in a press dispatch from Munich in October. It is claimed by the discoverer that the new drug is superior to all other known disinfecting agents and that it kills germs in a remarkably short time and is harmless. For the tests made in Munich tetanus bacilli, known as the toughest of germs, were used. Wounds of animals were infected with four times a deadly quantity of germs and the disinfection delayed for many hours. A day after inoculation, killing of the germs was accomplished in a short time and the animals were saved. After twenty-four hours, when tetanus had already set in, the experimenters succeeded in saving 50 per cent of the animals. The opinion was expressed that chlorthymol may be useful in fighting leprosy and tests in that direction will be made in Java.

MOTH FUMIGANT. The discovery of a new clothes moth cure, known as cinchona alkaloids, was announced on October 1 by the Mellon Institute of Industrial Research, in Pittsburgh, Pa. The repellent, which it was said, will save millions of dollars in clothing, was found after six years' work by Lloyd E. Jackson and Miss Helen E. Wassel. According to the discoverers products of the cinchona alkaloids have been shown to meet criteria of excellence heretofore unsatisfied by other moth repellents. They are inodorous; they adhere to the materials to which they are applied, can be put on evenly like a dyestuff; they are not apparent on the materials treated; they do not dust off; they do not affect undesirably the physical properties of textile fabrics; they can be made soluble in inexpensive organic solvents, such as petroleum naphtha, as well as in water; they are non-toxic to human beings; they are valuable clothes moth repellents and are economical to use industrially.

Chemists in the employ of the Federal Government have also been experimenting for some time on methods of eradicating moths which destroy cloth, and on ways to prevent roaches and other insects from destroying books and papers.

THERAPEUTIC VALUE OF DYESTUFFS. According to Dr. Hugh H. Young in an address before the American Chemical Society, dyestuffs have remarkable therapeutic properties, particularly in the treatment of desperate cases of blood poison. His experiments hold forth great prospects in the future treatment of infections and infectious diseases. Researches over a period of ten years have been made with hundreds of dyes. Efforts have been made to find drugs that were germicidal, non-toxic, non-irritating, and efficient in serum, urine, bile, and other body fluids. Three new drugs have been produced of great value in certain infections on account of the penetration

afforded by the dye and efficient germicidal effect. With one in particular, mercurio-chrome, remarkable efficiency has been shown not only in the local treatment of infections but in intravenous therapy. A 1 per cent solution is injected into the blood stream in doses of from three to five milligrams to the kilogram of body weight. Over 1000 cases have been collected of local and general infections, with a high percentage of immediate improvement and many remarkable apparent cures. In some cases of blood poison where the condition was desperate the results have been satisfactory.

POSITION OF CHEMICAL EXPORTING COUNTRIES. In August the Department of Commerce published (*Commerce Reports*, Aug. 29, 1927, p. 550) the following statement which is here somewhat condensed: Immediately following the close of the war, undoubtedly the United States was the largest chemical exporter. During the period of readjustment and recovery after the world depression in 1921, and continuing for three years through 1924, England and the United States were close competitors for the leadership in the world chemical trade. In 1925, however, Germany forged ahead, increasing its trade by \$33,000,000, or 61 per cent, over the 1924 export. In 1926 the figure of \$256,000,000 was attained, a much smaller increase, nevertheless, over the 1925 figure (only \$36,000,000, 17 per cent). This total of over \$256,000,000, however, made Germany the world's largest chemical exporter and exceeded the United States figure by \$85,000,000. The United States took second place with \$171,000,000, England third with \$125,500,000, and France fourth with \$114,000,000. In 1926, Germany's chemical exports were 50 per cent in excess of the United States' and more than double both those of France and England. During the past two years the depreciated value of the French currency and economic difficulties, such as the coal strike in England, have had an adverse effect on the chemical trade of the two countries. Germany's rapid ascendancy to this high position may be attributed largely to a more extensive world consumption of chemicals in general and to the development of a big export business in several commodities, particularly ammonium sulphate and synthetic methanol. During this five-year period the United States has gained 40 per cent, yet this rate is much lower than it should be, especially when it is considered that the United States is not only the world's largest producer and consumer but also the world's largest importer of chemicals, and that in 1925 only 7½ per cent of its total chemical production was exported. The table below shows the chemical export trade of the four countries by groups. As is generally recognized, the United States is the world's most important exporter of naval stores (rosin and turpentine), sulphur, and prepared medicines. It is also counted as one of the leading factors in the phosphate rock, toilet preparations (especially dentifrices), and pigment, paint, and varnish trades. The addition of the nitrogenous fertilizer compounds, particularly ammonium sulphate, to the already established potash industry has placed Germany as the foremost fertilizer-exporting nation of the world. Its position as the largest exporter of industrial chemicals and coal-tar products has also been maintained. Undoubtedly England leads all other countries of

the world as an alkali exporter and is also an important shipper of crude coal-tar products, such as tar, pitch, and creosote oil, and some of the fine chemicals, such as prepared medicines and toilet preparations. Somewhat similar to the United States, England also has assumed a prominent position in the dye export trade. France, without a doubt, stands out above all other countries as the world's largest exporter of perfumery, perfume materials, and essential oils. It is also important as a source for some industrial chemicals and potash, and follows the United States as the next largest exporter of naval stores.

adopted by the European steel trust, the chemical trust would greatly reduce the cost of distribution and selling by using one line of ships instead of two, and in other ways eliminating competitive distribution. In Europe the trust will divide the markets, Germany serving one field, France another, and Great Britain still another, largely reducing overhead costs.

This movement, naturally, seriously threatened American interests, notably the great dye industry, so splendidly organized in the United States at the time of the World War. In 1914, the value of the chemical and allied products of industries in the United States was a little

CHEMICAL EXPORTS OF FOUR MAJOR EXPORTING COUNTRIES IN 1926

Commodity	[In thousands of dollars—000 omitted] United States	France	England	Germany
Coal-tar products	14,093	8,211	16,323	58,229
Industrials (including sulphur)	89,761	81,901 ^a	47,516	67,792
Fertilizers and materials	20,500	15,285 ^a	14,894	66,402
Explosives, matches, pyroxylin	7,251	1,528	4,712	7,768
Naval stores, pigments, paints, varnishes	55,752	16,672	22,104	23,659
Medicinals and toilet preparations	28,082	32,682		28,676 ^b
Essential oils, crude drugs, natural dye extracts	5,866	7,996 ^c	20,477	8,524
Total	171,805	114,225	125,526 ^c	256,050

^a Fertilizers higher and industrials smaller than given, on account of inclusion of some potash in industrials.

^b Includes crude drugs.

^c Probably 5 to 10 per cent more.

EUROPEAN CHEMICAL TRUST. In September rumors of the proposed union of European chemical interests were prevalent, as manifested by the increasingly friendly spirit between the British and German chemical manufacturers. In the United States apprehension yielded to a distinct opposition to an international control of chemical products which was conspicuously shown by articles in *Industrial and Engineering Chemistry*, an official organ of the American Chemical Society, in which it was held that the movement to erect in Paris a world centre of chemistry as a memorial to the great chemist, Marcellin Berthelot, the centenary of whose birth was celebrated on Oct. 25, 1927, was a thinly disguised ruse. This movement which sought to raise \$500,000 in the United States failed to receive the official approval of the American Chemical Society, and its president, Dr. George D. Rosengarten, acting on the unanimous advice of the executive council of the society, declined to become a member of the American Organizing Committee.

On October 15, there came from Paris the announcement that another link in the European industrial trust had been forged by the formation of a Franco-German entente. Early in 1926 the English and German chemical trusts were united by an agreement between the British Imperial Chemicals, Ltd., and the German dye trust. It was predicted at that time that the next step in the formation of the international cartel would be the entrance of France. All the principal French chemical industries were organized into the Union Chimique, so that the French chemical industry could enter the combination on the same organized basis as had the English and German industries. Italy and Switzerland were expected to join later.

The world market was divided under tentative plans laid for a unit sales system, which consists of the establishment of sales organizations at strategic points throughout the world. Through this method, which, was soon to be

above \$2,500,000,000. In 1923, according to census figures, the annual value of these products had jumped to over \$5,706,000,000. Unofficial estimates for 1926 fix their value for that year close to \$6,000,000,000. The value of exports of American chemicals in 1914 was a little more than \$27,000,000 but in 1926 it had increased to \$171,000,000.

Francis P. Garvan, president of the Chemical Foundation, was reported in the *New York Times* as follows: "Don't make the mistake of thinking this is a dye fight, or a nitrate fight, or a rayon fight, or a fight for Asiatic or South American markets. No, it is a fight to reassert European (in reality German)—the French and English have been duped) supremacy in chemistry and chemical progress, and that means German military supremacy and German industrial supremacy and German supremacy in drugs and potential necessities. America will never join such a combine. Germany may lull France, England, Italy, and Switzerland to sell their chemical independence and progress for a miserably small percentage of present business. But enlightened American industry, enlightened American opinion, and enlightened American legislation will not allow our betrayal."

The leaders in the chemical and allied dye-stuffs industries in the United States were endeavoring to secure from Congress an amendment of the Sherman Anti-Trust act to permit the organization of chemical combinations in the United States as a means of meeting the intensive competition threatened by the newly formed chemical trust in Europe. The argument was made that, unless the restrictions imposed by the Anti-Trust law as to industrial consolidation were modified to some extent to permit the forming of the proposed combinations, the United States will lose a large part of its foreign trade in chemicals and allied products and eventually be forced to fight the European trust for control of the domestic market.

NECROLOGY. Among the more important Amer-

ican chemists who died during the year were: Frederick Belding Power of the U. S. Department of Agriculture, who died in Washington, D. C., on March 26; Ira Remsen, professor of chemistry, and later president, of Johns Hopkins University, who died in Carmel, Cal., on March 4; Victor Lenher, professor of chemistry at the University of Wisconsin, who died in Madison, Wis., on June 12; Henry Paul Talbot, professor of chemistry at the Massachusetts Institute of Technology, who died in Boston, Mass., on June 18; Charles Frederic Mabery, professor of chemistry at the Case School of Applied Science, who died in Portland, Me., on June 26; Bertram Borden Boltwood, professor of radio chemistry at Yale University, who died in New Haven, Conn., on August 14. Biographical sketches will be found under the respective names.

BIBLIOGRAPHY. Among the more important books published during the year were the seventh and final volume of the revised and enlarged edition of Sir Thomas E. Thorpe's *Dictionary of Applied Chemistry*, and the second edition of *Principles of Chemical Engineering* by W. H. Walker, W. K. Lewis, and W. H. McAdams. Also to be included are the fifth edition of volume five of Allen's *Commercial Organic Analysis* and Griffin's *Technical Methods of Analysis*. Similar to these was the second volume of the *International Critical Tables* issued under the auspices of the National Research Council. Other works were *The Rayon Industry*, by M. H. Ayram; *Colloids*, by H. R. Kruyt, translated by H. S. Van Klooster; *Titanium, with special Reference to the Analysis of Titaniferous Substances*, by W. M. Thornton; *Phosphoric Acid, Phosphates and Phosphatic Acid*, by W. H. Waggaman; *The Industrial Chemistry of the Fats and Waxes*, by T. P. Hilditch; and *The Making of a Chemical; a Guide to Works Practice*, by E. I. Lewis and George King.

CHESS. Alexander Alekhine of Russia wrested the world's chess championship from José R. Capablanca, title holder since 1921, at Buenos Aires in November, 1927. The final score of the match was six victories for Alekhine, three for Capablanca and twenty-five draws. The tournament began on September 15 and was the longest ever contested. Earlier in the year Capablanca had easily disposed of Alekhine in a tourney held in New York City, the then champion not losing a game, whereas Alekhine finished with a score of 11 1-2 to 8 1-2 to take second place. An international team tournament was held in London in August, Hungary being the winner. Denmark finished second and the British Empire third. The United States was not represented. New York University for the third successive year won the American Intercollegiate Chess League title. The Metropolitan Chess League honors went to the Manhattan Chess Club.

The first world's championship checker match since 1905 was contested at the Hotel Alamac, New York City, the United States team defeating the British by compiling a total of 98 victories, 20 defeats and 366 draws.

CHICAGO. See **CITY PLANNING**.

CHICAGO ART INSTITUTE. See **ART EXHIBITIONS**; **ART MUSEUMS**.

CHICAGO, UNIVERSITY OF. An institution of higher education situated on the Midway Plais-

ance of the Chicago South Park system, Chicago, Ill.; founded in 1890, largely through gifts of John D. Rockefeller. The University, with its affiliated institutions, occupies, for educational purposes, over 65 buildings and 196 acres of land, including the site of the Yerkes Observatory at Williams Bay, Wis. The net total registration for the autumn quarter of 1927, exclusive of the home study department, was 7895, distributed as follows: Graduate school of arts, literature, and science, 1420; undergraduate school of arts, literature, and science, 2904; divinity school, 263; medical courses, 213; Rush Medical College, 311; law school, 414; college of education, 71; school of commerce and administration, 260; graduate school of social service administration, 110; university college, 2281. The summer quarter enrollment for 1927 was 6380. For the year 1926-27 there were 752 faculty members who were above the rank of assistant.

The total productive endowment of the University in September, 1927, was approximately \$39,500,000, and its total resources, including funds held as agent and funds held temporarily, were in excess of \$71,000,000. The library contained 768,559 volumes and about 275,000 pamphlets. Among the gifts received during the year for new buildings were: \$665,000, from George Herbert Jones, to be used for the erection, equipment and maintenance of the George Herbert Jones Laboratory, for the department of chemistry; the sum of \$1,000,000 from Col. John Roberts, for the erection and maintenance of a hospital to be known as "The Bobs Roberts Memorial Hospital for Children," as a unit of the University's hospital and medical education plant; the sum of \$300,000 from Mrs. Gertrude Dunn Hicks, for the erection and equipment of The Gertrude Dunn Hicks Memorial, adjacent to the existing medical buildings of the University, as an orthopedic hospital in which preference is to be given as far as practical to poor children who are unable to pay for treatment received. Several gifts amounting to \$20,300 were received for the extension of the work of the Oriental Institute and its explorations. Julius Rosenwald pledged \$5000 a year for five years toward the budget of the graduate school of social service administration, in addition to which the school received pledges totaling \$11,400. Among the bequests received by the University were the following: That of John Mason Jackson, of approximately \$52,000, the income of which is to be used to aid poor and worthy students at the University; one-fifth of the residuary estate of Mrs. Mae Manford Bridge, to be used to further the work of the Norman Bridge Pathological Laboratory; the sum of about \$600,000, after the termination of certain life-interests, from Wiley S. McCrear; \$50,000 from Edward Hillman, to be known as the "Edward Hillman Fund"; the sum of \$200,000 from Mrs. George F. Porter, for the productive funds of the University. Gifts to the endowment were as follows: Frederick A. Ingalls, \$100,000 on an annuity basis, to be used for such educational purposes as the Trustees of the University may determine; Louis B. Kuppenheimer, \$250,000, the income of which is to be devoted to the study of the structure, functions and diseases of the eye, and to instruction in the department of ophthalmology. Up to Nov. 2, 1927, the University had received 137 contributions, totaling \$315,573.33, to the Frank

Billings Medical Endowment Fund, a fund which it hopes to raise to \$1,000,000.

Buildings under construction during the year involved the expenditure of about \$8,033,000, and included: The University chapel, with a seating capacity of 2000; buildings for the medical school, one of which was the Albert Merritt Billings Hospital; Wieboldt Hall, for the use of the department of modern languages and literature; and an addition to the athletic stands. The University also received assurances of funds for the erection of a building for social sciences, and a building for mathematics and astronomy. President, Max Mason, Ph.D., LL.D.

CHILD LABOR. MANUFACTURERS' PLAN. Operating on the assumption that the Child Labor Amendment had been rejected, the National Association of Manufacturers, in the fall of the year, issued a programme for the greater protection of working children of the ages of 14 and 15. The plan included the following:

(a) An employment certificate issued under State authority for each job applied for under a different employer.

(b) A physical examination by physicians designated by the State, and a certificate that the individual is physically fit to enter the employment applied for.

(c) The completion of the sixth grade, after allowing two years for adjustment after the passage of the statute in States not already having an educational qualification, with proper provision for vacation permits.

(d) The requirement of a minimum of four hours a week of continued education, either in continuation schools or under shop plans approved by properly constituted State authority which should have the power to release individuals incapable of further education or to excuse any child until proper continuation schools have been established.

(e) The limiting of the hours of labor of all children under 16 years, employed in manufacturing, mining, transportation or commercial occupations, of not to exceed 48 hours per week, with a prohibition of night work before 7 A.M. or after 9 P.M.

(f) The strengthening of laws forbidding the employment of children in hazardous occupations by more carefully defining the specific hazards.

The plan was closely examined by the proponents of the Child Labor Amendment and portions of the Manufacturers' Plan came under severe censure. The following represents a synopsis of these criticisms:

Paragraphs *a* and *b* were deemed praiseworthy. On the other hand, the plan spoke nowhere of the eight-hour day as such. It referred to a 48-hour week for children under 16 with no night work after 9 P.M., but already 31 States and the District of Columbia had eight-hour laws, while 35 States and the District of Columbia forbade night work after 5, 6, and 7 P.M. Only Idaho in the whole country had a 9 P.M. closing law, while Texas and California permitted 10 P.M. as the closing hour. The fact that factories and establishments might be open between 7 A.M. and 9 P.M., in which children were to work 8 hours daily, made the proposal generally unenforceable.

Further, the carrying out of the programme meant for retrogression in many States that had enlightened Child Labor codes. For instance, in 7 States, the manufacturers would lower the leaving age for full-time compulsory school attendance from 15 years to the fourteenth birthday and the sixth grade. They would, too, release children from all school attendance where there were no continuation schools. They would make work legal for children in mines on the fourteenth birthday and the completion of the sixth grade, whereas, in all important mining

States, the legal age for beginning work has been 16 since 1920.

However, it was agreed that the programme was a forward step as far as backward States were concerned. For example 6 States did not require employment certificates; 17 States did not require physical examinations; 19 States did not require the completion of the sixth grade; 21 States had no continuation school law; 13 States permitted more than a 48-hour week; 32 States permitted work before 7 A.M.; 5 permitted work after 9 P.M. in manufacturing and 15 permitted it in mercantile establishments. In reference to work in dangerous occupations: 28 States permitted children to work around explosives, 22 permitted them to run elevators, 35 permitted them to work on scaffolding, 17 permitted them to oil and clean machinery in motion.

Critics pointed out that it would be interesting to see if the Manufacturers' Plan was to be regarded as a minimum programme or a maximum one.

LEGISLATION. The *Connecticut* legislature passed a bill forbidding the employment of minors (under 16) after 6 P.M. on more than one day a week, and forbade their employment at any time after 10 P.M. *Illinois* amended its law to provide for the payment of an additional 50 per cent compensation to minors illegally employed. *Maine* amended its child labor code to further limit places of employment for minors. *Maryland* provided for double compensation in case of accident to illegally employed minors. *Michigan* passed a similar law. *North Carolina* passed a bill limiting, for children under 16 years who had not yet completed the 4th grade, employment to an 8-hour day, 48-hour week. The bill also prohibited the employment of children under 16 years after 7 P.M.

In certain States, existing codes were weakened. *Connecticut* passed a law to permit children between the ages of 14 to 16 to work after school hours. *Maine's* legislature decided to allow children over 14 years, of subnormal mentality, to leave school. *Michigan* permitted children engaged in canning establishments to work more than the maximum 10-hour day, 54-hour week. *Minnesota* amended its code to permit (by omission) the employment of minors in the paint industry. Also, children under 10 years may accept employment as singers, dancers, musicians or actors on a permit from the industrial commissioner. *West Virginia* amended its law to permit a parent's affidavit, in place of the birth certificate, to be accepted as proof of a minor's age.

CHILD LABOR AMENDMENT. During the sessions of the 1927 legislatures, the Child Labor Amendment was introduced into 13 such bodies. In the following States adjournment was made without any action having been taken: Colorado, Georgia, Iowa, New York, Oklahoma. In Maryland the amendment was rejected in both houses. In the following States, the amendment was rejected in one house and not introduced in the other: Tennessee, Texas, Utah, Wyoming. In Nebraska, the House rejected the bill and the Senate postponed action. In Nevada the House ratified the bill while the Senate rejected it. Montana was the only State which ratified the bill.

INTERNATIONAL SITUATION. As is known, one of the important functions of the International

Labor office, created by the Versailles Treaty, is the protection of children in industry. It is interesting to summarize here what steps had thus far been taken in this field. By the draft convention adopted at the Washington Conference in 1919, 14 was set as the entering age in manufacturing, mines and transportation, and in 1920 and 1921 seafaring, commerce, and agriculture were included. The 1919 Convention was ratified by 18 States with the result that in them the 14 years minimum was compulsory. These were: Belgium, Bulgaria, Chile, Czechoslovakia, Denmark, Estonia, Finland, Great Britain, Greece, Irish Free State, Italy, Japan, Latvia, Netherlands, Poland, Rumania, Jugoslavia, Switzerland. China and India passed similar laws, while in 9 countries legislation along the same lines was being considered. The 1921 Convention (affecting agriculture) was ratified by 11 countries; the 1920 Convention, affecting seafaring activities, was ratified by 19 countries.

The 1919 and 1921 Conventions, prohibiting nightwork in industry and agriculture for persons under 18 years between the hours of 10 P. M. and 5 A. M., was adopted by 20 countries, viz., Austria, Belgium, Bulgaria, Chile, Denmark, Estonia, Finland, France, Great Britain, Greece, Hungary, India, Irish Free State, Italy, Latvia, Netherlands, Poland, Rumania, Jugoslavia, Switzerland.

Other work accomplished by the International Labor Office was in the form of recommendations. These specifically were directed at the abolition of child labor in industries where there was danger of lead poisoning, the recommendation of periodic medical examinations, and the safeguarding of the health of minors engaged in seafaring activities.

INDUSTRIAL ACCIDENTS. An example of the inadequate precautions taken to protect children in industry was to be found in the summary of industrial accidents to minors in Illinois in 1926 (published by the Illinois Department of Labor). Of 1469, the total number of injuries reported, 89 had happened to children under 16. Of the 89, 75 lost six or more working days and of these, six were fatally injured and seven received injury causing permanent partial disability. Thirty-five of the injured children under 16 were illegally employed and under the Illinois law were not eligible to compensation. (This was changed by the law of 1927, giving such children an additional 50 per cent compensation.) The proportion of children killed was 2.5 per cent of those legally employed as compared with 8.6 per cent of those illegally employed; of those who worked legally, five per cent suffered permanent partial disability as against 11.4 per cent of those who were illegally employed. Between the ages of 16 and 17, and here the law does not apply as to hazardous occupations, there were 456 accidents, or more than five times the number occurring among children under 16 years.

FARM LABORERS. An interesting series of studies into the position of Illinois child farm laborers has been conducted by the Children's Bureau. Of 1672 children, under 16 years of age, found working in a group of districts 737 worked in the fields. Three-fifths of these were at least 12 years old; most of the children were of native parentage whose fathers were farm owners or tenants. The working day ranged from

eight to 10 hours, involved the handling of machinery and teams of horses, and, when school absences occurred, farm work was cited as the chief reason. Most of the work was done on the home farm or in the vicinity of the home. This situation is to be contrasted with that of the child laborers on truck farms near Chicago. Most of these are of foreign parentage. They are not particularly retarded at school, but their lot is unfortunate in that they travel considerable distances to their places of employment.

CHILD NUTRITION. See FOOD AND NUTRITION.

CHILD WELFARE. Credit has been given before in the YEAR BOOK to the extraordinary rôle being played by the Children's Bureau of the U. S. Department of Labor in the field of child welfare. Through the publication of its excellent *News Summary*, by special bulletins, and through the medium of field surveys, this organization serves as a clearing house for information and for the creation of proper standards in the safeguarding of the health and lives of children. The progress indicated here in child welfare surely owes as much to the activities of the Children's Bureau as it does to any other single agency.

HOME CARE. The Children's Bureau indicated that from 1911 to 1926, 42 States, Alaska, Hawaii, and the District of Columbia had on their statute books laws providing for assistance for dependent children in their own homes. This was in line with the generally accepted theory that home care for dependent children was much more desirable than orphanage care. The movement had advanced on two wings: foster-home care for children whose mothers were dead, ill, or in institutions; and home care for children whose mothers would ordinarily be the chief breadwinners. In the latter case, the State supplements the family budget to insure the mother's continuance as the chief home-maker. Apropos of foster-home care it is interesting to note that the system had been in existence in Scotland since 1800, and there were in that country no public "orphan asylums." Contrast the situation with the United States. As a result of the census of dependent children for 1923, made by the U. S. Census Bureau, it was shown that in six States the foster home was unknown; in 16 States, the amount of foster-home care was about 1 per cent; while in 10 States it was under 5 per cent. Massachusetts led the New England group with 36.5 per cent; New Jersey led the Middle Atlantic States with 28.5 per cent; Michigan led its area with 19.4 per cent foster-home placement. An interesting treatise on the theory and technique of child-placing agencies is to be found in a Children's Bureau report for 1927: *The Work of Child-Placing Agencies* by K. P. Hewins, L. J. Webster and Dr. M. L. Evans.

LEGISLATION. The following notes summarize the leading activities of the 1927 legislatures in this field:

AID TO DEPENDENT CHILDREN. The Legislature of North Carolina increased its appropriation for *mothers' pensions* from \$30,000 to \$50,000. Pennsylvania appropriated \$2,750,000 toward the same purpose. New Hampshire passed a law granting \$2.50 per month per child additionally in exceptional cases and allowing mothers to accept approved employment of not more 20 hours per week. Missouri extended the applica-

tion of its laws to all counties of less than 700,000 inhabitants. New York extended its laws to include aid to dependent children when the father is tubercular and is receiving treatment at an institution or at home. Oregon went further and included mothers whose husbands are inmates of county prisons and federal jails; as well as inmates of State institutions heretofore provided for. Some legislatures considered bills for shortening the residence requirements, these being Illinois, Michigan, Ohio. New York authorized children's courts in *non-support cases* to require a bond for the performance of court orders. Oregon included abandonment in its non-support law. Iowa, Minnesota, and South Dakota amended existing *adoption* codes. Vermont made it compulsory on the probate courts to investigate conditions attending adoptions. Delaware and Maine passed laws declaring mothers and fathers equal guardians of minor children. Vermont, Texas and Washington amended their laws of guardianship. Bills relating to status of *illegitimate* children failed of passage in Wyoming, Maine and New York.

The California legislature passed a bill bearing on the status of *crippled* children. This called for the registration of cripples, the establishment of free diagnostic clinics and free medical services. New York extended its present statute to apply to cripples up to 21 years. Michigan did similarly. Missouri passed a bill of the same character as California. With respect to *tubercular* children: Massachusetts authorized its counties to provide preventorium and sanatoria; California authorized school districts to maintain special classes for tubercular children in vocational training; Minnesota passed a law similar to Massachusetts'. With respect to *deaf and blind* children: Indiana, California, Iowa, and Nebraska passed laws calling for the establishment of special classes or schools for children thus handicapped. New Jersey passed a law calling for the employment of school nurses. Arizona created a department of physical education in its schools.

With respect to *mental defectives*: Arizona's legislature provided for the creation of a State colony for mental defectives. Nebraska provided for more land for its institution. Measures to amplify the facilities of institutions now existing died in the legislatures of Indiana, Pennsylvania, South Dakota, and Washington.

With respect to *sterilization of mental defectives*: Indiana passed a law authorizing that inmates in State and county institutions for insane, feeble-minded, and epileptic persons be sterilized. Colorado's governor vetoed a similar bill while in the legislatures of Minnesota, Pennsylvania, Vermont, and Iowa, similar bills failed of action.

Pennsylvania raised the minimum age of *marriage* to 16 years. Minnesota raised its age limit to 16 for girls. New York called upon its marriage clerks to demand documentary proof of age where the persons were under 21; also the written consent of parents was to be required where girls were between 14 and 18, and boys between 16 and 21. Bills to increase marriage restrictions with regard to age, etc., failed of passage in Idaho, Iowa, Kansas, Maine, Minnesota, Nevada, New Hampshire, New York, North Carolina, Oregon, Pennsylvania, South Dakota, Washington, and West Virginia.

DELINQUENCY. Among the other activities ac-

complished by the 42 Legislatures meeting during the year were the following: Ohio passed a bill creating a domestic relations court with juvenile jurisdiction, for Franklin and Stark Counties. Michigan passed a bill extending the provisions of the juvenile court law to wayward minors 17 to 21 years old. Nevada passed a bill for excluding minors from criminal trials unless they were on trial or appearing as witnesses. Arizona passed a bill for the establishment of a State school for delinquent girls. Missouri passed a bill reserving the Missouri reformatory for boys under 21 years. In New Hampshire a bill was passed for the construction of a girls' cottage at the State industrial school. In Texas, a bill was passed for the admission of all male delinquents under 17 to the State training school (this had special application to negroes). Iowa passed a bill making five years' imprisonment the minimum punishment for rape.

Great Britain. In this country an important document bearing on the legal status of juvenile delinquency was issued by a committee appointed by the Home Secretary after a two years' survey. The *News Summary* of the Children's Bureau reviewed the recommendations in this fashion: The simplification of procedure in the juvenile court to remove the characteristic court atmosphere; greater powers of guardianship vested in the court; greater coöperation with local educational authorities. The raising of the maximum age from 16 to 17 years. Between 16 and 17, the court should have power to commit to Home Office schools or to training institutions. Imprisonment for persons between 16 and 17 should be abolished; where imprisonment, between the ages of 17 and 21, is made the court is to certify that the offender cannot be dealt with in any other way. For persons under 18, the abolition of capital punishment is recommended. The strengthening of the probation service is considered, as are institutional and after-care methods. There is also recommended the establishment of observation centres for offenders under 21, whether dealt with by the juvenile or the adult courts. Finally, a group of recommendations aims at the further protection of neglected children by local school authorities and the juvenile court.

CHILD-CARE STATUTES. In 1925, a commission, appointed by Pennsylvania's legislature for the study and revision of the State's statutes pertaining to children, issued its first report. As a result, changes were made in the procedure in adoption and in the licensing of boarding homes. In 1927, a further report was presented. This recommended the following legislation: (1) further changes of the adoption code; (2) an act repealing the laws relating to the indenture of children; (3) an act regulating child placement, placing supervision under the department of welfare, requiring that records be kept, and outlining the standards of supervision of children placed out; (4) an act prohibiting the placement of children for hire; (5) an act calling for the licensing of maternity homes; (6) an act for the purpose of taking dependent children out of the Juvenile Court's jurisdiction.

VIRGINIA'S STERILIZATION LAW. On May 2, Mr. Justice Holmes of the U. S. Supreme Court handed down a decision upholding the constitutionality of Virginia's sterilization law. Only Mr. Justice Butler dissented. This was

the first attempt to test the legality of the laws, existing in 1927 in 15 States, which give to State authorities the right to sterilize incurable mental defectives to prevent the reproduction of their own kind. It is interesting to note Mr. Justice Holmes' observations in approving the Virginia law. He said: "The provisions of the Virginia act include requirements for public hearings, reduction of all evidence to writing, appeal to the Circuit Court of the county, and finally appeal to the highest court of the State. There can be no doubt that, so far as procedure is concerned, the rights of the patients are most carefully considered, and as every step is. This case was taken in scrupulous compliance with the statute and after months of observation; there is no doubt that in that respect the plaintiff in error has had due process of law. It is better for all the world if, instead of waiting to execute degenerate offspring for crime, society can prevent those who are manifestly unfit from continuing their kind."

It had been obvious to social statisticians that institutionalized feeble-minded persons were on the increase. The United States government census of 1926 showed their number to be 39.3 per 100,000 population as against 22.5 per 100,000 in 1910. These statistics do not necessarily indicate an increase in the problem; they merely show that institutionalization has increased. Sterilization, too, had its opponents. Objections were raised on: (1) humane grounds; (2) religious grounds; (3) that feeble-minded persons were not necessarily dangerous or useless members of society; (4) there was nothing to indicate that the offspring of feeble-minded persons may not be normal; (5) that feeble-mindedness as a diagnosis was not necessarily exact.

INFANT MORTALITY. The *Statistical Bulletin* of the Metropolitan Life Insurance Co. continued its excellent work of publishing death figures affecting its large group of industrial policy holders. The following figures of mortality from children's diseases showed for the year 1926 a general decrease all along the line; the scarlet fever rate was 3.4 per 100,000 population (same for 1925); diarrheal diseases had a rate of 10.5; diseases of pregnancy and childbirth had a rate of 15.6 (16.9 in 1925); puerperal septicemia and puerperal albuminuria fell to their lowest points thus far; diphtheria had a rate of 9.5, its lowest since the decline beginning in 1921. Measles, however, showed a rate of 8.0 per 100,000 (about three times the 1925 rate); while there was a 40 per cent increase in the whooping cough death rate.

SUICIDES. Despite the prominence given to suicides among young boys and girls by the press, figures published by the statistical office of the Metropolitan Life Insurance Co. indicated that suicides among children constitute but a small proportion of the total annually taking place. Among the 2,000,000 white minors insured by the Metropolitan Life the trend of suicide appeared to be downward. For boys between 15 and 20 years the rate was 3.9 per 100,000 in 1926 as compared with 6.7 in 1911 while the rate for girls was 3.4 as compared with 10.1 in 1911.

COORDINATION OF WELFARE WORK. Many cities in the United States long since had followed the example of Cleveland in creating a single Children's Bureau for the treatment of the prob-

lem of child dependency as a unit. The Jewish Welfare Workers had done similarly with the result that by 1927 all community resources were brought into play when a dependent child was committed for care to one of these central bureaus. The Federal Children's Bureau made public an important survey of the work of the Cleveland Children's Bureau in order to give a detailed answer to the question: Why child dependency? For it is well known now that dependent children are, in the majority of cases, neither orphans nor half orphans. In Cleveland, it was found that the greatest causes of dependency were illness, physical or mental disability, death, desertion, neglect, separation and divorce, poverty, immorality and intemperance of the parents, and delinquency or special problems in the children. Another important point proved by the investigation was that the rehabilitation of the home is very often possible. It was found in Cleveland, as a result of the use of community resources, that in 1927 there were vacancies in nearly all the child-caring institutions, that two of the institutions had already been closed down, and that it was possible to place out in foster homes all children committed. It is interesting to quote this summary of the work accomplished by the Cleveland Bureau as set forth in the Federal report: "It is of particular importance that under the Bureau's guidance the institutions are acquiring a new value in the scheme of child welfare; special needs are being met by the development of special service; and the realization has gradually come that dependency alone should not be the basis of child care; that it is no longer a question of sheltering great numbers of children to the glory of the institution, but rather of the individual care the institution may give the child to the glory of the child himself."

FAMILY ENDOWMENTS. From various quarters of the globe came information to show government preoccupation with attempts to supplement wages of working families with children. Early in the year *Spain* issued a royal decree providing for government aid for large families. A family with eight children is to receive 100 pesetas annually (about \$17). Working people having more than 10 children are to be exempt from taxes on movable property and their children are to receive free tuition in the government schools. In *New Zealand* an act was passed for the paying of a State subsidy of 2s. per week for each child in excess of two, up to the age of 15 years, where the family income is not more than £4 weekly. *New South Wales* passed a somewhat similar law. After the determination of a basic wage, an endowment of 5s. weekly is to be paid for each child of 14 and under, where the family's income did not exceed the basic wage. The cost of the measure will be in the neighborhood of £4,000,000, employers being taxed, on the basis of their payrolls, to meet it.

FRANCE. Figures published for 1926 show that in France the excess of births over deaths was only 13 per 10,000 population. This was due largely to the decreased birth rate and the increased mortality, and particularly infant mortality rates. The French infant mortality rate was 97 per 1000 live births as compared with 75 in England (1925), 49 in the Netherlands (1925), 80 in Denmark (1925), 55 in

Sweden (1925). Germany, Spain, and Hungary had higher infant mortality rates, showing for 1925, 105, 136 and 167 respectively. However, these figures were lower than those for 1924 while French figures for 1924 and 1925 were 85 and 89 respectively.

BRAZIL. The government of Brazil set up a minors' code consolidating all the existing child-welfare laws on the statute books. Some of the more important laws incorporated were: a maximum six-hour day for employed minors under 18; persons between 12 and 14 years may work on completion of a primary school education; nightwork is prohibited for children under 18; no boy under 14 or unmarried woman under 18 may be engaged in any street work. Further, the laws call for public supervision of infants placed out in foster homes and provide for State supervision of children placed under the care of individuals, institutions, or associations. Further, they provide for commitment to training school of minors under 18 years charged with vagrancy and for the care of delinquents under 18.

CHILE, ché'la. A South American republic lying on the western Pacific coast of the southern part of the continent, extending from Peru to the southernmost point. Capital, Santiago.

AREA AND POPULATION. The extreme length of Chile is 2828 miles and the average width is 177 miles; area 290,084 square miles. At the census of 1920 the population was 3,753,799. The republic is divided into 23 provinces, subdivided into 82 departments and one territory (Magallanes). The populations of the principal cities, according to the census of 1920 were: Santiago, 507,296; Valparaíso, 182,242; Concepción, 64,074; Antofagasta, 51,531; Iquique, 37,421; Talca, 36,079. The urban population made up 46.6 per cent of the total. The great majority of the population are of European descent. In 1920 the foreigners numbered 115,763, as against 134,524 in 1917. The natives comprise the Fuegians, for the most part nomadic and living in the southern territories; the Changos, civilized and employed as laborers, in the coast region; and the Araucans, who live in the valleys and on the western slopes of the Andes and number about 101,118. The movement of population in 1925 was: Births, 159,017; deaths, 116,943; marriages, 28,862. On Oct. 1, 1926, the population was estimated at 3,963,462. Immigration is small but is encouraged by the government.

EDUCATION. Elementary education is free and compulsory. According to the latest available statistics there were 3357 public schools with 438,781 pupils and 9414 teachers. The Government Bureau of Primary Education reported for April, 1927, the highest registration and average attendance so far recorded for Chilean primary schools, i.e. a registration of 429,114 pupils and an average attendance of 344,527. There were also 459 private primary schools with 1430 teachers and 62,099 pupils; 15 public normal schools with 2507 pupils and 453 teachers; 96 public and 102 private secondary schools with 40,084 and 20,536 pupils and 2038 and 1247 teachers, respectively; 11 public commercial schools with 181 teachers and 3133 pupils. There are various schools of mines, professional schools, and other special institutions. For higher education there are the University of Chile, belonging to the state; the Catholic University, and two industrial universities, situated at Val-

paraíso and Concepción. Other noteworthy institutions are the Pedagogical Institute, the National Conservatory of Music, the National Observatory, etc. There are in addition various lyceums and colleges maintained in the provinces.

PRODUCTION, MINERALS, ETC. Agriculture and mining are the chief pursuits of the country. The agricultural zone lies in the centre of the country, the climate permitting the raising of tropical products as well as those of the temperate zone. Cereals are the leading crops and wheat is the most important. The acreage and production in metric quintals of the principal crops in 1926 were as follows: Wheat, 1,501,806 acres, 16,142,420 quintals; barley, 126,096 acres, 2,239,826 quintals; oats, 92,348 acres, 1,564,964 quintals; maize, 50,359 acres, 543,200 quintals; beans, 90,009 acres, 702,124 quintals; peas, 2823 acres, 21,940 quintals; potatoes, 68,074 acres, 270,890 tons; vines, 171,480 acres, 33,249,018 gallons of wine. Fruit growing has latterly increased and covers an area of approximately 20,000 hectares. On Jan. 1, 1926, the livestock comprised 323,581 horses, 27,364 asses, 40,187 mules, 1,918,433 cattle, 4,093,872 sheep, 357,033 goats, and 246,636 pigs.

Chile is very richly endowed with minerals. She is the second largest producer of copper in the world, the output in 1925 being 189,319,000 kilos (417,379,000 pounds). Other important minerals are gold, silver, cobalt, manganese, coal (1,440,425 tons in 1925), nitrate, borate, salt, sulphur, guano, and iron ore. The iron resources had not been developed to any great extent but were reported to be very rich. The deposits are in the provinces of Atacama and Coquimbo. The coal region lies to the south of Valparaíso.

By far the most important item of commerce is nitrate of soda, which is found chiefly in the nitrate section of the desert of Atacama. According to the U. S. Bureau of Foreign and Domestic Commerce, the annual message of the president of the Chilean Nitrate Producers' Association on Sept. 29, 1927, contained many interesting comments regarding the conditions which affected the sales of nitrate during recent years, and again urged the need of a substantial reduction in export duties if Chile was to maintain a fair share of the overseas market. Reviewing the statistical position of the industry, the president pointed out that Chilean production of nitrate during the 12 months ended June 30, 1927, reached 1,301,968 metric tons, approximately 50 per cent below that of the preceding year. Exports totaled 703,555 metric tons, or approximately 33 per cent less than in 1925-26. Sales of 1,023,108 metric tons were approximately 47 per cent below those of 1925-26, and consumption, amounting to 344,424 metric tons, was about 16 per cent less. Faced with the increasing competition from synthetic fertilizers, the association recognized the necessity of developing and promoting the consumption of Chilean nitrates. During 1925-26, £381,031 were expended for this purpose and for the year 1927-28 there has been budgeted the sum of £368,105.

For the latest study of Chilean manufacturing industries consult the preceding YEAR BOOK.

COMMERCE. The following table from the Pan American Bulletin gives the Chilean foreign trade in mining products during 1926:

CHILEAN FOREIGN TRADE IN MINING
PRODUCTS, 1926

<i>Imports</i>	<i>Amount</i>	<i>Value Pesos</i>
Iron wirekilos..	10,283,390	5,589,431
Benzinedo..	19,279,553	6,043,094
Coketons..	33,410	1,693,509
Coaldo..	105,811	5,945,514

Nitratemetric quintals	14,528,354	621,962,482
Iodinekilos..	1,075,319	90,678,796

Chile, one of the most progressive countries of South America, has long been an important market for American products. In 1913 the United States ranked third among suppliers of the Chilean market. Since that time however, the United States has superseded both Germany and Great Britain, and, although competition was keen, it had been able to maintain the supremacy gained during the World War. The prosperity and well-being of Chilean commerce fluctuates directly with the condition of a single industry, the production of nitrate of soda. The relation between Chile's imports and exports of nitrate and iodine (a by-product of the nitrate fields) is indicated below.

VALUE OF CHILEAN IMPORTS IN RELATION TO
VALUATION OF EXPORTS OF IODINE AND
NITRATE
[In United States currency]

<i>Year</i>	<i>Total imports</i>	<i>Exports of iodine and nitrate</i>
1922.....	\$86,570,800	\$64,507,250
1923.....	120,198,400	117,900,750
1924.....	182,589,000	123,701,300
1925.....	148,843,800	184,878,500

According to statistics compiled by the Pan American Union, the value of Chile's foreign trade in 1926, expressed in United States currency, totaled \$358,575,580, as compared with \$377,426,497 in the previous year, being a decline of \$18,850,917, or 4.99 per cent. Imports to the value of \$157,274,448 showed an increase of \$8,430,152, or 5.66 per cent over 1925, while exports valued at \$201,301,132 represented a decrease of \$27,281,039, or 11.93 per cent. The export figure includes reexports. Lower production and exportation of nitrate caused the decline in exports.

Of the total imports the United Kingdom supplied \$27,069,517; France, \$6,554,944; Germany, \$19,088,067; and the United States, \$51,386,535. Among the leading imports in 1926 were: Iron and steel bars, plates, and manufactured articles, \$21,962,563; cotton textiles, \$13,678,261; mineral oils, \$8,863,090; bags, \$8,232,620; sugar,

\$7,621,650; livestock, \$7,100,838; electrical machinery and apparatus, \$6,793,299; woolen fabrics, \$5,433,940; edible oils, \$2,210,341; rice, \$2,052,769; tea, \$1,819,509; newsprint paper, \$1,809,358; chemical products, \$1,645,059; locomotives, \$1,352,109; and passenger automobiles, \$1,218,383.

The share of the United Kingdom in Chile's export trade amounted to \$52,139,031; of France \$7,594,396; of Germany, \$12,040,441; and of the United States, \$96,905,476. The leading exports were: Nitrate, \$86,423,113; bar copper, \$47,044,437; gold in bars, \$23,064,379; iodine, \$11,569,651; wool, \$4,648,729; barley, \$3,799,737; borax, \$2,513,420; oats, \$2,419,526; wheat, \$1,846,628; copper ore, \$1,802,838; frozen meat, \$1,682,033; iron ore, \$1,444,169; and wheat flour, \$996,102.

FINANCE. The average annual increase in expenditures during recent years will be seen from the following table:

EXPENDITURES IN RECENT CHILEAN BUDGETS

<i>Year</i>	<i>Estimated budget expenses Pesos</i>	<i>Percentage variation from pre- ceding budget</i>
1923.....	672,140,000	+ 11
1924.....	637,904,000	- 5
1925.....	707,729,000	+ 11
1926.....	958,824,000	+ 36
1927.....	998,059,000	+ 4

Each of these years resulted in a heavy deficit for the country. In 1926, for instance, budgeted expenditures reached 1,038,000,000 pesos, whereas actual income only amounted to 822,000,000, leaving a deficit of 216,000,000 pesos. By applying against this amount 115,000,000 pesos received from the proceeds of the Kissel-Kinnicut loan, the year's deficit was reduced to 101,000,000 pesos. During 1927 an at-

CHILEAN GOVERNMENT RECEIPTS AND
EXPENDITURES, 1927
[Estimated]

<i>Receipts, in pesos</i>	
Ordinary revenues:	
(a) National property	18,290,018.92
(b) National services	102,659,859.25
(c) Direct and indirect taxes	709,872,161.04
(d) Various revenues	124,758,126.42
Total	955,574,665.63
Revenues from special laws, devoted to par- ticular objects:	
Plans and construction of sewer systems	8,585,000
Dredging of the Ma- pocho River	2,000,000
Port works	26,900,000
Total	37,485,000.00
Grand total	998,059,665.63

<i>Expenditures, in pesos</i>	
Interior	183,796,415.28
Foreign relations	9,226,889.31
Justice	28,669,774.78
Public instruction	141,887,605.81
Treasury	298,290,274.94
War	115,228,669.98
Navy	97,053,786.21
Agriculture and industry	14,470,908.00
Lands and colonisation	1,980,865.80
Public works, commerce, and communi- cations	126,581,267.90
Hygiene and public charity	24,659,915.62
Social welfare and labor	1,718,292.00
Total expenditures	998,059,665.63

tempt was made to return to a fair average increase, no matter what the outcome may be. According to information in the press of Santiago the accompanying table (page 191) shows the estimated gross receipts and expenditures of the government for the year.

As regards the 1928 budget the Minister of Finance gave the following as the Budget Office's estimates of the probable revenues after correcting obvious errors in the 1927 year's estimates:

ESTIMATED CHILEAN REVENUES FOR 1928

Item	1927 budget Thousand pesos	1928 proposed budget Thousand pesos
National properties	18,290	2,450
National services	102,659	109,711
Direct and indirect taxes:		
Nitrate	171,400
Import duties	215,000
Income	167,500
Seals, stamps, etc.	35,300
Consular duties, etc.	27,000
Other	93,672

COMMUNICATIONS. The total length of government owned railways in Chile in 1927, was 4683 kilometers; capital expenditure, 862,903,000 pesos; receipts, 239,168,000 pesos; expenditures, 197,678,000 pesos; interest payments, 22,704,000 pesos. The Minister of Public Works in Santiago announced during the year 1927 that 9,000,000 pesos had been allotted in the current appropriations for the construction of branches and sidings on the Iquique-Pintados branch of the Longitudinal Railway of Chile, and for the purchase of necessary rolling stock and equipment for its operation. According to the Minister's decree, the 9,000,000 pesos will be expended for the following purposes: (a) To complete branches to the nitrate plants, Brac, Pan de Azucar, Diez de Septiembre, and Santa Lucia, 430,000 pesos; (b) for the construction of a branch line to Pampas Pissis and Nebraska, 2,250,000 pesos; (c) for the purchase and repair of rolling stock, 4,232,000 pesos; (d) for construction of a power plant for the operation of repair shops, 500,000 pesos; (e) to begin construction of repair shops, 1,000,000 pesos; (f) to begin construction of homes for workmen and for strengthening the railway mole, 250,000 pesos; and (g) for expenses of administration and miscellaneous, 338,000 pesos.

At the suggestion of Admiral Swett, when Minister of Marine, an assembly of interested persons was convoked for Merchant Marine Week in Valparaiso the last of March, in order to bring out public opinion on the needs of the national merchant marine. Among other matters, the conference favored the continued reservation of coastwise trade to Chilean shipping, the repeal of certain taxes, and the passing of a law subsidizing national naval construction and navigation. In the closing address, Captain Frodden, Minister of Marine, promised his support to the first two of these measures, but said that he thought the consideration of subsidies would have to be postponed until financial conditions should have improved. The shipping

entered and cleared at the ports of Chile in foreign trade in 1925 was as follows: Entered, 1245 vessels of 3,348,338 tons; cleared, 1191 vessels of 3,247,319 tons. In the coastal trade, 17,446 vessels of 15,924,478 tons entered, and 18,512 of 19,177,121 net tons cleared.

GOVERNMENT. According to the constitution of Oct. 18, 1925, legislative power is vested in the National Congress, consisting of a senate of 45 members and a house of representatives of 132 members. The executive power is vested in the president who is elected for six years, and who is not eligible to succeed himself. The president is assisted by a cabinet, which is responsible to him, and the members of which may speak in congress but may not vote. President in 1927, Col. Carlos Ibáñez.

HISTORY. Col. Carlos Ibáñez, actual executive of Chile, with the rank of vice-president at the time of the election, was elected by an overwhelming majority of the 300,000 votes cast at the elections in May. As noted in the preceding YEAR BOOK, Colonel Ibáñez had a brief but active career as premier, and, after President Figueroa-Larrain's request for a two months' leave of absence, he was appointed vice president. Shortly afterward the president requested to be relieved of office, whereupon Colonel Ibáñez signed a decree authorizing elections to fill the vacant presidential chair, announcing at the same time his own candidacy for that office. In a statement to the press, immediately after his election, the new president said, "I am profoundly grateful to my fellow countrymen, who in such generous fashion have expressed their desire that I continue to head the campaign for the moral, economic, and social betterment of Chile."

The new president was born some 45 years previously in the city of Linares, one of the numerous rural communities scattered along the line of the great Central Valley which constitutes the backbone of the national life of the Chilean republic. His family, which traced its descent directly back to the original settlers of the country, possessed one of the large fortunes of the country, but time and the ever-increasing number of new branches had left little more than the memory of former affluence. Shortly after his graduation from the National Military Academy in Santiago in 1903, Captain Ibáñez was assigned to serve as instructor in the republic of Salvador. Upon his return to Chile in 1909, Captain Ibáñez again took his place as a cavalry officer in the regiment of Cazadores. Two years later he entered the War Academy, the finishing school for the officers of the Chilean army. Later still he passed some time with the garrison at Tacna, going afterward to Iquique as commissioner of police. In 1924 he was back again at Santiago, where he became one of the guiding forces of the political upheaval of that year. Afterwards he became a leading force in the Government of Chile, first as minister of war, later as prime minister, and still later as vice president. The Ibáñez government appointed Señor Don Carlos Davila ambassador extraordinary and minister plenipotentiary to the United States to succeed Dr. Miguel Cruchaga Tocornal. The new ambassador was received by President Coolidge on October 6.

An important historical event was the signing, February 24, of a treaty between Chile

and Italy. So many treaties in history have provided for offensive or defensive war that this one, of which the sole purpose was peace, deserves to be signaled. Inspired by "the desire of the two countries to strengthen the bonds of friendship which unite them and increase the cordiality of their relations," it established a procedure for the peaceful settlement of any disagreement which may arise between them. A permanent arbitration commission, to consist of five members, of whom three shall not be citizens of the contracting powers, is to be appointed. Should the findings of this commission, on any dispute which may arise not be accepted by either of the powers concerned, the dispute is to be referred to the Permanent Court of International Justice at the Hague, whose decision shall be executed in good faith. It is provided that the treaty, which is of 10 years' duration, shall in no way affect the rights and obligations of the contracting powers as members of the League of Nations. Since this was the first treaty which Italy had concluded with any trans-Atlantic power, it excited great interest in that country. Don Enrique Villegas, Chilean ambassador at Rome, has stated that he believed it to be the first of a series of treaties between Italy and the Latin American states and between Chile and the great powers of the world.

For a discussion of the Tacna-Arica dispute, consult the article on **ARBITRATION, INTERNATIONAL**.

CREATION OF NATIONAL BUDGET OFFICE. A decree of the Minister of the Treasury of Chile created a national budget office on Aug. 24, 1927. In addition to setting forth the functions of the office and defining its powers, the decree provides for a separate appropriation in the annual budget for its maintenance and fixes its personnel. It is intended that the budget office shall be a separate entity, reporting directly to the President when the reorganization of the government is completed.

Among the most important functions of the budget office are the preparation of estimates of fiscal receipts, the formulation of a budget of expenditures, and requisite adjustment subject to presidential approval. The budget office is also charged with the establishment of well-defined standards for the preparation of the extraordinary and special budgets, the classification of budget receipts and expenditures, and the collection of pertinent data on the national and foreign budgets. The printing and distribution of the national budget law are other functions of the budget office.

The Director of the Budget will be empowered to propose personnel nominations of the budget office to the President, and to make any expenditures necessary for the opportune preparation, printing, and distribution of the budget. When considered necessary, he will have the power to visit any office of the Government and solicit necessary data for the preparation of the budget of receipts and expenditures.

The Director of the Budget will also be empowered to designate, in agreement with the ministers charged with the preparation of the budget in their departments, special commissions to investigate possible economies in public service which are compatible with the nature of the service and meet with legal and administrative requirements. The budget director will

also be empowered to propose to the President regulations governing the application of the organic budget law.

CHILE NITRATE. See **FERTILIZERS**.

CHINA. A Far Eastern State forming the eastern part of Asia, on the Pacific Ocean, under a republican form of government after Feb. 2, 1912.

AREA AND POPULATION. China comprises 18 provinces, the so-called dominion of Sinkiang, the dependencies of Manchuria, Fengtien, Kirin, and Heilungkiang, and the regions over which only nominal authority exists, viz., Mongolia and Tibet. Since China has not yet carried out a proper land survey or census, the area and population of its territory can be given only as estimates, as in the following table (figures for certain other countries are added for purposes of comparison):

Regions	Area in square miles	Population	
		Total	Density per square mile
China proper, including the three Manchurian Provinces	1,897,000	486,000,000	238
Mongolia	1,370,000	2,500,000	2
Chinese Turkestan ..	550,000	1,200,000	2
Tibet	465,000	6,500,000	14
Total, Chinese territory	4,282,000	446,200,000	104
South America	6,850,000	60,000,000	8
United States, exclusive of dependencies	3,620,000	110,000,000	30
Japanese Empire ..	280,000	80,000,000	307
France (continental)	207,000	40,000,000	160

The population of the Great Yangtze Basin is estimated at 200,000,000. The Yangtze Delta, comprising an area of 50,000 square miles, or about that of the State of Illinois, has an estimated population of 40,000,000. Two-thirds of China's population is concentrated in one-third of its area, being densest along rivers and in coastal regions. Mongolia, Turkestan, and the three Manchurian Provinces offer vast areas of fertile lands for settlement and mineral resources for development, but lack of adequate means of transportation and protection against brigandage have discouraged settlement of these sections. The accompanying table (page 194) gives certain essential data concerning the Provinces of China:

The figures pertaining to area and population as given in the foregoing table are taken from the Chinese Post Office estimates of 1922. Where these figures are given otherwise in this book, the reader is at liberty to make his own choice—for China has as yet taken no official census.

There are similar divergences in the estimates of the population of the cities. According to the government estimate of 1921, the population of Peking and its suburbs was about 1,300,000. Another estimate places it at 924,334, including 4000 foreigners. The estimates for the chief Chinese ports in 1925 given out by the Chinese Maritime Customs were as follows: Shanghai, 1,500,000; Hankow, 1,646,800; Canton, 900,000; Hangchow, 340,200; Changsha, 535,800; and Soochow, 500,000. The total number of foreigners and foreign residents in China in 1925 accord-

POPULATION AND AREA OF CHINA, BY PROVINCES

Province	Area in square miles	Population according to Chinese Post Office estimate, 1922	Capital of Province
Anhui	54,826	19,850,000	Anking
Chekiang	36,680	22,000,000	Hangchow
Chihli	115,830	34,200,000	Paoingfu
Fukien	46,332	13,200,000	Foochow
Honan	67,954	30,850,000	Kaifeng
Hunan	83,398	28,450,000	Changsha
Hupeh	71,428	27,150,000	Wuchang
Kansu	125,488	6,000,000	Lanchowfu
Kiangsi	69,498	24,500,000	Nanchang
Kiangsu	38,610	38,800,000	Nanking
Kwangsi	77,220	12,250,000	Kweilin
Kwangtung	100,000	37,150,000	Canton
Kweichow	67,182	11,100,000	Kweiyang
Shansi	81,858	11,000,000	Taiyuanfu
Shantung	55,984	30,800,000	Tsinan
Shensi	75,290	9,450,000	Sianfu
Szechwan	218,538	49,800,000	Chengtu
Yunnan	146,714	9,850,000	Yunnanfu
Shengking (Manchuria)	363,700	22,100,000	Mukden
Kirin (Manchuria)			Kirin
Heilungkiang (Manchuria)			Tsitsihar
Total ...	1,896,515	433,500,000	
Sinkiang ...	550,000	2,500,000	Urga
Mongolia ...	1,370,000	2,500,000	Lhasa
Tibet (Chinese estimate) ..	465,000	6,500,000	
Grand total	4,282,000	445,000,000	

ing to the Chinese Customs authorities was 336,841, of whom 213,351 were Japanese, Russians, 79,785, British, 15,247, Americans, 9844, Portuguese, 3739, Germans, 3050, and French, 2576. The treaty powers in China down to the beginning of 1927 were as follows: Russia, Great Britain, United States, France, Norway, Sweden, Denmark, Netherlands, Spain, Belgium, Italy, Peru, Brazil, Portugal, Japan, Mexico, Chile, Switzerland, Bolivia, Persia, and Japan. Of these powers, Germany, Bolivia, Persia, and Chile have renounced the consular power.

EDUCATION AND RELIGION. There are two kinds of primary schools in China, the higher and the lower. The former are established by district governments and are intended as intermediate schools between the lower primary schools and the middle schools. According to the latest available statistics the total number was 10,236 with 582,579 pupils. At the same time there were 167,076 lower primary schools with 5,814,375 pupils. At the beginning of 1927 there were 10 government universities. Tsing Hua College, a special institution, was established near Peking, to prepare students for education in the United States, under the agreement on the part of the United States to return the Boxer indemnity for that purpose. There is a modern university for Chinese under British direction at Hong Kong which is attended by students from many parts of China.

There are three forms of native religion, Confucianism, Buddhism, and Taoism. Besides these there are Mohammedans in all the provinces, whose numbers have been estimated at 5,000,000 to 10,000,000. Roman Catholicism at the end of 1923 maintained 57 bishops, 1481 European priests, and the native Roman Catholics numbered 2,208,800. The Protestant missions in

1920 had 6636 engaged in their service and the Chinese Protestants numbered 618,601.

ECONOMIC CONDITIONS, PRODUCTION, ETC. The U. S. Bureau of Foreign and Domestic Commerce reported in November, 1927, that although China for several years past had been in a state of political disruption, which had seriously reacted on its economic and commercial activities, yet many foreign observers claimed to perceive beneath the disorders evidences of the growth of a new China. The great outstanding feature apparent was the gradual development of a spirit of nationalism which reaches beyond political lines and seems to offer promise of a homogeneity which the Chinese have never yet experienced. The Chinese as a people striving for normal development were, however, suffering from severe handicaps, some of which can only be overcome by time.

Widespread education, all the way from elementary forms to technical training, and a more complete system of communication and transportation are probably the two greatest needs of aspiring China. More than 80 per cent of the people are illiterate. About the same portion constitutes the agricultural masses, who, for the most part, live in the direst poverty. Industries are still very largely in the cottage and hearth-side stage of development that characterized industrial Europe in the Middle Ages. There are also a great number of dialects which are not understandable as between people of one province and another, hence customs and opinions are divided along provincial lines. The family is the social unit, and the clan, rather than the community or the State, calls for the individual's allegiance. Concentration over many centuries on obligations to ancestors rather than to the political entity has served to retard the development of any sort of civic spirit.

China's internal communication lines are, with the exception of a few thousand miles of railroad and a few hundred miles of recently built highroads, almost as primitive as they were in the time of Confucius. Other handicaps at the present time are the demoralizing effect of overissues of unsecured paper money by military war lords, and the presence in the country of upward of a million armed men, comprising in part armies of brigand soldiers.

China and the United States lie between approximately the same degrees of latitude and are surprisingly similar physically. Each is possessed of a huge central river valley which constitutes the backbone of its agriculturally productive area. Each is possessed of a remarkable range of mineral resources, but the mineral resources of the United States are in course of adequate development, while China's are almost untouched. In area China is larger than the United States, and has nearly four times its population. This vast total of over 400,000,000 people, however, is spread very irregularly over the country, six-sevenths of its inhabitants being concentrated in one-third of its area. Striking indices of the differences in development between the two countries are the per capita ratio of iron and steel production and the per capita use of industrial machinery. China's per capita iron and steel production is one one-hundred-and-eightieth of that of the United States. In the United States every man, woman, and child has on the average 25 mechanical services, compared with an estimate of three-

fourths of one for each Chinese. An interesting contrast in the economic development of the two countries is afforded by the accompanying summary, showing some forms of their industrial equipment and productivity.

Of China's immense population at least 80 per cent is agricultural. Among the principal crops of China are wheat, barley, corn, millet and other cereals, peas, beans, rice, sugar, indigo, cotton, silk, tea, and a great variety of fruits. The social and economic life of the nation is so definitely associated with agriculture that, the Chinese themselves say, all the inroads of modernism and the industrialization of the larger cities have made hardly an impress upon the general condition of the people. Gen. Chiang Kai-shek, the leader of the Nationalist forces, said in a recent speech that "out of the 400,000,000 Chinese, 360,000,000 are farmers and laborers. The rest are merchants and students."

One prime factor, a fundamental value in any estimate of China as a potential market, has ever eluded the investigator—that of the purchasing capacity of the masses. So many mouths to feed, so many bodies to clothe, so many hands to fill with tools; but how much to buy with? A recent survey of 150 farms, conducted by Nanking University, however, serves to throw a good deal of light upon what has been hitherto a very obscure subject. The 150 farms were located in one of the most prosperous regions of Central China, and while it is realized that the area surveyed comprises but a very small part of China's agricultural total—with conditions

	<i>Silver dollars</i>
Farm receipts:	
Crop sales	81.50
Animal products sold	4.06
Other cash receipts	2.12
Products from the farm used by the family	70.15
Increase of capital	9.97
Total	167.80
Farm expenses:	
Hired labor (including board)	5.84
Value of family labor (unpaid)	19.14
Cash expenditures (other than hired labor)	41.19
Decrease of capital	1.47
Total	67.14

From these compilations the following interesting figures are adduced by the surveyors:

	<i>Silver dollars</i>
Farm earnings (farm receipts minus farm expenses)	100.66
Interest on capital (\$762.38 at 8 per cent) ..	60.99
Labor earnings (farm earnings minus interest on capital)	39.67
Labor income (labor earnings minus value of farm products used by the family)	30.48
Income from other than farm sources	15.83
Family income (crop sales plus animal products sold plus other cash receipts plus income from other than farm sources minus cost of hired labor plus other cash expenditures)	56.48
Family earnings (farm receipts plus income from other sources minus all farm expenses except value of family labor)	185.13
Per cent return on capital invested (farm earnings minus value of operator's labor divided by average capital)	9.8

STATISTICS SHOWING THE COMPARATIVE ECONOMIC DEVELOPMENT OF THE UNITED STATES AND CHINA

<i>Item</i>	<i>United States</i>	<i>China</i>

Children in public schools	26,000,000	7,000,000
Foreign trade, annual	9,000,000,000	1,300,000,000
Per-capita foreign trade	80	8
Wheat production, annual	800,000,000	300,000,000*
Rice production, annual	34,000,000	800,000,000*
Peanut production, annual	350,000	900,000

* Estimated.

in North and West China undoubtedly differing in some details—the findings probably afford a fair basis for generalizations upon the whole of China's farm life. The surveyors covered a full year's operation of the farms studied and went at their task scientifically. The average size of the farms surveyed was 4.9 acres, while the ratio of crop area to total area was 93.2 per cent. Farm implements, the survey found, were of the most primitive nature, both in construction and material. The total value of tools and equipment per farm average \$8.82. A summary of the year's business on the 150 farms surveyed revealed the average annual income and expenditure per farm as follows:

The total annual return to the Chinese agricultural family, averaging, the survey found, 5.35 persons, from its land and labor thus comes to scarcely 100 silver dollars. After deducting the interest on its invested capital, the family has just under 40 silver dollars, less than \$4 gold per person, with which to meet all its needs not provided by the farm itself. Foreign-style goods, clothing, household equipment, implements of trade, social entertainments, and personal adornment must come out of less than \$4 per year. One has here the reason why advertising campaigns for the sale of western appliances and delicacies in China are largely confined to the populations in or adjacent to

the Treaty Ports, why efforts to introduce to the Chinese masses American notions having a vast popular appeal in the United States have generally failed.

COMMERCE. During 1926 the Chinese people exhibited in a marked degree their perseverance, power of reconstruction, and capacity for trading under adverse circumstances. Extensive military operations over large areas curtailed both trade distribution and industrial output. Floods in North China and the Yangtze Valley devastated crops, while boycotts, strikes, and irregular taxation were intimidations to business that tended to force up prices and increase the cost of living. A fall in silver exchange and the depreciation of local currencies at various times also served to multiply trade hazards. Despite these obstacles the combined value of China's export and import merchandise trade in 1926 totaled \$1,511,272,000, an increase of 15.3 per cent over the preceding year, and of 11 per cent compared with 1924 when conditions were much more orderly. Both imports and exports shared in the advance. The aggregate value of Chinese produce sold abroad increased from 776,353,000 taels in 1925 to 864,295,000 taels in 1926; while China's purchases of foreign goods totaled 1,124,221,000 taels, a gain of 15.6 per cent over the value of imports in 1925.

In the accompanying table, which lists the leading items in China's import and export trade, it is shown that 16 commodities constituted 51.7 per cent of the total value of imports into China in 1910 and maintained an average of 87.4 per cent for 1913, 1920, 1925, 1926:

VALUE OF PRINCIPAL COMMODITIES ENTERING INTO CHINA'S IMPORT AND EXPORT TRADE

[In millions of *hai*kuan taels—000,000 omitted]

Item	1910	1913	1920	1925	1926

All other	1.38	7.04
Total	100.00	100.00

Notwithstanding extremely adverse circumstances, China's exports to the United States during the first seven months of 1927 registered an increase in value of \$4,671,207 over figures for that period in 1926. The total value of exports for this period in 1927 reached \$73,723,439, compared with \$69,052,232 in 1926.

EXPORTS OF PRINCIPAL COMMODITIES FROM THE WHOLE OF CHINA TO THE UNITED STATES

Item	First 7 months of—	
	1926	1927
Silk, raw, wild, and waste	\$24,452,202	\$18,842,383
Furs, dressed and undressed	11,757,622	14,785,954

FINANCE. No definite or accurate statement of China's fiscal system or present financial situation can be given in its present period of political chaos. China has never had a budget, in the sense in which the term is used in western countries. The budgets published since the establishment of the Republic do not indicate

what the revenues and expenditures actually were—for those budgets were nothing but a hope that the revenues and expenditures would correspond with the estimates. China's budgets are practically meaningless, except that they may measure expectations under normal conditions.

The difficulties of developing a national budget system in China are obvious to any one familiar with Chinese currency. The numerous units of currency—none on a stable basis—are the main obstacle to a fiscal system, and no currency reform can be expected until a strong central government is set up with sufficient powers to enforce its currency regulations. Moreover, no fiscal policy can be enforced until a central government has the power to levy and collect the taxes in the provinces and bring these into the national treasury. The Central government in China, both before and particularly since the establishment of the republic, has not been able to collect taxes; only a small portion of the taxes reached Peking, the major part having been retained by numerous military governors who defied the authority of the Central government. In order to meet the growing expenditures, the Chinese government resorted to foreign borrowings, which piled up an enormous sum with no prospects for repayment. The only revenues now collected by the government are those administered by foreigners under special agreements and treaties with China.

A statement of the Chinese Government Financial Readjustment Commission (October, 1925) gives the following as the principal sources of revenue derived by the Chinese government: (1) The maritime customs and the native customs within the 15-mile limit; (2) the native customs outside the 15-mile limit; (3) the Salt Gabelle; (4) the wine and tobacco taxes; and (5) the stamp duty. All told, the amount of revenue normally collected each year from all these sources amounted to about 209,000,000 silver dollars. The net amount remitted to the Central government falls far short of this sum. Only the customs revenue and receipts of the Salt Gabelle remain partially intact, although both seemed impaired in 1926. The revenue from the maritime customs in the calendar year 1925 amounted to 78,100,000 haikwan taels and from the native customs (within the 15-mile limit), 4,500,000 haikwan taels. The total collected from the Salt Gabelle in 1925 amounted to 73,634,000 silver dollars of which only 32,935,000 reached the Central government.

China's national debt is as uncertain a quantity as are its revenues. Various estimates of the debt have been made from time to time by both private and public bodies, but no authoritative statement has yet appeared. As to national loans, the Chinese ministry of finance stated that they amounted to \$1,615,256,000 silver on Dec. 31, 1925. Another authority placed the total debt at \$2,256,537,960 on the same date.

COMMUNICATIONS. During 1925, 167,746 vessels of 128,203,625 tons entered and cleared Chinese ports. China has about 9370 miles of railway, including 1887 miles in Manchuria. Chinese railway operations in 1926 as in 1925 were extremely limited and revenue derived was accordingly small; in the majority of instances the railways were unable even to earn their operating expenses.

GOVERNMENT. During 1927, China was virtu-

ally without a constitution and indeed practically without a government at all. There was a very shadowy attempt at government with headquarters at Peking and there was the Nationalist government of Canton, representing the Kuomintang, or People's Nationalist Party, which controlled all of Southern China. The Cabinet of the Northern government as formed on Jan. 12, 1927, was made up as follows: Premier and Minister of Foreign Affairs, Dr. Wellington Koo; Finance, Tang Ehr-ho; Interior, Hu Wei-teh; War, General Ching-hui; Navy, Admiral, Hsi-Kwei; Communications, Pan Fu; Justice, Lo Wen-kan; Education, Jen Kao-Ching; Agriculture and Commerce, Yang Wen-kai.

HISTORY

A general summary of the situation in China during 1927 would reveal that there was no government which ruled the entire country. Practically speaking there were three armies in control of three different sections of the country: one in control of Peking, under the leadership of Chang Tso-lin; the Nationalists in the south under the command of Feng-Yu Hsiang; and the army of the Governor of Shansi, Yen Hsi-shan, who seemed to be losing his neutrality and to be definitely put out of the Chinese struggle by Chang Tso-lin. Generally the Nationalists were successful in the fighting of the year, but as it drew to a close they seemed to be a long way from complete domination. Many observers felt that the size of China and the number of Chinese will prevent the unification of the country.

SITUATION AT THE BEGINNING OF THE YEAR. The chief interest in the early months of the year was the intense activity on the part of foreign nations with interests and nationals in China to take all precautions to prevent loss of life and destruction of property because of the civil war and its approach to Shanghai. Practically all the countries involved sent troops and warships to the danger zones and then attempted to negotiate with one or both of the chief factions in the country. As noted in the preceding YEAR BOOK, notes were dispatched to the Nationalists late in 1926. These were based on a more or less divided attitude toward Northern and Southern China, but leaned rather more toward the Northern section because that part was pro-foreigner. The Nationalists rejected the proposition and at the end of January offered to negotiate separately with the powers. Then followed a series of notes, the first of which was from Great Britain, offering to give up the old systems of tariff control and extraterritoriality on the grounds that they were antiquated. The Nationalists broke off negotiations because of the movement of British ships and troops to the coast cities. The Peking government also complained of the troop movement declaring that it was a violation of the Washington Treaties and the covenant of the League of Nations.

On January 26 Secretary of State Kellogg in Washington issued a statement of the American position in which he stated that the United States had always desired the unity, the independence and prosperity of the Chinese nation. The Government of the United States "is ready now to continue the negotiations on the entire subject of tariff and extraterritoriality. The only question is with whom shall it ne-

gotiate. As I have said before, if China can agree upon the appointment of delegates representing the authorities or the people of the country we are prepared to negotiate such a treaty." France stated that she stood for a policy of "firm and prudent peace." The Japanese government in a statement of its policy declared that it was opposed to collective action in China and would use force only if absolutely necessary to protect Japanese citizens. Out of the maze of notes and replies it seemed as though the Nationalists were particularly bitter against Great Britain as being the chief cause of their troubles with foreigners in general.

The chief cause of foreign troubles was the struggle for Shanghai between the Northern and Southern forces and the refusal of the Nationalist army to guarantee that the city district would be a neutral zone on the request of the American ambassador. The fears of the foreigners were to some extent without foundation because, on March 21, the Nationalists took the city with little actual fighting. The conquering army looted the Chinese quarters but prudently stayed away from the barbed wire entanglements of the foreign quarter. On March 23, the Nationalists also captured Nanking further up the Yangtze River and the last important city in the hands of the Northerners south of that river. The conquest was not as peaceful for the foreigners as that of Shanghai had been. The British consulate was wrecked and the American consul and other American citizens took refuge on the property of the Standard Oil Company overlooking the river. They were fired upon here and warships in the river were compelled to open fire on the attackers and drive the mobs away, effecting a rescue. The American Admiral in command, Hough, sent an ultimatum to the Nationalist forces demanding adequate protection of foreign lives and property and demanding the presence of the Cantonese general aboard ship to negotiate concerning the outrages. The American government immediately dispatched more troops and ships to back up Admiral Hough's position. After a checkup had been made it was found that seven American citizens had been killed. The Nationalist government blamed the outrages on reactionaries and counter-revolutionaries, who committed the acts before the Nationalists were fully in charge of the city. The Nationalist government expressed full readiness to negotiate the matter with the United States and other powers.

With the conquest of Shanghai and Nanking, however, the Nationalists did not completely pacify the territory south of the Yangtze, because the party was broken asunder by internal strife. Chiang Kai-shek, a moderate radical, if there was such a class, was openly opposed by the radical nationalist government in Hankow, the centre of the southerners' government. The government apparently had come under the sway of Bolshevik influences and Chiang Kai-shek attempted to wipe out the communistic influences by executions and arrests. The result was a break in the Kuomintang party which forecast a lack of the unity necessary if China was to be pacified under the leadership of that party.

A temporary peace permitted the Nationalists to move further north and establish their lines on the Yellow River, which made it appear in June that the days of the Northern

group under Chang Tso-lin were numbered. As a matter of fact the press reported on numerous occasions that he was ready to negotiate with the Nationalists if they were prepared to give up their communistic ideas and arbitrate on the principles and ideals of Sun Yat-sen.

SITUATION IN THE SUMMER. The summer months saw the reopening of the temporary healing of the breach between the two forces of the Nationalists and, consequently, the capture of Peking was prevented. The radical Hankow forces definitely broke with Chiang Kai-shek, who lost much prestige by his defeat at the hands of Sun Chuan-fang which forced him back in his advance. As a result of his loss of military position and because of the internal struggle within his party Chiang Kai-shek resigned his post as generalissimo of the Kuomintang armies. In his statement of resignation he requested that the party heal the wounds which are dividing it, continue the struggle against Northern China and expunge the Bolshevik influences which were "boring from within" to destroy the magnificent organization the Kuomintang had built up. The leadership of the Nationalist troops was taken over by several leaders, whenever they could get sufficient followers.

SITUATION AT THE CLOSE OF THE YEAR. With the retirement of Chiang Kai-shek to Japan, where he established cordial relations with the Japanese government, the general advance of the Nationalists seemed to be stopped and to have lost its driving force. The Northern forces were successful in driving the Nationalists back across the Yangtze, where the armies were split up among various leaders. The Kuomintang movement had apparently completely collapsed. Marshal Chang Tso-lin's position in Peking, while safe from further attacks from the Nationalist armies, was threatened in the fall by the advance of General Yen Hsi-shan, the independent leader of Shansi province, who up to this time had remained neutral in the civil war struggle. He made a sortie from Shansi in the general direction of Peking but after taking several towns under the control of Chang he was forced to retreat and see his own province invaded. As the year closed Chang seemed to be firmly seated in the Peking region, while the remainder of the country was the prey to "war lords" and generals who had sufficient men and money to remain in the field. The foreign interests seemed in no danger of attack. See **TRADE-UNIONS**.

CHOATE, CHARLES FRANCIS, JR. American lawyer, died at Boston, Mass., November 30. He was born at Cambridge, Mass., Oct. 23, 1866, and graduated at Harvard in 1888. Two years later he was admitted to the bar in Suffolk County, Massachusetts, and he rose to a leading position among the attorneys of Boston and of the United States. After his success in the law had become well established, he became identified with several large corporations, and at the time of his death he was a director of the American Telephone and Telegraph Company, the New York, New Haven & Hartford R. R., the Merchants' National Bank of Boston, and other interests. In 1908 he was appointed a regent of the Smithsonian Institution, Washington, D. C., and held office from that time on.

CHRISTIAN CHURCH. A church originating in three religious movements, that of the Rev. James O'Kelly of Virginia, who, in 1792, opposed Methodist bishops, and those of the New England Baptist, Abner Jones, who organized a separate church in 1801, and of the Kentucky group, formed in 1804. These groups eventually united, all holding that minor points of belief should be subordinated to Christian brotherhood. A General Convention meets every four years, and convened at Urbana, Ill., in October, 1926. Biennial conventions are held in districts, each consisting of a number of States. The church carries on home and foreign missions, educational work, publication, evangelism, Christian unity work, social service, and other general activities. Its home mission field includes New Americans in the East, the lumber camps in Washington, Indians, mountaineers, and negroes; its foreign field, Japan, Porto Rico, and South America. It maintains eight educational institutions. Its publishing house at Dayton, Ohio, issues, among other periodicals, the oldest religious newspaper in the United States, the *Herald of Gospel Liberty*. In 1927 the Christian Church had 1141 churches, 1097 ministers, and 110,326 members, and a total revenue of \$1,617,468. Its Sunday schools, numbering 978, had 102,131 pupils.

CHRISTIAN ENDEAVOR, INTERNATIONAL SOCIETY OF. Formerly the United Society of Christian Endeavor; the name was changed to International Society of Christian Endeavor, August, 1927, by vote of the Board of Trustees. It includes all Christian Endeavor societies in North America, and is a member of the World's Christian Endeavor Union, which comprises Christian Endeavor societies in every country on the globe. The first society was organized in Williston Congregational Church, Portland, Me., Feb. 2, 1881, by the Rev. Francis E. Clark (q.v.), who was for many years president of the international and world's organizations. In 1925 he became president emeritus, and he died May 26, 1927. The most recent biennial convention of the international society was held at Cleveland, Ohio, July 4-9, 1927, with a total attendance of more than seventeen thousand. It planned to meet at Kansas City, Mo., July 4-9, 1929.

Recent activities of the international society included the establishment of a Department of Christian Vocations, under the direction of the Rev. Stanley B. Vandersall, which during the year gave vocational counsel to more than three thousand high school and college young people; a Department of Travel and Recreation, under the direction of Carroll M. Wright, which supplied free of charge monthly church-centred recreation service to Christian Endeavor societies and to interested church workers; it also conducted World Friendship Tours to Europe for young people at cost. The society promoted systematic and proportionate giving through the Tenth Legion, in which 73,859 were enrolled during the year. It emphasized regular habits of prayer and daily Bible reading, through the Quiet Hour, in which 252,622 members were enrolled.

The organization of the international society comprised an active organization for each State and each Canadian province. These in turn were

divided into 1200 city, county and district Christian Endeavor Unions, each including 400 to 500 societies. There were in 1927 approximately 80,000 Christian Endeavor societies throughout the world, with a membership of 4,000,000. The officers for the year were: President, the Rev. Daniel A. Poling, D.D.; vice presidents, the Rev. William Hiram Foulkes, D.D., and the Rev. Howard B. Grose, D.D.; treasurer, A. J. Shartle; secretary, E. P. Gates. The headquarters of the society are at Mount Vernon and Joy Streets, Boston, Mass.

CHRISTIANS. See **DISCIPLES OF CHRIST.**

CHRISTIAN SCIENCE. A system of metaphysical or spiritual healing discovered by Mrs. Mary Baker Eddy in 1866. The first church was established by Mrs. Eddy in Boston in 1879 and given a charter by the Commonwealth of Massachusetts. In 1892 it was reorganized as a voluntary religious association known as the First Church of Christ, Scientist, in Boston, called more frequently by its adherents "The Mother Church." Mrs. Eddy wrote the textbook of the movement, *Science and Health with Key to the Scriptures*, published in 1875. The Sunday services of the church are conducted by a first and second reader, the first reading from the textbook, and the second from the authorized version of the Bible. In 1927 there were over 8887 practitioners of Christian Science in the United States and other countries, who devoted their entire time to the healing of the sick through prayer.

A Board of Directors administered the affairs of The Mother Church. Its annual meeting was held in Boston, June 6. Reports indicated expenditures totaling \$1,286,984.76 from the General Fund of the Church during the year, and \$463,058.48 from the Permanent Special Funds. During the fiscal year ending May 31, 90 churches and Christian Science societies, including two university societies, were recognized as branches of The Mother Church; 20 new organizations were located in Europe, 2 in Africa and 1 in Australia. The total number of recognized branches, including 29 college and university societies, was 2277. Three departments conduct the principal activities of the movement: The Board of Education, Board of Lectureship, and Committee on Publication. The educational board instructs and authorizes students to teach Christian Science; the Board of Lectureship consists of 23 members who deliver free lectures on Christian Science throughout the world. During the year 3573 lectures were delivered, of which 3182 were in the United States and Canada, and 391 in foreign fields.

The Committee on Publication aims to correct impositions on the public in regard to Christian Science. It also endeavors to guard the rights of Christian Scientists against restriction by public authority. The Christian Science Publishing Society, which publishes and issues the authorized literature of The Mother Church, operates under a deed of trust granted by Mrs. Eddy; its affairs are now administered by a Board of Trustees according to the Manual of the church. The publishing society issues the daily paper of the movement, *The Christian Science Monitor*; other periodicals include: *The Christian Science Journal*, *The Christian Science Sentinel*, *Der Herold der Christian Science*, and *Le Hérault de Christian Science*. The Benevolent Association of the church conducts a sanato-

rium, where 1826 guests were provided for during the year. A training course is also conducted for nurses. The headquarters of the church are at 206 Massachusetts Avenue, Boston. Archie E. Van Ostrand was president of The Mother Church for the year ending May 31, 1927.

CHRISTMAS ISLAND. An island belonging to Great Britain in the Indian Ocean, lying 190 miles southwest of Java, annexed to the Straits Settlements in 1889. Area, 62 square miles; population, estimated in 1924, 995. Christmas Island is important because of its very large deposits of phosphate of lime which constitute its only exports. Exports in 1925 amounted to £203,103 and imports to £57,344. The chief imports are tools, machinery, railway materials, and lorries. For administrative purposes the island is connected with Singapore.

Christmas Island is also the name of the largest atoll in the Pacific Ocean. It belongs to the British colony of Gilbert and Ellice Islands.

CINCINNATI, UNIVERSITY OF. A coeducational institution of higher education at Cincinnati, Ohio; founded in 1870. The registration in the autumn of 1927 was 8604, distributed as follows: graduate school, 205; liberal arts, 1221; evening courses in liberal arts, 872; education 1158; engineering and commerce, 1309; evening commerce courses, 2808; applied arts, 294; household administration, 73; law, 196; medicine, 273; nursing and health, 105. In the summer school the enrollment was 2002. There were 551 members on the faculty. The endowment funds of the University for the fiscal year 1926 were \$6,100,302.56, and the income for the same period, \$1,653,682.86. The library contained 136,690 bound volumes and 40,000 pamphlets. President, Frederick Charles Hicks, Ph.D.

CITY PLANNING. In his presidential address before the National Conference on City Planning at Washington in May, 1927, John Nolen stated that plans had been made for 157 cities and that planning commissions had been established in 390 cities, the latter including every state in the Union except Arkansas, Idaho, Mississippi, Nevada, New Mexico and North Dakota. It should be understood that many of the plans had never got beyond the paper stage, and that most of the city planning commissions

had little besides advisory powers. Neither the number of cities for which plans had been made nor the number of planning commissions represented the activities of the cities of the country in such improvements to the city plan as street widening and extension which were going on in nearly every municipality at an immense total of expense for real estate taking and for construction work.

Chicago continued to lead in improvement to the major street plan, with St. Louis as a probable second (see **YEAR BOOK, 1926**). In each city the improvements to the city plan had been laid out by planning commissions. The same was also true in many other cities, but in hundreds of cases street widening and extension were being carried on as a part of the ordinary activities of street and engineering departments. The work of most, if not all, of the regional planning commissions noted in the 1926 **YEAR BOOK** was being continued. During the year, a model city and regional planning enabling act was completed by the Advisory Committee on City Planning and Zoning of the U. S. Department of Commerce, which stands ready to supply copies on application. The New York Legislature by Chapter 175 Laws of 1927 authorized the towns of the state, outside of incorporated cities and villages, to appoint planning commissions with power to approve plats and, when authorized by the respective town boards or governing bodies, to approve plans for parks, streets and subdivisions, and to make zoning regulations. The planning commission would also have the right to make studies and recommendations for the planning and development of their towns. Excess condemnation powers, sometimes of material aid in city planning, were tendered to counties in New York State by the adoption of a constitutional amendment at the November election, the vote being 1,065,000 for to 534,000 against. At the same time, an amendment to the city charter of New York was adopted which modifies existing excess condemnation authority in the interest of improved housing.

ZONING. The most notable features under zoning were the continued support of its legality by the United States Supreme Court and similar support by State courts, the latter in some cases based on the U. S. Supreme Court decision and in others the continuation of stands already taken by State courts; also, the adoption by popular vote of a constitutional amendment authorizing zoning in New Jersey, by a vote of nearly 3 to 1. This vote was significant because, until the highest court of New Jersey virtually nullified zoning, that State led in the number of zoned cities. In Virginia, the legislature authorized the supervisors of Arlington County, adjoining the District of Columbia, "to regulate the use of land and of buildings or other structures and the height thereof and also to establish building lines and to regulate and restrict the construction and location of buildings and other structures."

Following its 1926 decision (see 1926 **YEAR BOOK**) upholding the zoning ordinance of Euclid, Ohio, the U. S. Supreme Court in 1927 supported zoning ordinances in three other cities in as many different States. The Euclid decision upheld zoning in general as well as the specific ordinance in question, the plaintiff in the Euclid case urging that the entire ordinance as well as zoning in general was unconstitutional. On

March 21, the U. S. Supreme Court sustained a Minneapolis ordinance in respect to the exclusion of a four-family apartment house from a one-family residence district. There was no written opinion in this case, the court referring to its basic decision (*Village of Euclid, Ohio, v. Ambler Realty Co.*, 272 U. S. 365). In *Zahn v. Board of Public Works of Los Angeles* (47 Sup. Ct. Rep. 594) the U. S. Supreme Court supported a decision of the highest Appellate Court of California, which in turn had overruled a lower State court, in the exclusion of a proposed business building from a residence district.

On May 31, 1927 (2 U. S. Daily, 597), the U. S. Supreme Court upheld the zoning ordinance of Roanoke, Va., as regards a requirement that buildings should be set back a certain distance from the street line. Two Federal district court decisions upholding the zoning ordinance of Minneapolis, Minn., were rendered on September 8 (reported in full in the *United States Daily* for Sept. 21 and 22, 1927). This ordinance, as already stated, had already been upheld by the U. S. Supreme Court.

In one of these cases, the American Wood Products Co. attempted to compel the building inspector of Minneapolis to grant a permit for a building to be used for factory purposes in a district zoned for multiple-family residences, where it and a co-complainant already had buildings in use for business purposes and wished to extend them. In the other of these two cases, the complainant wished to establish an oil-filling station in a district zoned for residences. In both cases the judge accepted evidence to the effect that the properties in question were of less value for residence than for business purposes, but nevertheless he upheld the ordinance—although his personal opinion was that while “the theory of zoning ordinances is good,” yet “in practical operation, they must almost necessarily give far too little consideration to the rights of many individual property owners.”

Indicative of the fact that the federal courts take into account the reasonableness of zoning ordinances is a decision of the Circuit Court of Appeals for the Sixth Circuit declaring the exclusion of an orphanage on the cottage plan from a single-family residence district in the village of University Heights, Ohio, to be unreasonable (*U. S. Daily*, Aug. 5, 1927). The State Supreme Court of Missouri, on July 11, reversed itself in conformity with the Euclid decision of the U. S. Supreme Court. In earlier cases, the Missouri Court had held that owners of property reduced in value by zoning ordinances were entitled to collect damages from a city.

NUMBER OF ZONED CITIES. In continuation of earlier bulletins, the U. S. Department of Commerce, through its Division of Building and Housing, brought its data on zoned cities and zoning litigation down to July, 1927. The bulletin showed 553 zoned cities in the United States, with a total population of over 30,000,000; or more than 55 per cent of the urban population of the United States. Of these 553 cities, 52 have populations of 100,000 while at the other extreme 49 have populations of less than 1000.

By States, New York State leads with 93 zoned municipalities, and is followed by New Jersey with 75, Illinois with 58, California and

Massachusetts with 54 each, Pennsylvania with 32, while Ohio stands seventh with 29.

BIBLIOGRAPHY. The new books in this field were Baker, *Legal Aspects of Zoning* (Chicago); Nolen, *New Towns for Old* (Boston).

CIVIC FEDERATION, NATIONAL. See NATIONAL CIVIC FEDERATION.

CIVIL ENGINEERS. AMERICAN SOCIETY OF. An association of professional engineers, founded in 1852 to advance engineering and architectural knowledge and practice, maintain high professional standards, and encourage intercourse between men of practical science. It is made up of: Members, including civil, military, naval, mining, mechanical, electrical, and other engineers in active practice twelve years, and qualified to design as well as direct engineering work; associate members, those who have been practicing eight years; juniors, beginners in the profession; affiliates, persons qualified to cooperate with engineers, but not themselves engineers; fellows, contributors to the permanent funds, who are not eligible to membership; and honorary members, persons of acknowledged eminence in engineering. Four general meetings are held each year: The annual meeting held the third week in January, in New York, at which the results of a previous ballot for officers are announced, reports of committees received, and other business transacted; the annual convention held during the summer, with general business and technical sessions, and interesting excursions; and the spring and summer meetings. In addition, there are monthly meetings in New York City, as well as meetings held by the local sections.

In 1927 there were 46 local sections, and 90 affiliated student chapters in colleges throughout the country. The membership, as of November 15, 1927, was 12,590, divided as follows: Honorary members, 15; members, 5378; associate members, 5619; juniors, 1429; affiliates, 141; fellows, 8. The annual meeting was held on January 19-21; and the spring meeting in Asheville, N. C., April 20-22, at which the important business included a consideration of water supply, highways, and a conference on student chapters. Notable features of the annual convention in Denver, Colo., July 12-16, were, a conference of local section representatives, and discussion of city planning, highway, irrigation, and surveying and mapping questions. The autumn meeting was held on October 12-15, in Columbus, Ohio, and gave most of its attention to the question of flood control, with special reference to the Mississippi River. At these meetings nine technical divisions presented papers and carried on independent committee work. Sixteen special committees, enlisting 100 members, followed out investigations during the year. Eighty-five members of the Society served on joint committees and boards with representatives of other societies, for research and standardization. The Society publishes monthly *Proceedings*, containing the papers presented at meetings, with discussions, and items of general interest. At the end of each year, the papers and discussions are republished in the annual volume of *Transactions*. The Society also issues an annual *Year Book*. The officers for 1927 were: President, John F. Stevens; vice presidents, Allen Hazen, Walter L. Huber, John C. Hoyt, Arthur E. Morgan; secretary, George T. Seabury; treasurer, Otis E. Hevey. The headquarters of the Society are in

the Engineering Societies Building, at 33 West 39th Street, New York, of which, with three other national engineering societies, it is joint owner, as well as of the engineering library there installed.

CIVIL SERVICE AND PERSONNEL PROBLEMS. There was a general impression prevailing during the year in the United States that the extension of the merit system was neither so strong or so extensive as it should be to keep up with the growth and development of government functions. Although 41 State legislatures were in session in 1927, only Texas and Pennsylvania had bills introduced to place the State service under civil service regulation and neither State enacted a law.

In the Texas legislature three bills were introduced; one was drafted by the National Civil Service Reform League and endorsed by civic organizations in the State. At a special session of the legislature, a compromise bill was reported by committees of the House and Senate, that provided for a law to be administered by the State Board of Control and that applicants for examinations must be recommended by their local city council, or, if they did not reside in cities, by the County Commissioner's Court. It also provided for the exemption of all "confidential" positions. This bill was passed in the House and lost after extensive and sharp debate in the Senate through a vote to adjourn to a time within 24 hours of the close of the session. Under the Senate rule that no bill except conference reports may be voted on during the 24 hours before final adjournment, no further consideration could be given to it. Senator Pollock, who had introduced a civil service bill at each of the last three sessions, but failed to get them out of committee, predicted that a civil service bill would pass at the next session. The League urged that his particular bill be defeated for the reason that in all probability it would not bring a real merit system into operation.

The civil service bill rejected by the Pennsylvania legislature would have established a State Personnel Commission of three members whose functions would include ascertaining and recording the duties, responsibilities and authority appertaining to positions in the classified service and classifying such positions.

In Colorado a proposal to submit to the voters at the next general election a civil service amendment to the state Constitution was defeated. The amendment proposed differed from the constitutional provision in force in that it placed all court employees in the unclassified service and that it eliminated the clause providing for the appointment of the person standing highest on the eligible list. It provided for removal "after trial," but did not state before whom or what body the trial should be held.

California enacted a law providing, in place of the present single civil service commissioner, a commission with one executive member and two associate members. Four states introduced bills to apply the merit system to city fire departments, but none was passed. Veteran preference bills were frequent. A Montana bill extended the preference to veterans' widows, and a Massachusetts bill gave a preference to veterans of Indian wars, but these were defeated. New Jersey enacted a law providing for the standardization of county and city salaries. Massachusetts defeated a bill establishing a classification of the

appointive officers and positions of the State into services, groups and grades, and adopting the salary levels recommended by Griffenhagen and Associates, Ltd., and providing for the application and administration of such classification.

In Michigan, Wayne County, in which Detroit is situated, was placed under a civil service law, that provides that the commission shall consist of three members to serve for overlapping terms of six years, each appointed by the Board of Supervisors. Unfortunately, the Commission is not given power to certify payrolls, but it is given the power to hear appeals from removed employees and to reinstate them.

An example of more or less freakish bills frequently introduced was one introduced in the legislature in Massachusetts that would have provided that the civil service commissioner "shall not certify a married woman for appointment or authorize the provisional or non-competitive appointment of a married woman, unless she established to the satisfaction of the commissioner that her husband is physically or mentally unable to support her or that she is living apart from her husband for 'justifiable cause.'" The unfortunate state civil service commissioner, therefore, would be under the burden of determining whether or not a married woman was living apart from her husband for a "justifiable cause."

A Nebraska measure provided that no married woman was available for the position involved unless the combined salaries of the woman and her husband were less than \$2000 a year. The Wisconsin legislature considered a bill which provided that candidates for election to the office of County Highway Commissioner must first pass an examination conducted by the State Highway Commission before their names were placed on the ballot.

Alameda County, Calif., adopted by popular vote (41,237 to 34,302) a new charter for the government of the county, at the November election, 1926, and thus brought into existence the fourth county civil service commission in the United States. The others are in Cook County, Ill., Los Angeles County, Calif., and Milwaukee County, Wis. Oakland is the largest city in Alameda County, and political strife there over the operations of the Alameda County civil service provision seemed to have started soon after the act took effect on Jan. 1, 1927. The County Board of Supervisors appointed a Commission, one of whose first acts was to determine the jurisdiction of the Commission over deputies of the Sheriff. The Commission, upon the advice of the District Attorney, assumed control over the appointment of all the new deputies, but the new sheriff refused to accede to the jurisdiction of the Commission because the Commission certified only twenty-one names for nineteen vacancies. He contended that the charter provision required a certification of three names for each vacancy, and that therefore for nineteen vacancies there must be certified fifty-seven names. One of the Sheriff's new appointees, whose number was 45 on the eligible list, claimed the right to certification for one of the nineteen vacancies, and was to sue the Commission to compel it to certify him.

The charter provision was defective in that it did not give the Commission any control over the certification of payrolls, and its power to enforce the provisions of the law depended en-

tirely upon the coöperation given it by the County Auditor. The Commission seemed to have the support of the legal authority of the county and the District Attorney advised the County Auditor not to pay the salaries of any of the appointees of the Sheriff whose employment was not approved by the Civil Service Commission.

Cincinnati's Civil Service Commission made an effort to eliminate political activity on the part of municipal employees in the classified civil service. In a letter the Commission stated that "as no employee in the classified service of the city is permitted to engage in such political activity, it would appear that you have violated the civil service law and rules of this commission which forbids any activity of this character whatever on the part of classified service-employees." It was said that each of the persons involved (some 200) would be given a hearing before the commission and an opportunity to explain the alleged political activity.

An attempt was also under way to simplify the organization of the municipal government of Cincinnati. The 26 departments and bureaus of the municipal government would be coördinated and consolidated into 12 distinct departments, all under the jurisdiction of the City Manager, providing the new administrative code was formally adopted by the City Council. The reorganization programme contemplated the creation of a "Personnel Department" in which all activities respecting the management of the personnel of the city would be concentrated.

The President of the Commission announced that a reclassification of the Cincinnati city service, made under the direction of the Civil Service Commission, was nearing completion. The new classification, it was said, would group the city employees under 369 distinctive classes of positions. This would bring about a reduction of approximately 100 payroll titles that had hitherto been in use. The new classification was divided into seven major subdivisions or services; namely, clerical and administrative, engineering, public health, welfare, police and fire, domestic and janitorial, and skilled trades and labor.

Mr. Gamble described the need for the classification as follows:

The primary object of the classification is, of course, to provide the Civil Service Commission with a necessary working tool. We have never had adequate information regarding the positions we are required to fill. Department heads will find the classification useful in requisitioning new employees. It will also prove of substantial value in clarifying and simplifying the budget and the city payrolls. Members of the city council and the public will know definitely what kinds of positions are being appropriated for. The new titles have a definite meaning; some of those now in use are not at all descriptive of the work involved. In the case of the new classification of senior stenographer, for example, it is found that sixteen different payroll titles are now used to describe this type of employment.

These acts of the Cincinnati Civil Service Commission were directly in line with the recommendations made by the Secretary of the National Civil Service Reform League in a report made on an investigation of the work of the Cincinnati Commission in 1926.

This was a measure showing when the number of states, counties, municipalities and other political subdivisions was considered, with the extension of government into so many new directions. There was a feeling of disappointment to be noted on the part of the Federal Commis-

sion and similar bodies, the Bureau of Public Personnel Administration, the National Assembly of Civil Service Commissions and the National Civil Service Reform League and its allied organizations. The merit system began its advance some forty-four years previously with the passage by Congress of the Pendleton Civil Service Act. The aggressive activity of the leaders of the movement in the first twenty years was responsible for its rapid spread. Its jurisdiction was extended over the greater part of the Federal service, leading cities were placed under its control and several States adopted it. At one time there were 11 States with civil service commissions; in 1927 there were nine, Kansas and Connecticut having repealed their laws. The zeal that carried the system forward at the hands of Curtis, Schurz, Eaton, Bonaparte, and Roosevelt had subsided. The aggressive leaders were gone and there were few to take their places. Thirty-nine State governments lie outside the fold and nearly a dozen cities having more than 100,000 inhabitants have their employees chosen for political reasons.

There was good reason to believe that, in most parts of the United States and Canada, the merit system, as administered by a central personnel agency, no longer commanded the general public interest it did a generation previously. Laws providing for the system having been enacted in the most populous jurisdictions, the public was hardly likely to maintain a keen interest in the technical phases of their administration. Those adversely affected or unsympathetic with the idea, on the other hand, are provided with a definite target for their arrows. Nevertheless the all but universal disappearance of the old zeal for a measure designed to improve public administration can but be a cause for concern.

Along with a marked falling off in popular esteem however, went a truly remarkable improvement in the technical phases of public personnel administration. Even the weakest public employment agency is likely to do a number of things better to-day than the most advanced were able to do them fifteen years ago. The duties classification, essential for any scientific attack on personnel problems, is universally regarded as desirable by public personnel administrators and, in a crude or refined form, is usually available for working purposes; this is in marked contrast to the commercial world, where the "job analysis" idea has as yet won only scant recognition. The best tests used even ten years ago are now eyed askance when they have not been discarded for more efficient measuring devices. The public, even though less interested in the merit system, ought, in the opinion of the Bureau of Personnel Administration, to be made aware of the improvements in the handling of technical personnel problems.

Practical nullification of the merit system, in spite of charter provisions intended to provide for it, seems to be the result of bad administration under the city-manager form of government provided in Kansas City. The Charter provides for the appointment of a personnel director by the City Manager, for the classification of positions according to duties, for competitive tests from which eligible lists may be made, for a system of service records, and for other conventional devices, for the management of employees of the government unit. There are

strict prohibitions against political contributions and political activity on the part of employees is forbidden, but, as a matter of fact, the appointing officers are permitted to select any one from the eligible lists. The City Manager, H. F. McElroy, however had apparently yielded to the importunities of local politicians and appointed a Personnel Director who had no sympathy with the merit system and apparently no knowledge of civil service methods. The result was, according to the Kansas City Civil Service Institute, that no duties classification had been prepared, and no examination for any position had been given. All appointments were made without examination. No eligible lists were created. All appointments were, therefore, temporary. No transfer rules were prepared. No tests for laborers were prescribed. No efficiency or seniority records were devised. No rules for promotion were made. In short, there seemed to be no evidence of the existence of a civil service section in the Charter, so far as administrative operations were concerned, excepting for the checking of payrolls and the filing of an application blank on the part of new appointees.

During the past few years, and markedly during 1927, the professional service was attracting less and less of the high-grade men to the public service. Particularly is this true of engineers, doctors and nurses. New York City was not able to supply the departments with engineers and the competition in this service was practically nil. The same thing was true of Chicago, and Philadelphia had been having trouble for some years with recruiting men of the proper calibre for these services.

In the Federal service the principles of civil service were extended to the Prohibition Enforcement service. (See PROHIBITION.) Congress applied the competitive system to all positions with the sole exception of the Commissioner. It did not blanket in the existing force, but vacated all of the 2500 positions and required that the occupants should only be retained if reached for appointment upon open competition on the same basis with all other persons. This was the most drastic application ever made of the competitive principle and was significant since friends and critics alike of prohibition and of the merit system halted the filibuster in the closing days of Congress long enough to classify the new Prohibition Bureau. The estimate of \$200,000, however, for the conduct of the examinations failed of passage along with important legislation affecting seats in the Senate, pension appropriations, compensation for injuries and public buildings.

All parties had reached the conclusion that conditions in the prohibition force under the wide-open spoils system prevailing had become intolerable, and were a reflection not alone upon prohibition enforcement, but upon Congress and the country. In an effort to improve that situation Congress placed the responsibility for testing the personnel upon the Civil Service Commission. It is to be recorded, however, that while the placing of the Prohibition forces under civil service was a notable compliment to the principles of the merit system, considerable doubt was being expressed by its friends as to whether even that system could withstand the corrupting influences surrounding and supporting the illicit liquor traffic. The last step in the examinations for the administrative positions was the

character investigation. Twenty-two trained men of the Commission's force were engaged in it. Finger prints of applicants were made at the time of the oral examination.

Each year, Congress places the personnel of new offices or groups of positions within the provisions of the civil service law. Among the new or expanded activities thus placed were the Aeronautical Bureaus of the War Department and the Navy Department; the new Bureau of Civil Aviation in the Department of Commerce; the Board of Mediation, which absorbed the United States Railroad Labor Board; the division of Cooperative Marketing, Department of Agriculture; the enlarged public buildings programme; military post construction under the War Department; the new Bureau of Customs; the Federal Industrial Institution for Women under the supervision of the Department of Justice; probation officers of the United States courts; the new Radio Commission; the field force of the Employees' Compensation Commission due to the Seamen's and Longshoremen's Act; and the Foreign Commerce Service of the Bureau of Foreign and Domestic Commerce.

The whole number examined during the year ending June 30, 1927, for appointment in the federal executive civil service was 559,138. Of this number 422,998 were classified, leaving 136,140 not subject to examination under the civil service rules. In addition, examinations were held for 15,650 Presidential postmasters; for unskilled laborers; firemen and policemen of the District of Columbia, and some other classes of positions outside the classified service.

Congress had to its credit the enactment of the so-called Hoch law, which standardized and stabilized the foreign commerce service in the Bureau of Foreign and Domestic Commerce. This law had the strong support of the Administration, emanating from Secretary Hoover's office. It provides that the Secretary of Commerce shall appoint officers of the foreign service after competitive examinations, to be held by the Civil Service Commission in cooperation with the Department of Commerce. This had been the procedure for a number of years, merely, however by working agreement between the Commission and the Department. A new Secretary of Commerce could have overthrown it at any time.

So far as the classification work in the Federal service goes, there was little to report. The bill intended to place the functions of the Classification Board in the Commission failed of passage, and that Board was making very slow progress. It had done some things with respect to a classification of the field service which constituted a real step in advance, but they must run the gauntlet of Congress again in order to make the classification effective.

Are public personnel records confidential, was the question involved in a suit brought by Ellery C. Stowell, president of the Better Government League against the Federal Civil Service Commission. Mr. Stowell requested from the commission a list of the temporary employees in the Federal Department Service. The Commission denied that it was one of its duties to keep such a list and that the petitioner did not show a sufficient legal or legitimate interest in the premises to entitle him to maintain the proceeding; and that to furnish him such a list would interfere with other of their employees who were daily posting and making changes in the

records and that the list contained the records of temporary confidential agents and investigators and that it would be incompatible with the public interests to allow an indiscriminate inspection of these records by private individuals. The Court refused the petition and sustained the Commission.

CIVIL SERVICE REFORM LEAGUE, NATIONAL. An organization founded in 1881 for the purpose of putting to an end the so-called spoils system of making appointments to public office. It has sought to accomplish this end by promoting administrative efficiency through the application of the merit system to the appointment, promotion and tenure of government officials. The League is made up of local associations and of individual members not in local groups.

During 1927 the League continued its programme of sponsoring legislation to empower the President to place in the classified civil service all Federal positions exempt by statute. It made an investigation of the need for the extension of the Civil Service Act to the employees of the District of Columbia and appointed a committee to study the problem involved in a reorganization of the departments of the Federal government. The League was successful in arousing public opinion to an extent which induced Congress to enact a law placing prohibition agents under civil service regulation and also a law prohibiting the sale of Federal offices. Through its Field Division the League endeavors to secure the adoption of civil service laws in various states and cities. Reports of its investigations are issued from time to time. *Good Government* is the official organ of the League. The officers in 1927 were: President, George McAneny; treasurer, A. S. Frissell; secretary, Harry W. Marsh. Headquarters are at 8 West 40th Street, New York.

CIVITAN CLUBS. An organization composed of selected professional and business men, throughout the United States, who have dedicated themselves to unselfish service to their city, county, state or nation. The first Civitan Club was founded at Birmingham, Ala., in 1917. Civitan, a word coined by one of its founders, and meaning "the citizen," has as its motto "Builders of Good Citizenship." The organization of field work of the club did not begin until 1920, but by 1921, when the first annual convention was held, there were 30 clubs; the membership in 1927 was over 7500, clubs having been organized during the year in New York, Ohio, Michigan, Virginia, Kentucky, North and South Carolina, Tennessee, Alabama, Florida and California. At the seventh annual convention, held in June, 1927, in Nashville, Tenn., the programme of Civitan was stressed and the control of tuberculosis and the curbing of crime were especially emphasized. Several clubs have jointly sponsored the building of tuberculosis hospitals, notably in Knoxville, Tenn., where \$150,000 was raised for Beverly Hills, a tuberculosis sanatorium, and the Greer and Greenville Clubs which were also successful in raising \$150,000 for a sanatorium at Greenville, S. C. Among the activities of the individual clubs were the sponsoring of good citizen essay contests; care of crippled children; underprivileged children, baby clinics; scout work, boy scout camps; programmes against crime; building of municipal golf courses; pig, corn and cotton clubs; street paving; Americanization work; constructive

health programmes; juvenile court work; city beautification; and the raising of scholarship funds. The official publication is *The Civitan*, a monthly, published at Knoxville, Tenn., Neal B. Spahr, Editor. The national officers for 1927 were: Sanford Hymans, San Francisco, president; vice-presidents, James N. MacLean, New York; George W. Simons, Jr., Jacksonville, Fla.; Neal B. Spahr, Knoxville, Tenn., secretary; Claude L. Hagan, Birmingham, Ala., treasurer; Charles F. Lender, Columbus, Ohio, and Arthur Cundy, Sarasota, Fla., field secretaries. The headquarters of the association are at 1001-02 Jackson Bldg., Birmingham, Ala.; secretary's office, 1115-16 General Building, Knoxville, Tenn.

CLARK, FRANCIS EDWARD. American Congregational clergyman, founder and president of the United Society of Christian Endeavor, died at Newton, Mass., May 26. He was born of American parentage at Aylmer, Quebec, Sept. 12, 1851, and after graduating from Dartmouth in 1873 studied at Andover Theological Seminary for three years. He became pastor of the Williston Church, Portland, Me., and in February, 1881, founded the Society of Christian Endeavor. He was pastor of the Phillips Church, South Boston, Mass., in 1883, serving until 1887, from which time he devoted himself to Christian Endeavor work as president of the United Society of Christian Endeavor, in which capacity he was engaged until 1925, when he became president emeritus. He traveled around the world five times in the interests of the work, and wrote extensively on religious and other topics. He received the degree of D.D. from Dartmouth in 1889, and that of LL.D. from Iowa College in 1902. He had served as union preacher at Cornell and other colleges. His writings include: *Our Vacations* (1874); *Life of William E. Harwood, Portland, Me.* (1877); *The Church and the Young People* (1882); *Our Business Boys* (1883); *Looking Out on Life* (1883); *Danger Signals* (1884); *Young People's Prayer Meetings* (1887); *Ways and Means* (1890); *Christian Endeavor Saints* (1890); *Our Journey Around the World* (1894); *The Everlasting Arms* (1895); *The Great Secret* (1895); *World-Wide Endeavor* (1895); *Old Lanterns for New Paths* (1898); *The Mossback Correspondence* (1898); *Fellow Travelers* (1898); *A New Way Around an Old World* (1900); *Training the Church of the Future* (1902); *Christian Endeavor Manual* (1903); *Christian Endeavor in All Lands* (1906); *The Continent of Opportunity* (1909); (with Mrs. Clark) *The Gospel in Latin Lands* (1909); *Similes and Figures from Alexander MacLaren* (1910); *Old Homes of New Americans* (1912); *The Holy Land of Asia Minor* (1914); *In Christ's Own Country* (1914); (with Sydney A. Clark) *The Charm of Scandinavia* (1914); *Christ and the Young People* (1916); *In the Footsteps of St. Paul* (1917); *Our Italian Fellow Citizens* (1919); *The Gospel of Out-of-Doors* (1920); and *Memories of Many Men in Many Lands* (1923). He edited, with introductory selections: *The Presence of God* (Bishop Jeremy Taylor) (1899); *Living and Loving* (Prof. A. Tholuck) (1899); *The Kingdom Within* (Thomas & Kempis) (1899); and *The Golden Alphabet* (Master John Tauler) (1899).

CLARK, JOHN GOODRICH. American surgeon and professor of gynecology in the medical school of the University of Pennsylvania, died at Philadelphia, Pa., May 4. He was born in Wayne County, Ind., June 4, 1867, and was educated at Earlham College and Ohio Wesleyan University, later taking the degree of M.D. at the University of Pennsylvania. He did post-graduate work at Johns Hopkins University and at the Universities of Leipzig and Prague, and was appointed associate in gynecology at Johns Hopkins in 1899. In 1899 he was appointed professor of gynecology at the University of Pennsylvania, serving as gynecologist-in-chief of the University Hospital. He was a member of the general medical committee of the Council of National Defense in 1917, and in the same year president of the Clinical Congress of Surgeons of North America. He belonged to many medical and other organizations, and frequently contributed to the medical press.

CLARKE, HUGH ARCHBOLD. An American organist and composer, died at Bryn Athyn, near Philadelphia, Pa., December 16. He was born in Toronto, Canada, Aug. 15, 1839. He filled several positions as organist in Philadelphia, the last at the Presbyterian Church (1875-97), and was conductor of the Abt Male Chorus. From 1875-1925 he was professor of music at the University of Pennsylvania, retiring on account of impaired eyesight. He wrote an oratorio, *Jerusalem* (1891), incidental music to Aristophanes' *The Acharnians* and Euripides' *Iphigenia in Tauris*, piano pieces and songs. Besides, he was the author of a treatise on harmony and of one on counterpoint, *Music and the Comrade Arts* (1900) and *Highways and Byways of Music* (1901).

CLARK UNIVERSITY. A non-sectarian university, comprising a college for men and a co-educational graduate division of arts and sciences, at Worcester, Mass.; founded in 1887. The registration for the autumn of 1927 was 529, including 259 undergraduates, 71 graduate students, 55 special students and 152 extension students. The enrollment for the summer session was 219. There were 40 members in the faculty. During the year Dwight E. Lee was appointed assistant professor in history and international relations to fill a vacant chair. The productive funds amounted to approximately \$5,000,000. The library contained 105,000 volumes. President of the University, Wallace W. Atwood, Ph.D.

CLEMENT, PERCIVAL WOOD. Former Governor of Vermont, died in Philadelphia, Pa., January 9. He was born at Rutland, Vt., July 7, 1846, and, after studying at Trinity College, Hartford, Conn., entered the marble business at Rutland. In 1876 he engaged in banking and from 1882 to 1902 he was president of the Rutland Railroad Company. He was president of the Bristol Railroad Company, and director in the Clement National Bank and the State Trust Company, and was owner of the *Rutland Herald*. He served as Mayor of Rutland, 1897-99, and 1911-12. He was a member of the Vermont House of Representatives in 1892 and of the Vermont Senate in 1900-02 and 1911-12. He was a Gover-

nor of Vermont in 1919 and 1920. His political career was marked by opposition to the prohibition movement in Vermont.

COAL. The total production of bituminous coal in the United States during the calendar year 1927 was estimated by the U. S. Bureau of Mines at 519,762,000 net tons. In comparing the estimate for the year 1927 with the figures for earlier years given below, it should be borne in mind that the preliminary estimate was subject to slight revision.

ESTIMATED UNITED STATES PRODUCTION OF BITUMINOUS COAL
[Net tons *]

Period	Production	Average per working day
Calendar year:		
1927 ^b	519,762,000	1,690,000
1926.....	578,867,000	1,864,000
1925.....	520,058,000	1,692,000
1924.....	483,687,000	1,578,000
1923.....	564,565,000	1,845,000
1922.....	422,268,000	1,879,000

* Figures for calendar years 1922-1926 are final figures as reported by the operators. Those for 1927 are preliminary estimates.

^b Subject to revision.

The estimated total stock of bituminous coal in the hands of commercial consumers on Jan. 1, 1927, was 55,000,000 tons. By April 1, this had increased to 75,000,000 tons and at the end of the year it was estimated at 55,500,000 tons, the decrease during the year being gradual. With the decrease in production there was a total withdrawal from storage between October 1 and the end of the year of 6,400,000 tons. Naturally in 1927 the leading feature was the bituminous coal strike which is comprehensively discussed under **STRIKES AND LOCKOUTS; LABOR; and TRADES-UNIONS** (qq.v.). This began with the expiration of the Jacksonville wage agreement on March 31, when the consumers had some 75,000,000 tons in storage, a stock which had been built up during the last part of 1926 and the first quarter of 1927 when production was heavy, averaging 13,181,000 tons weekly as against a consumption estimated at 11,430,000 tons. Production then dropped to a weekly average of slightly over 8,000,000 tons, though increasing in the summer and running over 10,000,000 tons in October. The average price for January was \$2.84 and for July \$1.87 and the average for December was \$1.90.

In the production of bituminous coal, West Virginia, Pennsylvania and Kentucky led during the year though when mining was resumed in Illinois the output from Kentucky dropped, but the year's production was estimated to show an increase of about 7,000,000 tons over 1926 and prices were satisfactory. In Colorado the coal output showed a decrease of nearly 2,000,000 tons due to a strike called by the I. W. W. who insisted on the Jacksonville scale. The operators had made a voluntary increase of wages but this did not prevent the strike which had the usual accompaniments of riots and picketing.

The exports of bituminous coal from the United States during 1927 totaled 16,081,914 tons, valued at \$71,323,924, as compared with 31,492,801 tons, valued at \$155,817,572 in 1926. These figures do not include fuel or bunker

coal laden on vessels engaged in foreign trade, which in 1927 totaled 4,076,141 tons, valued at \$22,977,203 as against 6,906,791 tons valued at \$38,025,411 in 1926. Canada as stated below was the leading customer of the U. S. taking 13,030,622 tons valued at \$55,620,645 in 1927 as compared with 12,172,779 tons valued at \$52,202,634 in 1926. These figures indicate the restoration of normal conditions in Europe, where in 1926 the exports to France were 485,844 tons, to Italy 1,542,015 and to other European countries 12,083,965 tons in 1926 as compared with 106,823 tons to France in 1927, 321,120 tons to Italy and 278,962 to other European countries.

The imports of coal and other related fuels into the United States in 1927 amounted in value to \$5,028,161, as compared with \$12,272,519 in 1926. The leading fuel import in 1927 was bituminous coal of which 541,295 tons valued at \$2,446,564 entered the United States. Of this amount Canada supplied 492,003 tons, valued at \$2,187,571.

UNITED STATES PRODUCTION OF ANTHRACITE COAL. Total anthracite production in 1927, based upon official figures to the middle of December and estimated tonnages for the remainder of the year, was approximately 72,000,000 gross tons against 75,390,582 tons in 1926. According to the Anthracite Bureau of Information total commercial production—that is, total production less the coal consumed at the mines for power—was approximately 66,000,000 gross tons, compared with 69,648,420 gross tons in the previous year. Total shipments to markets outside the region for 1927 aggregated about 63,500,000 or 64,000,000 gross tons compared with 67,248,946 gross tons in 1926. Shipment figures for the decade ended with 1927 are:

SHIPMENTS OF ANTHRACITE FOR TEN YEARS,
1918-1927

Year	Gross tons
1918.....	76,907,687*
1919.....	67,599,720
1920.....	68,185,705
1921.....	69,816,877
1922.....	40,863,359*
1923.....	73,146,890

* War year, with exceptionally large washery and dredge shipments.

† Strike years.

‡ Estimated.

The exports of anthracite from the United States in 1927 totaled 2,969,203 tons valued at \$32,927,796, as against 3,597,931 tons valued at \$41,085,946 in 1926.

For the ten years preceding 1927, including the two abnormal war years 1917 and 1918, and the subnormal strike years of 1922 and 1925, average anthracite shipments were 65,671,043 tons. Shipments for 1927 were therefore about 3.5 per cent below the ten-year average and about 5.5 per cent below the 1926 record. In explanation of this reduction in shipments for 1927, weather conditions were the most important factors. The winter of 1926-1927 was very mild, especially after Jan. 1, 1927, and the amount of coal actually burned during the first four months of the year was below normal. This in turn unfavorably affected the usual early

spring demand for refilling bins. There was less demand than usual, during the summer, for the coming winter's supply, and all these conditions were followed by a very mild and late autumn.

An outstanding feature of the year within the anthracite region itself was the rise of a spirit of cooperation including all those directly interested in the welfare of anthracite. Producers, mine employees and the general public of the coal region, especially the business interests, united in a movement of good will and common action for the common good, since the conviction had become not only prevalent but generally expressed, that the prosperity of everybody in the region depended upon the prosperity of the anthracite industry.

Basic facts upon which the activities of the business men in the anthracite region were built during the year were pretty thoroughly discussed within the coal fields. Briefly, according to the Anthracite Bureau of Information they were:

Out of the \$475,000,000 which is the approximate value of the annual production of anthracite, more than \$300,000,000 comes back to the region in the form of wages, while about \$100,000,000 more comes back in the shape of taxes, cost of supplies, and incidental operating expenses. The people of the region want to keep that annual income of \$400,000,000. They frankly recognize that the old political argument of an "anthracite monopoly" is out of date along with the belief that nothing could ever put hard coal out of the running. The clear-thinking people in the anthracite counties—and this includes mine workers just as well as coal producers, merchants, and professional men—realize that to-day there can be no such thing as a monopoly in fuel, and that there are hard competitive conditions surrounding anthracite. But they also realize, and their programmes are built upon this, that as a household fuel anthracite is superior to any readily available competitor. They propose to restate to all consumers the advantages of anthracite, and to assure the public that the best fuel in the United States, scientifically mined and carefully prepared, is to be available in continuous supply.

Within the coal region, as elsewhere, there is no tendency to blink the fact that the trade, in 1927, showed a reduction from the previous year, but it was stated that the industry as a whole was efficient and alert. Its mines were never in better mechanical condition than at the close of 1927. It was ready and determined to hold and increase its trade, and to turn out a quality product that would be the best serviced fuel obtainable. The people of the coal region guaranteed sympathy and cooperation in this policy.

In 1927 there were important developments in the local taxation situation. It was shown that, compared with 1913, the labor cost per ton of hard coal in 1927 would indicate an increase of perhaps 200 per cent. In the same period anthracite taxes, excluding Federal taxes, increased from approximately \$5,660,000 to \$28,000,000 a year, about \$7,000,000 of the latter figure being due to the State tonnage tax. Besides the burden of this direct and discriminatory State tax, local taxation for county, school and municipal purposes also showed tremendous advances. There were many properties within the region which showed, within twenty years, more than 700 per cent increase in local taxes. In view of this, a decision by President Judge Fuller, of Luzerne County, in a tax appeal case brought by the Lehigh & Wilkes-Barre Coal Company, was an outstanding event of the year. Most of the local tax increases had been brought about by writing up anthracite valuations in every triennial assessment, and then gradually increasing the mill rates on the increased val-

ations. The coal lands in Luzerne County, for example, were assessed for taxation purposes in 1913 at a little more than \$170,000,000. In 1925 they were returned at \$226,325,865, an increase in valuation alone of about 25 per cent in twelve years. It was from the 1925 assessment, so far as it affected its own properties, that the Lehigh & Wilkes-Barre Coal Company appealed, and Judge Fuller's decision in the initial case was handed down last summer.

This case involved lands aggregating about 580 acres in the town of Ashley, on which a taxable valuation of \$4,448,618 was returned. This was supposed to be 60 per cent of actual market value, that being the ratio presumably used for taxation throughout the county. The company contended that the valuations were excessive, that as returned they were greater than the actual amounts the lands would bring at public sale, and that they had been reached by the erroneous method of estimating the amount of coal in place and applying an assumed value per ton in the ground. Briefly, this meant that in the assessment valuation was reduced to a quantity basis, instead of being determined by applying the test of actual sale value, as the law directs. The decision, based on the testimony of distinguished engineers and the figures realized in actual sales, placed the full value of the disputed properties at \$2,410,405 which, on the basis of 60 per cent for taxation purposes, would make the taxable valuation \$1,446,243, or about one-third of the figure originally returned.

Additional appeals of the Lehigh & Wilkes-Barre Coal Company were pending at the end of the year, and other holders of Luzerne coal properties are in a position to appeal. Indeed, late in December the Lehigh Valley Coal Company and Coxe Bros. & Company, Inc., filed important appeals covering coal holdings in the city of Hazleton. Under the 1925 valuation as returned, coal properties in Ashley were responsible for 68 per cent of the taxes levied. Under the decision of Judge Fuller, even at its face total, coal properties would be responsible for only 52 per cent of the total taxes. The importance of this case, not only in the matter of dollars involved but in its practical political and social implications, is very great. The Supreme Court was still to be heard from, of course, but the Fuller decision seems to be in line with every pronouncement of that court in such cases. The Luzerne County anthracite tax appeals, following, as they do, the important Schuylkill County coal land appeals of three years before, appeared to be writing a new chapter in the tax history of the region and to be pointing the way to relief from excessive local tax burdens.

The importance of the coal mining situation in the United States was recognized by President Coolidge in his message to Congress on Dec. 6, 1927. The President recommended that legislation be enacted authorizing the Federal control of fuel distribution as well as a Federal board of mediation and conciliation in case of actual or threatened interruption to coal mining. The recommendation in full was as follows: "Legislation authorizing a system of fuel administration and the appointment by the President of a board of mediation and conciliation in case of actual or threatened interruption of production is needed. The miners themselves are now seek-

ing information and action from the government, which could readily be secured through such a board. It is believed that a thorough investigation and reconsideration of this proposed policy by the Congress will demonstrate that this recommendation is sound and should be adopted."

CANADIAN COAL INDUSTRY. The total output of coal from some 500 Canadian mines in 1927 was estimated at 17,411,505 net tons, valued at \$61,809,672, or an average value of \$3.60 per ton. This production, which was announced by the Dominion Bureau of Statistics in a preliminary statement subject to revision, may be compared with 16,478,131 tons mined in 1926, with a value of \$59,875,094, or an average value of \$3.63 per ton. In other words, more coal was mined in Canada in 1927 than in any other year previously recorded. The imports of coal amounted to 19,253,088 tons, including 18,314,248 tons from the United States; 928,544 tons from Great Britain; 4818 tons from Germany; 5155 tons from the Netherlands; and 323 tons from Japan. The kinds of coal imported were as follows: anthracite in egg and nut sizes, 3,719,326 tons; anthracite dust, 344,293 tons; bituminous coal, 15,178,640 tons; and lignite, 10,829 tons. The exports of Canadian coal in 1927 were 1,113,330 tons as compared with 1,028,200 tons in 1926. It would appear from these statistics that Canada's coal consumption increased during 1927 by nearly two million tons, the gain being mainly for industrial purposes.

WORLD PRODUCTION OF COAL OF ALL GRADES, 1912-1925*
[U. S. Bureau of Mines]

Year	Production in part estimated (metric tons)	Percentage produced by United States
1912.....	1,249,000,000	35.8
1913.....	1,342,000,000	35.6

* Includes lignite and subbituminous coal as reported, without attempting to reduce to equivalent tonnage of bituminous coal.

WORLD PRODUCTION OF COAL. The world's production of coal and lignite in 1926 was approximately 1,355,000,000 metric tons, practically the same as in 1924 and 1925. The decline in the output of the United Kingdom caused by the great strike of 1926 was largely offset by increases in the other principal producing countries, particularly in Germany and the United States. The output of Great Britain dropped from 247,000,000 to about 127,000,000 tons, while in Germany the output of bituminous coal rose from 132,729,000 to 145,362,000 tons.

The accompanying table presents the information for 1926 and was prepared by the U. S. Bureau of Mines. The figures were taken from such official sources as were available, supplemented by trade information, and were subject to revision, being a preliminary estimate. (See page 209.)

COAL PRODUCED IN THE PRINCIPAL COUNTRIES OF THE WORLD IN THE CALENDAR YEARS
1924, 1925, AND 1926^a

COATES, FLORENCE EARLE. American author and poet, died at Philadelphia, Pa., April 6. She was born at Philadelphia, Pa. in 1850, the daughter of George H. and Ellen Frances Earle, and was educated at private schools in New England and in Europe, and married Edward Horner Coates, Jan. 7, 1879. She was the author of *Poems* (1898); *Mine and Thine* (1904); *Lyrics of Life* (1909); *Ode on the Coronation of King George V* (1911); *The Unconquered Air and Other Poems* (1912); *Poems* (2 vols.) (1916); and *Pro Patria* (1917). She was a contributor to the leading monthly magazines in the United States, and was unanimously elected poet laureate of Pennsylvania by the State Federation of Women's Clubs. She was president of the Browning Society of Philadelphia, 1895-

1903 and 1907-08. She was a founder of the Contemporary Club of Philadelphia, and was connected with many patriotic and other organizations in the United States and Europe.

COCHIN-CHINA, kō'chîn-ch'î'na. The southernmost colony in French Indo-China (q.v.). Area, estimated at 26,476 square miles; population, estimated in 1924 at 4,001,093, consisting chiefly of Annamites, Cambodians, Moïs, Chams, and Chinese, with a few Indians, Malays, Tagals, and foreigners. In 1924 there were 11,439 French and 654 European foreigners. Saigon, the capital, had a population in 1924 of 108,566, of whom 8444 were Europeans, exclusive of 3066 troops. Cholon had a population of 233,270, of whom 122,185 were Chinese. There are about 1134 schools with 2554 teachers and 90,070 pupils.

VALUES OF FOREIGN COINS

Country	Legal standard	Monetary unit	Value in U. S. money	Remarks
Argentine Republic . . .	Gold	Peso	\$0.9648	Currency: Paper normally convertible at 44 per cent of face value.
Austria	Gold	Schilling	1.407	
Belgium	Gold	Belga	1.390	1 belga equals 5 paper francs.
Bolivia	Gold	Boliviano	3.893	12½ bolivianos equal 1 pound sterling.
Brazil	Gold	Milreis	5.462	Currency: Government paper a part of which is legally convertible at 16 pence (= \$0.3244) per milreis; now inconvertible.

Uruguay	Gold	Peso	1.0842	Currency: Inconvertible paper.
Venezuela	Gold	Bolívar1980	
Yugoslavia	Gold	Dinar1980	

The principal product and the largest item of export is rice, over 80 per cent of the cultivable land being given over to its production. The rice crop for 1925 was estimated at 2,215,263 metric tons, of which, 1,095,441 tons were available for export. Other crops are maize, beans, rubber, sugarcane, ground-nuts, tobacco, coffee, fruits, etc. Other sources of wealth are livestock and fisheries, the annual output of the latter being placed at 2,800,000 francs. There are 11 rice mills in Saigon and Cholon which have a daily output of 300 tons of rice. There are also in these cities two sawmills, two soap factories and a varnish factory. Commerce is largely in the hands of the Europeans and the Chinese, although the Annamites are traders on a small scale. During 1924, 749 steamers of 1,599,368 tons entered the port of Saigon and 752 vessels of 1,608,254 tons cleared. The total exports in 1924 amounted to 1,341,336,000 francs and the total imports, 818,656,983 francs. The budget for the year, 1925, balanced at 14,079,850 piastres. Cochin-China is ruled directly by a governor and council of 24 members. It is represented in the French parliament by one deputy.

COGHLAN, SIR CHARLES PATRICK JOHN. First premier of Southern Rhodesia, died at Salisbury, Southern Rhodesia, August 28. He was born in Cape Colony, June 24, 1863, and was educated at St. Aidan's College, Grahams-town, and the South African College, Cape Town. He did not finish his university course on account of his father's death, but went to Kimberley and was employed by his brother, to whom he was articled. He was taken into partnership in 1886, and practiced as a solicitor in Kimberley until he moved to Bulawayo. He was active in local politics, and, after a popular referendum had decided against joining the South African Union, Coghlan became premier of Southern Rhodesia, having been a prime mover in the popular demand for a constitution from the home government. He was knighted in 1910 and created K. C. M. G. in 1925. He was an eloquent speaker and a skillful political leader.

COINS, VALUES OF FOREIGN. The legal estimates of the values of foreign coins on Jan. 1, 1927, as issued by the Secretary of the Treasury are given in the table on page 210.

COKE. Statistics of the United States coke industry in 1926, based on complete returns received by the U. S. Bureau of Mines from producers, are given in the tables (pages 212 and 213). The figures relate exclusively to beehive and by-product coke and do not include the output of petroleum coke, which amounted in 1926 to 995,000 tons, nor of retort or gas-house coke, the sales of which amount to between one and two million tons a year. The figures include installations of by-product coke ovens operated in conjunction with city gas supply, and in this respect differ from the compilations of the U. S. Census Bureau which treat such installations as a part of the city gas industry.

The production of by-product coke in 1926 set a new record and the production of all coke—beehive and by-product—nearly equalled the high marks of 1918 and 1923. The output of by-product coke was 44,376,586 net tons, as

against 39,912,159 tons in 1925, an increase of 12 per cent. The production of beehive coke was 12,488,951 tons, or 1 per cent greater than that of 1925. The production of all coke showed an increase of 9.3 per cent, and amounted to 56,865,537 tons. The year 1926 was further notable for the high percentage of the total output coming from by-product ovens. In spite of the heavy demand for coke, the proportion contributed by the beehive ovens was the lowest on record—only 20.5 per cent of the total. This was a remarkable shift since 1918, when 54 per cent of the supply came from beehive ovens, or even since 1923, when they furnished 34.0 per cent. In a year of active demand the beehive ovens supplied even less than they did in 1921, a year of acute depression.

With the addition of more than 650 new ovens during 1926, the potential coking capacity of by-product plants at the close of the year, at 100 per cent operation and all conditions favorable, amounted to about 50,500,000 net tons. If all of the ovens then under construction were put into operation during 1927, the coke plants would be capable of turning out, at 100 per cent operation, more than 56,000,000 tons. At this rate the plants in existence have a coal-carbonizing capacity of 72,000,000 tons of bituminous coal, which will be later increased to 81,000,000 tons through the addition of new ovens.

The preliminary totals for the calendar year 1927 showed a total production in the United States of 43,921,000 tons of by-product coke and 7,004,000 tons of bee-hive coke. In comparison with 1926 this was a decrease of 1 per cent in by-product output and 44 per cent in beehive production.

COLERIDGE, BERNARD JOHN SEYMOUR COLERIDGE, SECOND BARON. Judge of the British High Court of Justice (King's Bench Division), 1907-23, died at Ottery St. Mary, Devonshire, September 4. He was born Aug. 19, 1851, and was educated at Eton and at Trinity College, Oxford. He was made Queen's Counselor in 1892, and became a bencher of the Middle Temple in 1894. He was justice of the peace and chairman of the Devon Quarter Sessions, and was a member of Parliament for Sheffield (Attercliff), 1885-94. He became a judge of the high court of justice, King's Bench division, in 1907, and was chairman of the coal conciliation board of the Federated Trades, 1912-18. He was elected fellow of the Royal Society of Literature in 1916, and published *The Story of Devonshire House* (1905); and *This for Remembrance* (1925). He retired from the King's Bench Division in 1923 on account of ill health.

COLGATE, AUSTEN. American manufacturer and politician, died at Barnegat Bay, N. J., September 5. He was born in Orange, N. J., Aug. 12, 1863, and was educated at Norwich Academy and Yale College, graduating in 1886. Entering the family business, involving the manufacture of soap and perfumes, he became a director of Colgate & Company in 1896, and later was vice president, a position he held at his death, being in direct charge of production in the Jersey City factory. A member of Troop A of the New York State National Guard, he later became colonel in the New Jersey State Militia, serving on the staff of Governor Fort and of President Wilson when he was Governor of New Jersey. He was many times elected to the New Jersey

COKE

STATISTICAL SUMMARY OF THE COKE INDUSTRY IN 1926

	By-product	Beshive	Total
Coke produced:			
Quantity net tons..	44,376,538	12,488,951	56,865,537
Value	\$250,748,538	\$57,024,869	\$307,773,402
Screenings and breeze produced:			
Quantity net tons..	4,183,453	218,342	4,401,795
Value	\$9,233,229	\$648,193	\$9,881,422
Coal charged into ovens:			
Quantity net tons..	68,646,610	19,224,500	82,871,110
Value	\$247,170,284	\$88,541,691	\$285,711,975
Average value	\$3.88	\$2.00	\$3.45
Average yield in per cent of coal charged:			
Coke	69.7%	65.0%	68.6%
Breeze (at plants actually recovering)	6.6%	2.8%	6.2%
Ovens:			
In existence January 1	11,290	57,587	68,877
In existence December 31	11,716	52,558	64,274
Dismantled during year	183	5,018	5,201
In course of construction December 31	978	978
Coke used by operator in blast furnace or affiliated works:			
Quantity net tons..	31,334,305	1,585,039	32,909,344
Value	\$160,606,129	\$7,148,961	\$167,755,090
Disposal of coke:			
Sold for furnace use to affiliated corporations—			
Quantity net tons..	2,127,176	4,260,028	6,387,204
Value	\$10,955,119	\$20,306,458	\$31,261,572
Merchant sales of furnace coke—			
Quantity net tons..	1,566,980	4,156,032	5,723,012
Value	\$9,800,299	\$16,384,006	\$26,184,305
Sold for foundry use—			
Quantity net tons..	2,163,017	1,163,660	3,331,677
Value	\$16,836,376	\$5,967,936	\$22,804,312
Sold for domestic use—			
Quantity net tons..	5,056,568	386,045	5,442,613
Value	\$37,567,659	\$2,677,741	\$40,245,400
Sold for industrial and other use—			
Quantity net tons..	1,662,837	963,797	2,626,634
Value	\$12,285,212	\$4,638,642	\$16,923,754
Disposal of screenings and breeze:			
Used by operator—			
Quantity net tons..	3,085,770	52,314	3,138,084
Value	\$5,595,796	\$65,034	\$5,660,830
Sold—			
Quantity net tons..	936,292	43,516	979,808
Value	\$3,281,676	\$167,089	\$3,448,765
By-products produced:			
Gas M. cubic feet	706,681,828	706,681,828
Tar gallons..	529,486,374	529,486,374
Ammonium sulphate or equivalent pounds..	1,381,952,369	1,381,952,369
Crude light oil gallons..	164,059,552	164,059,552
Value of by-products sold:			
Gas (surplus)	\$64,686,800	\$64,686,800
Tar	\$14,103,760	\$14,103,760
Ammonium sulphate or equivalent	\$28,128,203	\$28,128,203
Crude light oil and derivatives	\$27,804,976	\$27,804,976

Assembly from Essex County, and in 1912-13 he was a State senator. In 1924 he was a candidate for the Republican gubernatorial nomination, but was unsuccessful. He was a trustee of Colgate University, Hamilton, N. Y., which in 1927 conferred on him the degree of LL.D. He was active in many charitable and philanthropic enterprises in Orange, N. J., and was considered a most public-spirited citizen.

COLGATE UNIVERSITY. A non-sectarian institution of higher education at Hamilton, N. Y.; founded in 1819. In the autumn of 1927 there were 973 students enrolled, and there were 74 members on the faculty. The productive funds amounted to approximately \$4,097,000, and the income for the year to approximately \$396,380. A new dormitory for members of the freshman class was completed in September, 1927, at a cost of \$250,000. A department of personnel and a vocational guidance and placement bureau were established. The library contained 109,000 volumes. President, George Barton Critten, Ph.D., D.D., LL.D.

COLL, CAPTAIN FRANÇOIS. See **AERONAUTICS.**

COLLEGES. See **UNIVERSITIES AND COLLEGES.**

COLLINGWOOD, HERBERT WINSLOW. American editor and author, died at Woodcliff Lake, N. J., October 21. He was born at Plymouth,

Mass., Apr. 21, 1857. He was graduated from Michigan Agricultural College in 1883, and from the University of Wisconsin, with the highest honors in agriculture, in 1912. Michigan Agricultural College conferred on him the degree of LL.D. in 1906. All of Mr. Collingwood's professional career was spent in the editing of agricultural magazines and in writing; he was the editor of *The Southern Live Stock Journal*, 1883-85, of *The Rural New Yorker*, 1885-1900, and editor-in-chief of the latter publication from 1900. His hearing was impaired, and he was greatly interested in measures for the alleviation of the lot of the deaf. Mr. Collingwood wrote: *Andersonville Violets; The Business Hen; Chemicals and Clover; Fertilizer Farming; The Farmer's Garden; The Child; The Story of the Phosphates; The Story of Hope Farm; Hope Farm Notes; Adventures in Silence, and Cape Cod Ramblings.*

COLLINS, THE MOST REV. THOMAS GIBSON GEORGE. Bishop of Meath and premier bishop of the Church of Ireland, died at Bishopscourt, Navan, County Meath, July 3. He was born at Dublin, Apr. 2, 1873, and was educated at Rathmines School and Trinity College, Dublin. He was ordained to the curacy of Maralin in 1896, and became rector of Rathfriland and

Ballyrony in 1902. He held appointments in various parishes, and in 1919 became vicar of Belfast and dean of St. Anne's Cathedral. In February, 1926, he was elected to the Bishopric of Meath.

COLOMBIA. A South American Republic in the northwestern part of the continent. Capital, Bogotá.

AREA AND POPULATION. The area of Colombia is given at 440,846 square miles and the population according to the census of Oct. 14, 1918, 5,855,077; estimated in 1925 by the Colombia Year Book, 7,000,000. The total population was distributed as follows: whites 20 per cent; negroes 5 per cent; Indians, 7 per cent; mulattoes, 18 per cent; mestizos, 50 per cent. The capital, Bogotá, had a population in 1918 of 143,994, and estimated in October, 1923, at 166,148. The country is divided into 14 departments, three intendencies, and six commissionerships. Other important towns with their populations in 1918 are: Barranquilla, 64,543, estimated in 1923, 81,330; Medellín, 79,146, estimated in 1923, 86,641; Cartagena, 51,382; estimated in 1923, 68,119; Cali, 45,825, estimated in 1923, 68,777; and Manizale, 43,203, estimated in 1923, 51,838.

PRODUCTION, MINERAL RESOURCES, ETC. The principal occupations of the country are mining and agriculture. The chief agricultural products are coffee, bananas, cacao, and hides. In the plateau region, of which Bogotá, the capital, is the centre, the chief agricultural products are wheat and coffee. Only a small area of the soil is cultivated although a large part of it is fertile. Absence of adequate transportation prevents production on a large scale. Other important products besides wheat and coffee are tobacco, vegetables, cotton, vegetable ivory, ivory nuts, dyewoods, corn, bananas, and rubber. During the year 1926 there were 331,301,766 coffee trees in bloom, which yielded a crop estimated at 2,700,848 bags of 60 kilos each. Of this amount, 2,454,251 bags were exported, valued at 92,283,862 pesos. Exports of coffee in 1926 exceeded those of the year 1925 by 505,886 bags. By a decree signed on June 4, 1927, the government created in the Department of Industry a new Bureau of Agriculture and Zootechnology. This bureau was to be responsible for everything pertaining to the organization, promotion, and protection of agriculture and livestock, agronomic surveys, and the betterment of agricultural production throughout the country in general.

Colombia is rich in minerals. Gold is found in nearly all the departments and other minerals more or less worked are copper, lead, mercury, cinnabar, manganese, emeralds, and platinum. Colombia produces one-half of the world's output of platinum, most of the remainder coming from Russia. The government operates the emerald mines which produce 90 per cent of the world's supply of emeralds. Many large coal deposits are known to exist but are not exploited to any great extent. In July, 1926, the first shipment of crude oil was made from Colombia. In June, 1927, Colombia's contribution to world petroleum supplies was considered a large factor in making estimates of future world production. During the first four months of 1927 exports totaled 3,329,276 barrels, most of which went to the United States, with smaller amounts for Canada, Cuba, and South American countries. Exploration, experimental drill-

ing, and examination were being conducted throughout potential oil areas in Colombia, but most of the activities are in the Caribbean coast region and the Magdalena Valley. A few of the companies engaged represent Colombian interests. The majority, however, were foreign, about seven American and three British firms being listed. An advance estimate for 1927 gave production at 14,500,000 barrels of crude oil. The shortage of labor in Colombia considerably affects petroleum operations, both directly and indirectly, through the resultant shortage of food and other supplies. Its effect on agricultural development is considered partly responsible for the present high cost of living. Some of the conservative papers were advocating the admission of foreign laborers.

COMMERCE. No later statistics for trade were available than those given in the preceding YEAR BOOK, when the total foreign trade of Colombia amounted to 170,193,089 pesos, of which 85,829,707 pesos represented imports and 84,363,382 pesos represented exports.

FINANCE. In accordance with the treaty of 1922 the sum of \$25,000,000 had been paid to Colombia by the United States during the last five years, in annual installments of \$5,000,000. An official report of the ministry of finance sets forth in the following detail the manner in which this \$25,000,000 had been used:

	Pesos
Bank of the Republic	5,000,000
Agricultural Mortgage Bank	1,000,000
Northern Railway, first section	2,840,817
Northern Railway, second section	2,978,012
Pacific Railway	2,156,264
Tolima-Huila-Caqueta Railway	2,371,538
Carare Railway	659,763
Bolívar Central Railway	817,708
Narino Railway	381,993
Caldas Railway	720,000
Medellín-Cauca River Railway	1,200,000
Bolombolo-Canañastula Railway	550,000
Nacederos-Armenia Railway	246,957
Southern Railway-Fusagasuga extension ..	95,328
Cundinamarca Railway	299,786
Ambalema-Ibagué Railway	99,000
Ibagué-Armenia Railway	38,255
Santander-Pimba Railway	115,520
Aerial cable from Cucuta to Magdalena ..	716,276
Aerial cable from Manizales to Chocó	42,370
Dique Canal	1,080,000
Bocas de Ceniza	1,750,000
Girardot Bridge	185,683
Buenaventura Wharf	569,279
Total	25,859,549

A considerable portion was spent upon railroad construction since the national need of means of communication was most pressing. The first installment of \$5,000,000 was used for an end and in a manner which met with unqualified approval on the part of all Colombians—the establishment of the Bank of the Republic. The foundation of such an institution was one of the recommendations of the American commission of financial experts which visited Colombia upon the invitation of the government in 1923. The initial capital of the new institution was provided by the first installment of \$5,000,000, and its dramatic arrival by airplane stifled an incipient banking and financial crisis and checked a feeling of apprehension which had begun to pervade the business community as a result of the strained financial conditions. The establishment of this institution in July, 1923, marked the post-war resumption of the gold standard by Colombia.

The revenues and expenditures for 1926 balanced at 40,829,248 pesos. The custom house receipts for the same year were 30,469,130 pesos and thus represented about 54 per cent of the total government receipts. The balance of the national debt on June 30, 1927, was 21,388,502 pesos, consisting of 12,466,653 external debt and 8,921,849 internal debt. In October, 1927, the Pan American *Bulletin* reported that the Colombian government had decided to accept the tender of Hallgarten & Co. and of Kissel, Kinnicutt & Co. of New York for a loan of \$60,000,000. The proceeds of this loan were to be used exclusively for completing the Pacific Railroad, the Central Northern Railroad, the continuation of the branch line of the Western Railroad, improvements on the Magdalena River and Bocas de Ceniza, and port improvements.

COMMUNICATIONS. The total length of the railways in Colombia was about 2000 kilometers. The Minister of Public Works at the beginning of the year stated that on the Puerto Wilches railroad 80 per cent of the work to Conchal was completed. A survey of the section from Conchal to Bucaramanga, a distance of 40 kilometers, was completed, so that construction would commence shortly. On the Northern Railroad, it was planned to commence work on a new section, not less than 50 kilometers in length, making Puente Nacional the terminus of the road. It was hoped to have the work completed in four years. In the year 1926 the Pacific Railroad yielded a net profit of 1,800,000 pesos and for 1927 it was expected that the profits would be not less than 2,000,000 pesos. The work of extending the Cundinamarca Railroad was divided into two sections—namely those of Puerto Lievano and La Tribuna. On the latter section, at the beginning of 1927, 1000 workmen were employed, this number having been increased to 2000 in March. Orders for 308,708 pesos' worth of rolling stock for the line were placed in the United States, while additional purchases were made in Colombia for 125,000 pesos.

The Pacific Railroad, which runs from Buenaventura to Zarzal, had been building during the last two years a 57-kilometer extension to the city of Armenia, which recently celebrated the arrival of the railroad within its limits. The new section increased transportation facilities for the fertile region from Quindío to the Pacific and connects many towns of western Colombia with the capital, Bogotá. A road was to be built from Armenia to Ibagué to serve until the railroad was completed between those cities. On September 18, 1927, the Tolima-Huila-Caqueta railroad was opened to public service as far as the city of Natagaima, in the southern part of the Department of Tolima. The inauguration of this line marks an important step toward the completion of this road, which is the continuation of the great main line running from east to west and therefore of vital interest to the economic life of the country.

A bill authorizing the Colombian government to purchase the Santa Marta Railroad, Cucuta-Villamizar Railroad, Cartagena-Calamar Railroad, and the section of the railroad built by the Department of Antioquia, between Bolombolo and the Arma River was made a law in the fall. The government was also authorized to obtain the amount needed from the national budget or negotiate a loan for the purchase of the various railroads.

GOVERNMENT. The executive power is vested in a president elected for four years by direct popular vote, and legislative power in a congress of two houses: the senate of 34 members, elected indirectly, and the house of representatives with 92 members elected by direct popular vote. President in 1927, Dr. Miguel Abadía Méndez, elected Feb. 14, 1926, for the term 1926-30.

HISTORY. At the beginning of the year a part of Colombia was under martial law due to strikes along the Magdalena River. The labor troubles were in the heart of the oil district and threatened to extend to the entire Pacific coast, but prompt government action prevented disorders and the difficulties were smoothed over, although strikes were frequently reported at later dates in the press.

COLORADO. POPULATION. According to the Fourteenth Census, the population of the State on Jan. 1, 1920, was 939,629. The estimated population on July 1, 1927, was 1,074,000. The capital is Denver.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1927	1,646,000	3,107,000*	\$28,267,000
	1926	1,618,000	3,265,000*	27,868,000
Wheat, winter	1927	1,231,000	16,003,000	16,808,000
	1926	1,207,000	14,484,000	15,643,000
Wheat, spring	1927	333,000	5,994,000	5,994,000
	1926	256,000	3,968,000	4,127,000
Potatoes	1927	113,000	16,046,000	8,825,000
	1926	84,000	11,760,000	15,288,000
Corn	1927	1,426,000	22,816,000	15,515,000
	1926	1,496,000	10,472,000	7,435,000
Dry beans	1927	287,000	1,578,000	4,261,000
	1926	350,000	1,050,000	2,940,000
Barley	1927	456,000	10,032,000	5,618,000
	1926	380,000	6,080,000	3,844,000
Oats	1927	189,000	5,481,000	2,631,000
	1926	195,000	4,680,000	2,059,000

* tons.

MINERAL PRODUCTION. Coal production, supplying about one half of the value of the State's mineral output, was somewhat greater in quantity in 1926 than in the year previous, though not quite its equal in value. There were produced 10,637,225 net tons of coal in 1926; in 1925, 10,310,551 tons. Their value for 1926 was \$29,529,000; for 1925, \$30,322,000. Of the chief metals the production was as follows: Gold, as to quantity, 334,339 fine ounces in 1926 and 349,617 fine ounces in 1925; and as to value, \$6,911,405 in 1926 and in 1925 \$7,227,022. Silver, in quantity, 4,624,000 fine ounces in 1926 and 4,506,940 fine ounces in 1925; in value, \$2,885,376 in 1926 and in 1925 \$3,127,816 in 1925. Copper, in quantity, 3,350,000 pounds in 1926 and 2,860,500 pounds in 1925; in value, \$462,300 in 1926 and in 1925 \$335,191. Lead, in quantity, 66,000,000 pounds in 1926 and 62,966,000 pounds in 1925; in value, \$5,478,000 in 1926 and in 1925 \$5,478,042. Zinc, in quantity, 65,000,000 pounds in 1926 and 61,621,000 pounds in 1925; in value, \$4,745,000 in 1926 and in 1925 \$4,683,196. In combined value, the production of these five metals for 1926 totaled \$20,482,081, or \$369,186 less than for 1925. Clay products, valued for 1925, the latest year of available record, at \$4,126,945, furnished with mineral paints and pigments, stone, petroleum and sand and gravel the bulk of the remainder of the State's mineral output. Petroleum production

for 1926 rose sharply, to 2,717,000 barrels, as against 1,220,000 barrels for 1925; in value, \$5,000,000 for 1926 and for 1925 \$1,810,000. For 1925, the entire mineral production of the State had a value of \$63,148,959; for 1924, \$61,487,882.

FINANCE. As reported by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State government in the fiscal year ending Nov. 30, 1926, were \$10,205,575; their rate per capita was \$9.66. They included \$842,897 apportioned for education. Totals not included above, of \$578,273 for interest payments and \$5,046,275 for permanent improvement outlays brought the aggregate of State payments to \$15,830,123. Of this, \$5,590,510 was for highways; \$1,679,991 being for maintenance and \$3,010,519 for construction. Revenue receipts were \$15,295,976; or per capita, \$14.47. Of their total, property and special taxes yielded 44.5 per cent, attaining a per capita rate of \$6.44. Earnings of the departments and compensation paid the State for officials' services supplied 12.9 per cent of revenue; 25.3 per cent was derived from sale of licenses, chiefly on incorporated companies and on motor vehicles, and from a tax on gasoline. Net State indebtedness on Nov. 30, 1926, was \$12,325,370, or \$11.66 per capita. Property subject to ad valorem taxation had a total valuation of \$1,546,830,946. State taxes levied were \$5,076,866, or \$5.37 per capita.

TRANSPORTATION. The total mileage of railroad lines on Dec. 31, 1926 was 5010.60. During 1927 one company built 47.25 miles of first track.

EDUCATION. A new law was enacted for the certification of teachers. According to W. B. Mooney in the *Journal* of the National Education Association, it rendered necessary the qualification of high school graduation plus twenty-five quarter-hours' additional training, for the present; while by 1931 two years' professional training after high school graduation would be needful. According to the State Superintendent of Public Instruction the school population of the State, of ages between 6 and 21, was 301,783 in 1926. The number of pupils enrolled in high schools was 55,754; this total included 20,969 enrolled in junior high schools. Enrollment in the grade schools was 181,123; in night schools, 13,210; and the total public school enrollment, 250,087. The aggregate of investment in public school buildings and grounds was \$54,643,635. There were expended in 1926, for teachers' salaries, \$12,836,208; for other current expenses, of school education, \$5,783,479; for improvements (including furniture), \$5,328,225.

CHARITIES AND CORRECTIONS. The chief institutions maintained by the State for the care or custody of individuals are the State Home for Dependent and Neglected Children, Denver; State Home and Training School for Mental Defectives, Ridge and Grand Junction; Industrial School for Girls, Morrison; Industrial School for Boys, Golden; State Reformatory, Buena Vista; State Penitentiary, Cañon City; State Hospital for the Insane, Pueblo; Soldiers' and Sailors' Home, Monte Vista; Industrial Workshop for the Blind, Denver; and a State Psychopathic Hospital. Prisoners in State penal and reformatory institutions, on Jan. 1, 1927, according to statistics of the Department of

Commerce, numbered 1129; patients in State hospitals for mental disease, 2324.

LEGISLATION. The State Legislature in its regular session convened January 3. It raised the State tax on gasoline from two cents to three cents. It enacted a measure legalizing public boxing bouts of not more than ten rounds and creating a Boxing Commission of three members, appointed by the Governor, for the purpose of regulating boxing matches. A bill to remove from the counties the expense of bringing extradited persons back into the State and placing such expense on the State was passed but was vetoed by the Governor.

POLITICAL AND OTHER EVENTS. Governor William H. Adams and his administration took office January 11. The Moffat Tunnel water bore was holed through February 18, President Coolidge firing the final blast by long-distance electric connection from Washington. The railroad bore was holed through July 7; completed Dec. 10. The cost as measured by indebtedness of the Tunnel Commission was about \$15,000,000 up to the latter part of the year. (See TUNNELS.) Litigation over the seat of Judge Ben B. Lindsey on the Denver Juvenile Court ended adversely to him June 5, in the refusal of the United States Supreme Court to review the order ousting him on the ground of irregularities in his reelection. The ouster order had been issued January 24, by the State Supreme Court. Lindsey took with him on leaving his judicial office a great number of papers relating to cases that he had handled. These he declared not to be of a public nature, and likely to compromise persons of good repute in Denver, in the regulation of whose conduct he had engaged, more or less in his judicial capacity. He burned publicly these papers containing records of some 5000 cases. A strike of coal miners in the State, under the direction of the Industrial Workers of the World, started October 18, and produced disorder at many points. Governor Adams served notice that strike picketing would not be allowed, and a march of I. W. W. forces toward one of the strike centres was later prevented. A special election was held in the First Congress District, comprising Denver, November 15, to fill the place of W. N. Vaile, the deceased Representative. S. Harrison White, former Chief Justice of the State, ran as Democratic nominee, on a platform opposing the Volstead act, and was elected over the Republican pro-Volstead nominee, Francis J. Knauss. The result marked a reversal of the former trend of opinion on prohibition in Denver. Benjamin F. Stapleton was reelected Mayor of Denver on the preferential ballot system, among 15 candidates, receiving a large plurality May 17. A proposal to repeal the preferential voting system was defeated. Englewood voted April 5 for consolidation with Denver. The Denver City Council gave approval to the plan of the Public Service Company of Colorado to bring natural gas to the city from a distance and to sell it at graded rates.

OFFICERS. Governor, William H. Adams; Lieutenant-Governor, George M. Corlett; Secretary of State, Charles M. Armstrong; Treasurer, Herbert C. Fairall (appointed November 10, to succeed Harry E. Mulinix, deceased); Auditor, William D. MacGinnis; Attorney-General, William L. Boatright; Superintendent of Public Instruction, Katherine L. Craig.

JUDICIARY. Supreme Court: Chief Justice, Has-

lett P. Burke; Associate Justices, John Campbell, John H. Denison, Greeley W. Whitford, John W. Sheafor, John T. Adams, Charles C. Butler.

COLORADO, UNIVERSITY OF. A coeducational State institution of higher education at Boulder, Colo.; founded in 1876. The number of students enrolled for the autumn term of 1927 was 2913, and the summer quarter had a registration of 3363. There were 288 faculty members, exclusive of assistants. The total income for general maintenance, from State, fees, tuition, etc., was estimated at approximately \$1,163,213 while approximately \$344,600, including fees, was received for operation of hospitals, and \$184,259 for new buildings. The library contained 182,129 volumes, 17,000 pamphlets and 2500 maps. President, George Norlin, Ph.D., LL.D.

COLORED METHODISTS. See **METHODISTS, COLORED.**

COLUMBIA UNIVERSITY. A non-sectarian institution of higher education; founded in 1754. At Morningside Heights, Broadway and 116th St., New York City, are located: Columbia College (for undergraduate men); the professional schools of law, mines, engineering, chemistry, and architecture; the non-professional graduate faculties of political science, philosophy, and pure science; Barnard College (for undergraduate women); Teachers College, including the departments of education and practical arts; School of Journalism; School of Business; School of Library Service; and the University Library. The College of Physicians and Surgeons is on West 59th Street, the College of Pharmacy on West 68th Street, and the School of Dental and Oral Surgery on East 35th Street. In addition, through university extension and the summer session, courses are offered for resident students at Morningside Heights, and other courses are offered at Camp Columbia, as well as at several extra-mural centres.

On the basis of the enrollment on Nov. 1, 1927, the total number of resident students for the year was estimated at 37,144, distributed as follows: Undergraduates, 3200, of whom 2033 were in Columbia College, 1073 in Barnard College, and 94 in other schools; graduate and professional students, as follows: graduate faculties 2950; law, 812; medicine, 430; mines, engineering and chemistry, 191; architecture, 96; journalism, 146; business, 369; dental and oral surgery, 214; Teachers College, 5740; pharmacy, 829; optometry, 63; library service, 204; unclassified, 195; university extension, 10,732. The grand total is exclusive of 2884 duplicate registrations. Non-resident students, 8907 in number, were distributed as follows: in home study courses, 6258, in special and extra-mural courses, 2649. There were 13,857 registered for the summer session of 1927.

The faculty and officers of administration in 1927 numbered 2210, of whom all except 33 were in active service. This number was distributed as follows: professors, 265; associate professors, 119; assistant professors, 190; associates, 117; instructors, 302; lecturers, 79; assistants, 152; curators, 3; instructors, lecturers and assistants in Teachers College, 183; instructors and lecturers in the College of Pharmacy, 16; instructors in extension and home study, not included above, 375; instructors in

summer session, not included above, 306; officers of administration, 71.

Among the appointments of the year 1926-27 were: Dr. Alfred Owre of the University of Minnesota, to be Dean of the Faculty of Dental and Oral Surgery; Prof. Samuel R. Detwiler of Harvard University and Prof. Philip E. Smith of Stanford University in Anatomy; Prof. George S. Counts of the University of Chicago and Dr. Jesse H. Newlon, Superintendent of Schools of Denver, Colo., in Education; Prof. Robert M. MacIver of the University of Toronto in Social Science; Jerome Michael, a graduate in law, Class of 1912, in Law; Dr. George Hughes Kirby in Psychiatry; Prof. Kenneth J. Saunders of the Pacific School of Religion as Visiting Professor of Comparative Religion; Jules Drach of the University of Paris as Visiting French Professor of Mathematics; Professor Bernard Fay of Paris, Michael I. Rostovtseff of Yale University, Dana C. Munro of Princeton and Sidney B. Fay of Smith College, as Visiting Professors of History; Navarri Tomás of Madrid in Phonetics; Maria de Maeztu of Madrid in Spanish; and George Rowley of Princeton in Chinese Art.

Important events of the year 1926-27 included the substantial completion of the Casa Italiana; the formal visit to the University on October 22, 1926 of Her Majesty, the Queen of Rumania, and the visit of the Lord Bishop of London who received on that occasion the degree of Doctor of Sacred Theology. Action was taken by the Faculty of Law providing for the admission of properly qualified students and graduates of Barnard College to the School of Law as regular candidates for the degree of Bachelor of Laws. The School of Tropical Medicine of the University of Porto Rico, established and maintained with the coöperation of Columbia University, was formally inaugurated on Sept. 22, 1926. The completion on October 7, 1926, of twenty-five years of service by the President of the University was commemorated on March 3, 1927 by the Trustees and on April 19, 1927, by the Faculties. Substantial progress was made in the erection of the new Medical Centre buildings, on Washington Heights, to house the College of Physicians and Surgeons of the University, the Presbyterian Hospital, and other medical institutions.

During 1926-27 the University received 175 gifts in money representing a total of \$2,126,217.78. Among the items in the list of gifts were: \$500,000 from the estate of Annie C. Kane, for the general purposes of the University; \$500,000 to establish the William C. Schermerhorn Memorial Fund; \$416,612.67 from the Carnegie Corporation toward the cost of the new Medical School buildings; \$116,666.67 from Frederick W. Vanderbilt and \$50,000 from Harold S. Vanderbilt, for the new Vanderbilt Clinic; \$73,750 for research in Social Sciences; \$21,500 for social research in France; \$20,000 for research work in legal education from the Laura Spelman Rockefeller Memorial; \$27,450 from the estate of Annie M. McClymonds to establish the Louis K. McClymonds Scholarship Fund; \$27,000 from the estate of S. Whitney Phoenix for the Phoenix Legacy; \$25,000 from the Alumni Fund Committee for the general purposes of the University; \$25,000 from an anonymous donor for a new boathouse; \$25,000 from the estate of Walter B. James to establish the Walter B. James Fellowship Fund; \$25,000 from the Carnegie Cor-

poration for the School of Library Service; \$18,000 from the Borden Company for the Borden Research fund in Food Chemistry and Nutrition; \$15,000 from the Commonwealth Fund for the Psychiatric Commonwealth Clinic Fund; \$15,000 from the estate of Norton Perkins to establish the Edward S. Perkins Scholarship Fund; \$10,000 from Mrs. Honore Gibson Pelton to establish the William Henry Gibson Scholarship Fund; \$10,000 from J. William Clark for the School of Dental and Oral Surgery Building Fund. In addition to the above amounts given to the University proper, Barnard College received \$177,887.15 and Teachers College \$1,194,695.27.

The total endowment amounted to \$62,592,337.56. The estimated value on July 1, 1927, of the University property was \$44,182,860.34. The budget for 1927-28, including not only Columbia University but the affiliated Barnard College, Teachers College, and the College of Pharmacy, was \$12,028,119.26. President, Nicholas Murray Butler, Ph.D., LL.D.

COLVIN, SIR SIDNEY. British art and literary critic, died in London, England, May 11. He was born at Norwood, June 18, 1845, and was educated at home and at Trinity College, Cambridge, where he became a fellow in 1868. He was Slade professor of fine art at Cambridge, 1873-85, and director of the Fitzwilliam Museum, 1876-84. He became keeper of the prints and drawings of the British Museum in 1884, serving until 1912. He received the honorary degrees of M.A. and D.Litt. from Oxford, and that of LL.D. from the University of St. Andrews, and was knighted in 1911. He was a corresponding member of the Institute of France and of the Royal Academy of Belgium. He was honorary fellow of the Royal Society of Painter-Etchers, vice president of the Library Association, and a member of various art societies. He was a careful and enthusiastic lecturer and teacher while at Cambridge, and his work at the British Museum involved a critical revision of the arrangement of the drawings and prints. In 1873 he first met Robert Louis Stevenson, and the friendship between them continued until Stevenson's death in 1894. Colvin became Stevenson's literary executor and edited *The Vailima Letters* and other works. He wrote extensively, his publications including numerous contributions, chiefly on history and criticism of fine arts, made to such periodicals as the *Pall Mall Gazette*, *Fortnightly Review*, *Portfolio*, *Cornhill Magazine*, *Nineteenth Century* and *Edinburgh Review*. He also contributed to the *Dictionary of National Biography* and other standard works of reference. His original writings and works edited include: *Life of Landor* (1881); *Life of Keats* (1887); in Morley's *Englishmen of Letters Series*; *A Florentine Picture-Chronicle* (1898); *Barly Engraving and Engravers in England* (1906); *Drawings by Old Masters at Oxford* (1902-08); *John Keats, His Life and Poetry, etc.* (1917); *Memories and Notes* (1921); *Selections from Landor, in Golden Treasury Series* (1882); *Letters of Keats, in Eversley Series* (1887); Edinburgh edition of R. L. Stevenson's works (1894-97); and *Letters of R. L. Stevenson* (1899 and 1911).

COMBER, BRAXTON BRAGG. Former Governor of Alabama, died at Birmingham, August 15. He was born in Barbour County, Alabama, Nov. 7, 1848, and graduated from the University of

Alabama in 1865. He had extensive farming as well as banking and cotton mill interests, and was a member of the Commoners' Court of Barbour County, 1874-80. He was president of the Alabama Railroad Commission, 1905-07, and Governor of Alabama, 1907-11. He was appointed in March, 1920, a member of the United States Senate to fill the vacancy caused by the death of Senator Bankhead. In 1922 he became associated with Frederick I. Thompson in the publication of the *Birmingham Age-Herald*.

CONGO, BELGIAN. A Belgian colony in Central Africa, formerly the Congo Free State, which was annexed to Belgium in 1908. The boundaries were defined by declarations of August, 1885, and December, 1894, and by treaties with Germany, France, Great Britain, and Portugal. Area, estimated at 909,654 square miles; the native population is placed at 8,500,000 (Bantu). On Jan. 1, 1925, the white population numbered 12,795, of whom 7770 were Belgians. The chief city and former capital is Boma; by a royal decree of 1923, the capital was transferred to Kinshasa, which was renamed Leopoldville. Other important towns are Elizabethville, Stanleyville, and Kookilhatville. Catholic and Protestant bodies carry on missionary work, the number of Catholic missionaries being 888 and of Protestants, 518. In cooperation with the government they supply means of education, and there are several educational institutions under direct government control, at the more important towns. In 1925 the government grant for education to the missionaries amounted to 2,417,000 francs, while the total expenditure on education was 4,285,700 francs.

COMMERCE, FINANCE, ETC. The foreign commerce of the Belgian Congo during 1926 maintained the steady upward tendency that had prevailed since before the World War. Imports increased by more than 20 per cent in volume as compared with 1925, reaching the record total of 632,000 metric tons, valued at 1,291,197,000 francs. For the first time in years there was an arrest in the upward progression of outgoing shipments, due to a transportation crisis which prevented exports from developing normally. However, the volume of exports, totaling 204,000 metric tons, was only slightly lower than that in 1925, while the value was much higher at 729,302,000 francs. Of the principal exports, on a volume basis, raw copper dropped rather sharply in 1926 to 78,983 metric tons, palm oil was stationary, and copal showed a substantial increase. Exports of raw cotton totaled 2179 metric tons, an increase of almost 75 per cent over 1925. Other noteworthy increases occurred in the cases of diamonds, gold, rubber, cacao, and sesame. There was a falling off in outgoing shipments of corn, rice, peanuts, ivory, and a few of the other principal exports. Belgium was, as usual, the principal buyer and principal supplier during the year. In 1925 the revenues were estimated at 146,555,000 francs, and the expend-

iture, 137,086,745 francs. The public debt on Jan. 1, 1925, was 648,997,235 francs. Expenditures as a rule, regularly exceed revenues, with the result that loans frequently have to be resorted to, in order to balance the budget.

Steamers belonging to the government ply on the Congo in the navigable section from its mouth to Matadi, a distance of 95 miles, and government and private companies supply a transport service on the upper Congo and its tributaries. There are over 1000 miles of navigable water between Stanley Pool and Stanley Falls, and above Stanley Falls there is another section navigable for about 585 miles. The tributaries of the Congo are also navigable for part of their courses. There are about 1300 miles of railways and 7500 miles of roads partly suitable for motor traffic.

The Governor-General in 1927 was M. Rutten (appointed Jan. 24, 1923).

CONGO FREE STATE. See CONGO, BELGIAN.

CONGO, FRENCH. See FRENCH EQUATORIAL AFRICA.

CONGREGATIONALISM. A religious denomination founded in the United States by the Pilgrims at Plymouth, Mass., in 1620, under the leadership of Brewster, Bradford, and Winslow. The origin of this movement lay in the Separatist activity in England. The Puritans of Massachusetts Bay followed a similar tendency, and as a result the essential elements of Separatism and Puritanism were combined into Congregationalism. In this denomination each church holds the right to frame its own statement of belief, and the policy of the denomination as a whole represents adaptation to conditions rather than accord with a theory of church government. The National Council, by which the administrative affairs of the church are carried on, has no ecclesiastical authority, but includes ministerial and lay delegates elected by the State Conferences and district associations. The National Council meets biennially, the session in 1927 being held in May at Omaha, Nebraska.

Statistics of the denomination for Jan. 1, 1927, showed 5608 churches, 5671 ministers, and a church membership of 914,698; there were 3005 young people's societies, with a membership of 121,868. The Sunday school enrollment was 769,372. The total raised for all benevolences was \$4,618,660, and the home expenses of the church were \$22,104,535. The national Benevolence Societies of the denomination are the American Board of Commissioners for Foreign Missions and the Congregational Home Boards, consisting of the following seven corporations unified in their operations by the election of an identical Board of Directors for all: American Missionary Association, Congregational Home Missionary Society, Congregational Church Building Society, Congregational Board of Ministerial Relief, Congregational Sunday School Extension Society, and the Congregational Publishing Society. The Annuity Fund for Congregational Ministers provides a participating plan of retiring pensions.

The American Board of Commissioners for Foreign Missions is the oldest foreign missionary society in America, having been organized June 29, 1810. In 1927 it conducted 18 missions in 15 countries; the stations connected with these, missions numbered 109, and the out-stations 1750. The missionaries, holding life appointments, were 662, and included 161 ordained

men, 68 unordained, 217 wives, and 216 single women; in addition, there were 107 associates who serve for shorter periods, making a total of 769 missionaries. Religious services were carried on in 2688 places, where there were 751 organized churches, with 96,353 communicants.

* Includes reports of London Missionary Society and American Board.

* United Church. Comprises Presbyterian, Methodist, and Congregational churches, accounting for increase in totals.

* Repeated from last *Congregational Year Book*.

The total constituency, including church members and all influenced by missions, numbered 234,903; there were 1442 Sunday schools and 79,512 pupils. In the educational field the Board had 37 theological and training schools, with 1804 students, and 7 colleges, with 3243 enrolled, as well as many secondary and elementary schools. In schools of all types there were 94,134 pupils. There were 30 hospitals and 65 dispensaries. Expenditures of the Board for the year ending Aug. 31, 1926, were \$2,152,272.49.

The field of the American Missionary Association extended from the Atlantic Coast and Porto Rico to the Hawaiian Islands. It included in the South and the Southwest the Negroes, the Highlanders, and Spanish-speaking people; in the West the Indians and the Orientals. The statistics of the Association for 1926-27 showed 233 churches; 11,780 members; 33 schools, with 7774 pupils. The expenditures during the same period amounted to \$1,107,242.06.

The Home Missionary Society carried on its work in 1926-27 in 42 states, with 1429 missionaries under commission for the whole or part of the year. The chief foreign work was carried on among the German people, 72 churches and missions using that language in their service. During the year 26 new churches were organized and 36 new church buildings erected. Receipts of the society for the year totaled \$420,196.71. The total receipts of the Church Building Society in 1926-27 were \$628,792.17. The contributions for church buildings amounted to \$179,667.80; repaid grants and sales of abandoned churches to \$39,449.66; and income from other sources to \$125,423.22. The Board voted 265

church grants and loans and paid \$589,901.90 on 121 new churches and 39 parsonages.

The denomination had affiliations with 10 theological seminaries, the more important being: Chicago Theological Seminary; Yale Divinity School; Hartford School of Religious Pedagogy; Oberlin College and Pacific University. In addition, there were 41 colleges, some of which were undenominational, but which had historical relation to Congregationalism.

The headquarters of the National Council are at 287 Fourth Avenue, New York City. In 1927-28 Dr. Ozora S. Davis of Chicago, Ill., was moderator of the Council; the Hon. William E. Sweet, of Denver, Colo., associate moderator; the Rev. Charles E. Burton, New York, secretary; and Edwin G. Warner, New York, treasurer. The Congregational Publishing Society maintains branches at 14 Beacon Street, Boston, Mass., and 19 South La Salle Street, Chicago, Ill. The accompanying table is a reprint from the *Congregational Year Book* for 1926 and shows statistics of international Congregationalism.

CONGREGATIONAL METHODISTS. See METHODISTS, CONGREGATIONAL.

CONGRESS. See UNITED STATES.

CONNECTICUT. POPULATION. According to the Fourteenth Census the population of the State on Jan. 1, 1920, was 1,380,631. The estimated population on July 1, 1927, was 1,636,000. The capital is Hartford.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Hay	1927	370,000	538,000 *	\$11,592,000
	1926	374,000	435,000 *	11,062,000
Tobacco	1927	23,600	28,886,000 *	10,399,000
	1926	21,900	29,346,000 *	10,447,000
Potatoes	1927	15,000	1,685,000	2,698,000

* tons, * pounds.

MINERAL PRODUCTION. The State had a mineral production in 1925 of a total value of \$6,755,454; in 1924, of \$3,129,332. The main products were, in their order of value in 1925, stone, clay products, and lime, none other attaining a total as high as \$500,000.

FINANCE. As reported by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State government in the fiscal year ending June 30, 1926, were \$18,783,941; their rate per capita was \$11.82. They included \$1,614,935 apportioned for education. Totals not included above, of \$53,308 for public service enterprises, \$656,865 for interest payments and \$7,254,551 for permanent improvement outlays brought the aggregate of State expenditure to \$26,748,665. Of this, \$9,676,657 was for highways; \$3,930,887 being for maintenance and \$5,745,770 for construction. Revenue receipts were \$29,599,906; or per capita, \$18.63. Of their total, property and special taxes yielded 28 per cent, attaining a per capita rate of \$5.22. Earnings of the departments and compensation paid the State for officers' services supplied 10 per cent of revenue; 52.3 per cent. was derived from sale of

licenses, chiefly on incorporated companies and on motor vehicles, and from a tax on gasoline sales. Net State indebtedness on June 30, 1926, was \$3,604,377, or \$2.27 per capita. Property subject to ad valorem taxation had a total valuation of \$2,418,096.161. State taxes were levied to the total of \$1,812,963, or \$1.14 per capita.

TRANSPORTATION. The total railway mileage on Dec. 31, 1926, was 967.53. During 1927 one company built 0.55 mile of new first track.

EDUCATION. The system went into effect July 1, whereby only graduates of approved two-year normal schools might be admitted as new teachers into the elementary schools, the superintendent of schools having sole power to nominate teachers. Increase in the number of junior high schools and development of housing for them was reported by A. B. Meredith, Commissioner of Education, in the *Journal* of the National Education Association. As stated by the State Board of Education in 1927, the school population of Connecticut was reckoned to be 371,662 children from 4 to 16 years of age. There were enrolled in the public schools 301,905 pupils, of whom 262,272 were in common schools and 39,633 in high schools. Expenditure in the last preceding school year, for education, was \$32,370,113. The salaries of public school teachers averaged \$1616.

CHARITIES AND CORRECTIONS. The State Department of Public Welfare, created in 1921, comprises two bureaus, the bureau of child welfare and that of adult welfare, and reports also on the penal and reformatory institutions, those for the insane, feeble minded and epileptic, 33 public hospitals, 7 State sanatoria for tuberculosis, town and county almshouses, private homes for the aged and institutions for children. The Department reported for 1924, 534 inmates in the State Prison at Wethersfield; in the State hospital for the insane at Middletown, or on parole, 2768.

LEGISLATION. The General Assembly convened in regular session January 5 and adjourned May 6. The appropriations passed totaled \$42,158,063 for the ensuing two-year period, and for the first time in the history of the State exceeded \$40,000,000. The Legislature followed the recommendation of Governor Trumbull that it avoid increasing the State debt. In consonance with recommendations of the Governor in a special message of April 13, was enacted a law merging the functions of the Board of Control and the Board of Finance and creating a Board of Finance and Control of ten members, seven of them ex officio, having at its head a salaried appointed commissioner. The purpose of this board was the centralization of the State's accounting and budget-making, with a view to economy in the entire field of expenditure. There was imposed a special tax of 4 per cent on gross income of places of amusement of certain specified types, replacing a moving picture tax that had been created by the preceding session.

Receipts of the Motor Vehicle Department were allocated in part to the State Highway Department for expenditure on trunk line highways and on State aid roads. Salaries of court judges, some State commissioners, and sheriffs were increased, and likewise court fees. Changes in the motor vehicle laws included the setting of the age limit for drivers at 16 years; the elimination of the "prima facie" speed limit and the

adoption in its place of a clause limiting driving to reasonable speeds; the increase of the weight limit for trucks to 26,000 pounds. A State Department of Aviation was created to administer the State laws regulating commercial flying. Provision was made for the erection of a building at Hartford for the Motor Vehicle and Highway departments, and for the building of an armory at New Haven and one at Bristol. The State Police was placed under a commission with a single head. A law of 1925 exempting from jury duty those who had served within five years was repealed, but an effort to give women the power to serve on juries failed of passage. Powers under the State right of eminent domain were granted to the Connecticut Light and Power Company. A commission of six was created to revise the general statutes of the State. Armistice Day was made a legal holiday.

POLITICAL AND OTHER EVENTS. Governor Trumbull early in the year advocated the departure from the State's policy not to incur debt for improvements. Later he accepted the plan of a unified Commission of Control and Finance to coordinate and trim expenditure, as a means to obviate a bond issue. A firm of accountants reported to this commission in October that the State agencies had on June 30 cash in excess of immediate demands to a total of \$5,750,146, or about the amount that it had been estimated that the State might have to raise by bond issue. In the matter of clashing State and local rules as to milk supply, the Deputy Attorney General made a ruling setting aside local regulations, these in many cases being stricter than those of the State. The State opposed an effort made in a Federal District Court of South Carolina to compel production of records supplied by an insurance company to one of the Connecticut administrative departments, maintaining the exclusive property of the State in such records. Application was made for the abandonment of the unprofitable trolley line between Meriden and Middletown. Airplane communication by a regular line, with New York and Boston, was begun at Brainerd Field, Hartford, about the end of May.

The New England flood of the first week of November while not at its worst in Connecticut did much damage in the Connecticut River Valley and overflowed a great part of East Hartford. The State authorities opposed the plan of Massachusetts to divert the waters of Swift and Ware Rivers, in Massachusetts, to provide additional water for the Boston supply. Contending that the appropriation of this water as contemplated by Massachusetts statute would diminish the flow of the Connecticut River within Connecticut territory, with detriment to interests there, the State of Connecticut lodged a protest with the Federal War Department, against issue of a Federal permit for the project.

OFFICERS. Governor, John H. Trumbull; Secretary of State, F. A. Pallotti; Treasurer, E. E. Rogers; Comptroller, F. M. Salmon; Attorney General, Benjamin W. Alling.

JUDICIARY. G. W. Wheeler, Chief Justice; John K. Beach, H. J. Curtis, W. M. Maltbie, John E. Keeler, F. D. Haines, G. E. Hinman, Associate Judges.

CONSUMERS' SOCIETIES. See COÖPERATION.

COOK, ALBERT STANBUBROUGH. American scholar, and professor emeritus of English language and literature at Yale University, died at New Haven, Conn., September 1. He was born at Montville, N. J., Mar. 6, 1853, and graduated from Rutgers in 1872 with the degree of B.S., receiving that of M.S. in 1875. After serving as tutor of mathematics at Rutgers and as teacher in the Freehold, N. J., Institute, he studied in Europe at the Universities of Göttingen and Leipzig, returning to the United States in 1879 as associate in English at Johns Hopkins University. He studied at Jena, 1881-82, receiving the degree of Ph.D. in the latter year, and returned to the United States to become professor of English at the University of California. He served there until 1889, when he went to Yale as professor in English language and literature, a chair he held until 1921, when he was made professor emeritus. His scholarship was recognized by honorary degrees, including the honorary M.A. from Rutgers in 1882 and from Yale in 1889; L.H.D. in 1889 and LL.D. in 1906 from Rutgers; and Litt.D. from Princeton in 1918. He was active in professional and literary associations, being president of the State Teachers' Association of California in 1887, of the Modern Language Association of America in 1897, and of the Concordance Society, 1906-25. He was a member of the Netherlandish Society of Letters of Leyden, and served as secretary of the National Conference on entrance examinations in English, 1897-99. He was coeditor for English of *Journal of English and German Philology*, 1897-1905, and founded the annual prizes in poetry at Yale and the University of California. He was editor of the *Yale Studies in English* (70 vols.) which were published after 1898, and he contributed extensively to the journals of learned societies. His writings include: *The Art of Poetry* (1892); *The Bible and English Prose Style* (1892); *First Book in Old English* (1894); *The Artistic Ordering of Life* (1898); *The Higher Study of English* (1906); *The Authorized Version of the Bible and Its Influence* (1910); *The Possible Begetter of the Old English Beowulf and Widsith* (1922); *The Old English Andreas and Bishop Acca of Hexham* (1924); *The Aims in the Teaching of English Literature* (1925); and *Cynewulf's Part in our Beowulf* (1925).

COÖPERATION. If one idea has taken universal hold on our modern industrial world, it is that of the coöperative society. It has many phases; there are the coöperative stores, credit societies, building and loan associations, insurance groups, agricultural pools, artisans' and labor productive societies. Local societies are banded together sectionally and nationally. There was in existence in 1927 an international wholesale society, an international educational society and a women's international guild. In some countries from 45 to 40 per cent of the population was being reached through consumers' coöperative organizations. In an examination of thirty-five countries* made by the U. S. Federal

* Argentina, Australia, Austria, Belgium, Bulgaria, Canada, Ceylon, China, Czechoslovakia, Denmark, Egypt, Estonia, Finland, France, Germany, Great Britain, Greece, Hungary, India, Japan, Latvia, Malay States, Netherlands, Norway, Palestine, Poland, Portugal, Rumania, Russia, South Africa, Sweden, Switzerland, Ukraine, United States, Yugo-Slavia.

Bureau of Labor, statistics showed there were operating in those countries 300,000 societies with a combined membership of more than 44,500,000 persons.

The consumers' cooperatives alone number 50,000 societies in 22 countries, with a membership of 27,000,000 persons and yearly sales of over five and one-half billion dollars. A single fact such as the following is of startling significance: The English Coöperative Wholesale Society was the largest manufacturing, trading, and land-owning unit in the United Kingdom. The following table indicates how important are the consumers' coöperative societies in some countries of the world:

PER CENT OF POPULATION SUPPLIED
THROUGH CONSUMERS' COÖPERATIVE
SOCIETIES

	Per cent
United Kingdom	45
Denmark	40
Finland	40
Hungary	40
Iceland	85-40
Switzerland	85
France	80
Russia	80
Belgium	20
Germany	20
Sweden	20
Norway	15
Netherlands	10
Bulgaria	8
Australia	6
United States	2.5
Argentina	1

In Great Britain there were 1825 consumers' coöperatives with 5,017,464 members, in Denmark 5148 societies with 865,002 members, in France 4131 with 3,111,322 members, in Germany 50,181 with 3,382,011 members, in India 61,016 with 2,508,827 members, in Russia 78,865 with 19,129,033 members, in the United States 12,149 with 2,815,230 members. In various countries various types of societies have been developed more rapidly than others. In Great Britain and the United States the consumers' coöperatives lead all the rest. In Germany the credit society had flourished mightily; and in Denmark the agricultural society led. France and Italy were the homes of workmen's productive groups, and while in Italy these had been destroyed by the Fascist régime, in France they still prospered.

An examination of the membership and sales of local consumers' societies for the most successful countries in which the system is in operation (compared with the United States) would indicate the following:

Country	Average membership per society	Average yearly sales per society	Average yearly sales per member
Belgium	5,004	\$357,385	\$71
Great Britain	3,810	687,764	181
Germany	3,218	189,536	48
Australia	2,838
United States	810	105,543	354

In some countries the wholesale coöperative had advanced rapidly, as well. The Coöperative Wholesale Society of Great Britain, in 1926, did \$366,409,652 worth of business, the Scottish Coöperative Wholesale Society \$81,357,767, the Russian Wholesale Coöperatives (1925) \$117,981,324, the German (1926) \$70,013,405, the

Danish (1925) \$34,936,371. In England alone (1925) the Wholesale Coöperative manufactured goods to the value of \$137,496,185. The following were the commodities produced by this organization: Flour, provender and oil cake, biscuits, confectionery, butter, cheese, margarine, lard, bacon, preserves, pickles, vinegar, yeast, tea, coffee, cocoa, chocolate, drugs and chemicals, tobacco and cigars, cotton and woolen cloth, hosiery, clothing (including outer clothing, underwear, shoes, corsets), leather and leather bags, furniture, hardware, cutlery, bicycles, motor vehicles and motor cycles, scales, brushes, mats, soap, paints, harness, trunks, picture framing, printing and bookbinding, china, earthenware and pottery, oils, lumber and its products, bottles, and coal.

Certain international phases of the movement are worthy of attention. There was in existence an International Women's Coöperative Guild made up of the wives of coöperators. In 1886 there was formed the International Coöperative Alliance, which, since 1910, had limited itself exclusively to consumers' coöperative societies. One of the chief principles of the Alliance is publicity and propaganda on behalf of the movement. In 1924 there was formed an international coöperative wholesale society. In 1927 the membership totaled 26 national wholesale societies. In 1926 these societies imported from one another goods to the value of \$94,561,210. England led with \$75,695,317, Germany was next with \$6,416,563. The others were not significant.

Another interesting phase of the coöperative movement was disclosed in an investigation by the International Economic Conference (League of Nations). This showed that in certain countries agricultural coöperative organizations played very important roles in international trade. In 1925, 54.3 per cent of Latvia's bacon exports were handled by coöperatives; in 1925, 50 per cent of Russia's egg exports were handled similarly; in 1925-26, 66.7 per cent of Canada's wheat exports were thus handled; in 1926, 90 per cent of the United States' raisin crop was raised by coöperatives; in 1924-25, 85 per cent of South Africa's tobacco crop was exported by coöperatives, and during 1925 or 1926, the butter exports of the following countries were handled in the proportions indicated: Finland, 70-80 per cent; New Zealand, 92 per cent; Latvia, 90 per cent; Russia, 100 per cent. See AGRICULTURE; HORTICULTURE; AGRICULTURE, U. S. DEPARTMENT OF.

BUILDING AND LOAN ASSOCIATIONS. At the July, 1926, meeting of the League of Local Building and Loan Associations of the United States the following figures were made public as to the status of the building and loan associations for 1924-25.

Total number of associations	12,408
Total number of members	9,886,997
Total assets	\$5,509,176,154
Total mortgage loans	5,085,009,639

In New Jersey, Ohio, and Pennsylvania the associations were particularly popular. Of the total number New Jersey had chartered 1410, Ohio 865 and Pennsylvania 4440. Among these three there were total assets of \$2,483,100,000 and total mortgages outstanding of \$2,290,000,000.

At the 1927 meeting the following were the

figures made public for 1925-26. It will be seen that in the single year membership increased 8 per cent and assets 15 per cent. In the one year mortgage loans of \$1,945,000,000 were made.

Total number of associations	12,626
Total number of members	10,665,705
Total assets	\$6,334,103,807
Total mortgage loans	5,851,689,591

LABOR BANKS. The accompanying figures will be of interest to students of the labor movement. They are the work of the research department of the Amalgamated Clothing Workers of America (published in the *Monthly Labor Review*), and show the status of labor banks as of Dec. 31, 1926. During 1926 the Brotherhood of Locomotive Engineers Coöperative Trust Co., (N. Y.) was sold to private parties and the Brotherhood Savings and Trust Co. (Pittsburgh) discontinued business. These, however, were replaced in the field by the Gary Labor Bank and the Brotherhood National Bank (San Francisco).

It should be further noted that from Jan. 1, 1927, to June 30 three more Labor banks left the list, viz., The Brotherhood of Locomotive Engineers Title & Trust Co. (Philadelphia), The Brotherhood of Locomotive Engineers Bank and Trust Co. (Birmingham, Ala.)—both of which sold out to private interest—and the Brotherhood State Bank (Kansas City) which was no longer being controlled by labor.

Progress in this branch of labor coöperative activity has not been rapid. In the last six

months of 1926 the surplus and profits of all the labor banks increased 0.4 per cent, deposits 1 per cent, and resources 0.4 per cent.

INTERNATIONAL COÖPERATIVE CONGRESS. The twelfth congress was held in Stockholm Aug. 15-18, 1927. Some 424 delegates attended from 28 countries. The most important action taken by the congress was the passage of a resolution urging upon the constituent societies the necessity for development independent of private capital and pointing out the wastefulness of duplicate effort in the same localities. The point made was the unity of coöperation the world over. Said the resolution: "Experience has shown that the coöperative organizations which have developed their activities with coöperative capital, and have avoided dependence on banks and other financial institutions, have been able to overcome even those crises which have had such a paralyzing effect on enterprises dependent on credit." Other resolutions were aimed at closer coöperation between consumers' and agricultural coöperatives and the development of coöperative banking. There were others passed favoring free trade, and expressing abhorrence of all militarism. A resolution to treat with the Amsterdam International and the Moscow International on topics mutually important to trade unionism and coöperation was voted down. A central committee of 57 members, representing 23 countries, was elected. Dr. James P. Warbasse was reelected United States representative. Vienna was chosen as the seat of the next congress, 1930.

STATISTICS. The U. S. Bureau of Labor Statistics, in the spring of 1927, published an impor-

CONDITION OF LABOR BANKS IN THE UNITED STATES AS OF DEC. 31, 1926

Name of bank and location	Surplus and profits	Total deposits	Total resources
Mount Vernon Savings Bank,* Washington, D. C.	\$144,208	\$4,237,402	\$4,825,218

* Statement as of June 30, 1926.

* Statement as of Dec. 1, 1926.

* Statement as of Nov. 23, 1926.

tant summary of the growth of the coöperative movement (other than agricultural) called *Co-operative Movement in the United States in 1925*. The following facts may be summarized:

1. In 1925 the total coöperative membership was 700,000, the business done was \$300,000,000, and several million people were reached.

2. The Middle West has been the seat of the greatest development of the consumers' coöperatives. Credit unions, which had their greatest growth since 1920, developed largely in the East.

3. The workers' productive societies have shown the smallest growth. In 1925, these societies did a business of \$9,000,000. Some 4500 persons had membership in them.

4. The credit coöperatives have developed more rapidly than the regular consumers' societies. In 1925 these made loans of more than \$20,000,000 and had a membership of 170,000 persons.

5. The housing coöperative societies have made their appearance, for the most part, in New York City. These groups have provided dwellings for 1805 families and own \$4,000,000 in property.

6. The consumers' societies appear to have weathered successfully the hard times that followed 1920. In 1925 nearly 25 per cent of these had sales of \$100,000 or more. Nearly three-fourths of them showed profits for the year (average 3.9 per cent on sales). The societies have been putting their money into reserves, instead of dissipating it in the form of dividends,

as shown by the fact that the reserves of the societies total more than half of the paid-in share capital. Three-quarters of a million dollars in dividends were distributed to members.

7. The coöperative wholesale business appears to have been abandoned.

8. An attempt is being made to link the individual societies through the medium of district leagues. In 1925 four were in existence.

The Bureau gained its information via the questionnaire method. Of the 2066 societies known to be in existence in 1925, 708 reported. The following shows the existence of the societies by geographical divisions:

PER CENT OF TOTAL COÖPERATORS
[By geographical divisions]

	Consumers' societies	Credit and workers' societies
New England	18.9	48.2
Middle Atlantic	10.8	45.4
East North Central	29.0	1.5
West North Central	27.2	.5
South Atlantic	1.0	1.9
East South Central5	.7
West South Central	1.3	.9
Mountain8	...
Pacific	11.1	.9
Total	100.0	100.0

The accompanying tables extracted from the report throw light on the movement.

NUMBER OF COÖPERATORS IN EACH GEOGRAPHICAL DIVISION AND RATE PER 10,000 OF POPULATION

Geographical division	Estimated population, July 1, 1923	Coöperative membership, 1925				Total	
		Consumers' societies		Credit and workers' societies			
		Members	Rate per 10,000 of population	Members	Rate per 10,000 of population		
New England	7,707,979	26,605	34.5	53,008	68.8	79,613	103.8
Middle Atlantic	23,322,950	14,507	6.2	49,902	21.4	64,409	27.6

* Data not available.

* Surplus and reserve.

Workers' Productive Societies. The Bureau of Labor was able to reach 21 out of the total 39 societies known to be functioning. Some of these societies partake more of the nature of trade-union or joint-stock enterprises, and, unlike the regular cooperatives, have employees who do not share in the profits. These societies average 10 years of existence. In the 21 societies reporting, there were 2438 shareholders. Of these, 465 were employed in the factories operated by the societies, while these employed 807 employees who were non-shareholders and therefore did not participate in the profits. The 21 societies reporting had a paid-in share capital of \$1,015,509 with a surplus and reserve of \$653,500. It is interesting to note the activities engaged in. There were 4 cigar factories, 3 fish canning and sales societies, 2 window glass factories, 2 laundries, 6 shingle mills, 1 pottery, 2 shoe factories, 1 veneer factory. Of these, 19 reported a business done of \$4,533,329 in 1925. There was no advance, in view of the fact that in 1920, 9 societies reported a business of \$3,834,692.

Consumers' Societies. The accompanying tables indicate the status of this type of the movement

in 1925. There was a total of 479 societies reporting, of which the retail-store societies were 431 or 90 per cent of the total. For the 423 retail-store societies, the average life has been 10 years and 1 month, while the other societies have had a life of 6 years and 4 months as the average. See HORTICULTURE.

COÖPERATIVE MARKETING. See AGRICULTURE, U. S. DEPARTMENT OF.

COPPER. The outstanding features of the American copper industry in 1927, according to the U. S. Bureau of Mines, Department of Commerce, were a relatively maintained production, a decrease in imports of refined copper, an increase in exports of metallic copper, a decrease in total stocks and a falling off in domestic withdrawals.

The average quoted price of the metal for the year, according to the American Metal Market, was 13 cents a pound, with a marked advance during the last two months following a depression in mid year. Stocks of refined copper available for consumption were 22,000,000 pounds larger at the beginning of 1927 than at the beginning of 1926. The small drop in refined copper output and the decrease in imports of refined copper made less copper available for consumption and, together with the increase in

refined copper exported, entirely offset the decrease in domestic withdrawals. Therefore, the increase in stocks of refined copper in 1927 was relatively the same as in 1926, approximately 22,000,000 pounds.

The smelter production of copper from domestic ores in 1927 as determined by the Bureau of Mines from reports of the smelters showing actual production for 11 months and estimated production for December, was 1,698,000,000 pounds, compared with 1,740,000,000 pounds in 1926. The 1927 production was 2.5 per cent less than that of 1926, but, with the exception of 1928, was the largest peace-time production on record. The estimated smelter production from domestic ores for December, as reported by the smelters, was 145,000,000 pounds which was 4,000,000 pounds higher than the average for the 11 months preceding.

The production of new refined copper from domestic sources, determined in the same manner as smelter production, was about 1,739,000,000 pounds, compared with 1,731,000,000 pounds in 1926. In 1927 the production of new refined copper from domestic and foreign sources amounted to about 2,318,000,000 pounds, compared with 2,322,485,000 pounds in 1926, a decrease of nearly 4,500,000 pounds or .2 per cent. The production of secondary copper by primary refineries decreased from 225,118,000 pounds to about 216,000,000 pounds in 1927, or 9,000,000 pounds, so that the total primary and secondary output of copper by the refineries was a little over .5 per cent lower in 1927 than in 1926, being about 2,534,000,000 pounds compared with 2,547,603,000 pounds.

Refineries reported that at the end of 1927 approximately 168,000,000 pounds of refined copper was in stock, an increase from 146,000,000 pounds at the end of 1926. It was estimated that stocks of blister copper at the smelters, in transit to refineries, and at refineries, and materials in process of refining, would be about 380,000,000 pounds on December 31, compared with 455,000,000 pounds at the end of 1926, a decrease of 75,000,000 pounds. Therefore, a decrease of 53,000,000 pounds in total smelter and refinery stocks was indicated.

The quantity of new refined copper withdrawn on domestic account during the year was about 1,442,000,000 pounds, compared with 1,570,000,000 pounds in 1926, a decrease of 128,000,000 pounds or approximately 8 per cent. However, domestic withdrawals in 1927, with the exception of those in 1926, were larger than those of any other peace-time year. The method of calculating domestic withdrawals is shown by the accompanying table.

The imports of copper into the United States in 1927 amounted to 718,331,990 pounds valued at \$84,965,364, as compared with 779,441,797 pounds valued at \$99,741,809 in 1926. During 1927 the United States imported 168,914,641 pounds of copper ores, concentrates and matte, valued at \$18,997,355, as compared with 153,594,877 pounds valued at \$19,065,075 in 1926. These imports included copper ores amounting to 99,328,373 pounds on the basis of copper content, valued at \$10,759,637 and concentrates amounting to 68,192,800 pounds valued at \$8,106,626. Canada, Chile, Mexico and Cuba, in the order named, supplied this material. Unre-

finer copper consisting of black, blister and converter copper in pigs, bars etc., was imported to the amount of 438,594,013 pounds, valued at \$51,954,453, as compared with 443,798,297 pounds valued at \$56,101,041 in 1926. This was received in 1927 from the following countries: Peru, 101,870,992 pounds; Africa, 117,189,443 pounds; Mexico, 82,974,970 pounds; and Chile 63,697,974 pounds. Refined copper to the amount of 103,279,082 pounds valued at \$13,105,086 was imported, of which 100,839,354 pounds valued at \$12,785,696 was received from Chile in 1927, and 2,439,728 pounds, valued at \$319,390 from other countries. This was a reduced amount from 1926 when Chile furnished 166,872,641 pounds of copper that were valued at \$22,884,487.

In 1927 the United States exported refined copper in ingots, bars and other forms, to the amount of 922,466,143 pounds, valued at \$125,368,316, as compared with 856,124,528 pounds, valued at \$121,231,224 in 1926. Germany was the largest consumer in 1927, taking 221,841,647 pounds as compared with 153,360,480 pounds in 1926. The United Kingdom took 182,565,499 pounds as compared with 180,320,237 in 1926, while France reduced its consumption, taking 111,958,106 pounds in 1927 as compared with 175,150,816 pounds in 1926.

In 1927 there were exported copper rods to the amount of 58,403,112 pounds, valued at \$8,849,487, copper wire amounting to 10,445,569 pounds valued at \$1,710,151, insulated copper wire and cable, 22,555,445 pounds, valued at \$5,171,579, and other forms, including scrap, 92,036,150 pounds of copper that were valued at \$8,774,684.

The world's production of copper in 1926 made a record and was estimated at 1,628,000 tons, of which the United States produced 54 per cent of the total, Chile 14 per cent, and Africa, principally Belgian Congo, 7 per cent, these major producing countries accounting for three-quarters of the world's output. For 1927 it was estimated that the production would be slightly larger.

In South America considerable development was under way. Here the copper production in 1926 was about 274,000 tons or more than three times that of 1913. Most of the large plants were being improved in 1927.

While the Chile Copper Co., the leading producer of Chile, was equipped in 1927 so that it could turn out copper at the rate of 375,000,000 pounds per annum, this amount was not approached in 1927, when the production was about 220,000,000 pounds. This company was constantly improving its plant and equipment, recent improvements representing an investment of \$17,000,000. The Andes Copper Mining Company was equipped for more efficient handling of ores, as were other companies in Chile. Chile's copper production for 1927 was estimated at about 520,000,000 pounds.

The mines and plant of the Union Minière du Haut-Katanga were being extended during the year and a new reverberatory furnace plant was constructed at Panda while additional leaching equipment was being supplied. This construction work caused the transfer of mine labor to building so that the Union Minière was producing about 90,000 tons of copper. It was anticipated that with the new furnace in operation an output of 120,000 tons could be secured which the new leaching plant would increase to 150,000 tons per annum. During the year active work was done towards the completion of the Bas Congo and Lobito Bay Railway which would make possible the exploitation of the western group of mines, including the Mussonoi.

See also CHEMISTRY, INDUSTRIAL; METALLURGY.

COPYRIGHT. Registrations for the fiscal year 1926-27, according to the report of the U. S. Register of Copyrights, numbered 184,000, as compared with 177,635 for the preceding year. Of these 77,136 were classed as books, but included pamphlets, leaflets, and contributions to periodicals, those printed in the United States numbering 72,003, those printed abroad in a foreign language, 3,777, while the remainder, 1356, were English books registered for ad interim copyright. The chief classes of the remaining registrations, in order of numerical importance, were: Periodicals, 41,475; musical compositions, 25,282; prints and pictorial illustrations, 14,833; photographs, 7415; dramatic or dramatico-musical compositions, 4475; works of art, including models or designs, 2575; maps, 2677; drawings or plastic works of a scientific or technical character, 1229; and motion picture photoplays, 4475. The renewals numbered 4686, as compared with 4029 in the preceding year. The fees paid during the year amounted to \$184,727.60. The total number of articles deposited from July 1, 1897, to June 30, 1927, was 6,303,639.

The gross receipts of the Register's office for the fiscal year were \$191,376.16; the total expenditure for salaries, \$165,552.16; and for supplies, \$1057.72. The year's business showed a substantial increase over that of 1926, which was the largest in the history of the office up to that time.

No copyright legislation was enacted during the fiscal year, except the Act of July 3, 1926, permitting copyright for "works printed or produced in the United States" by other processes than typesetting, photo-engraving or lithographing. Two proclamations were issued during the year, namely, in behalf of citizens of Poland, Feb. 14, 1927; and Czechoslovakia, Apr. 27, 1927. In both cases protection with respect to mechanical reproduction of music under Sec. 1 of the Copyright Act of 1909 is included.

CORN. Reports on corn production in 1927, made by 15 countries to the International Institute of Agriculture, Rome, indicated a total yield of 3,143,960,000 bushels as compared with 3,190,423,000 bushels produced by these countries the year before. The crop of 1927 was about 1½ per cent under the production of 1926 and about 3½ per cent below the average yield for the five years 1921-1925. The acreage for 1927 reported by these countries, 121,598,000 acres, was .5 per cent below their acreage for 1926 and 1.8 per cent below the average acreage of the five-year period mentioned. The production in 1927 reported by some of the leading corn growing countries was as follows: Rumania 145,475,000 bushels, Italy 85,556,000 bushels, Jugoslavia 76,629,000 bushels, Hungary 60,298,000 bushels, Spain 24,749,000 bushels, France 21,511,000 bushels, and Bulgaria 20,613,000 bushels. The estimate for Italy does not include the production in that country of early corn known as "cinquantino" of which about 4,230,000 bushels were produced in 1926. For the crop year 1926-27 the more important corn producing countries in the southern hemisphere reported the following yields: Argentina 320,853,000 bushels, Brazil 164,336,000 bushels, Java and Madura 82,280,000 bushels, and the Union of South Africa 68,193,000 bushels. The Canadian yield of 1927 was estimated at 4,355,000 bushels, as compared with 7,815,000 bushels in 1926 and the average of 12,974,000 bushels for the five years 1921-1925. The corn acreage in Canada showed a marked reduction from 293,000 acres, the average for the five-year period 1921-1925, to 210,000 acres in 1926 and 132,000 acres in 1927. The important factor in this reduction was the spread of the European corn borer in the Province of Ontario, where most of the corn is grown.

The corn production of the United States, according to estimates made public by the Department of Agriculture on Dec. 19, 1927, was 2,786,288,000 bushels on 98,914,000 acres, or at the rate of 28.2 bushels per acre. The preceding year the total yield was 2,692,217,000 bushels, the area 99,713,000 acres, and the average acre yield 27 bushels. The average farm price Dec. 1, 1927, was 72.3 cents per bushel, which was 8.1 cents above the corresponding price the year before. The total value of the crops for the two years at these prices was \$2,014,725,000 in 1927 and \$1,729,457,000 in 1926. The yields in the highest producing states in 1927 were reported as follows: Iowa 399,566,000 bushels, Nebraska 291,446,000 bushels, Illinois 254,070,000 bushels, Kansas 176,910,000 bushels, South Dakota 134,995,000 bushels, Indiana 132,453,000 bushels, and Minnesota 127,246,000 bushels. The highest acreages reported were as follows: Iowa 10,947,000 acres, Nebraska 8,805,000 acres, Illinois 8,469,000 acres, Missouri 5,953,000 acres, and Kansas 5,897,000 acres. The average yield per acre ranged from 14 bushels in Georgia to 44 bushels in Maryland. In Massachusetts and New Hampshire the average yield per acre was 41 bushels, and in New Jersey 40 bushels, while in all other states it was under 40 bushels.

In the different states the average farm price per bushel on Dec. 1, 1927, ranged from 67 cents in South Dakota to \$1.20 in Massachusetts, Rhode Island and Connecticut. These prices were generally highest in the Atlantic and Pacific Coast and the Southwestern States.

There was an increase of only 3 per cent in the corn production of the country as a whole over the yield of 1926, although in the Western Corn Belt States the increase was 25 per cent, in the Rocky Mountain and Pacific Coast States 45 per cent, and in the 11 Cotton States 3 per cent over last year's large yield. These increases were largely offset by decrease of 22 per cent in the Eastern Corn Belt States, and of 10 per cent in the North Atlantic States. About 69 per cent of the 1927 crop was produced in the 12 Corn Belt States, as compared with 68 per cent the year before. Although the crop of 1927 was late in maturing and remained a great uncertainty during the critical fall period, weather conditions—including the absence of injurious frost—were so favorable that the crop ripened quite well and in quality was better than the crop of 1926, and was only $5\frac{1}{2}$ points below the ten-year average. It was estimated that about 75.2 per cent of the crop was of merchantable quality, as compared with 72.6 per cent in 1926 and 80.7 per cent of the average for the past ten years. The total supply of corn on Nov. 1, 1927, including the year's crop and the stocks on hand placed at about 111,000,000 bushels, was estimated at approximately 2,885,000,000 bushels, which, with the exception of 1924 and 1926, was the smallest supply at the beginning of the crop year since 1919.

Although the United States produces about two-thirds of the world's corn crop, exports from the country during the past five years have been relatively small. For the year ended June 30, 1927, the exports were 17,563,000 bushels of grain, 564,000 barrels of corn meal, and 9,446,000 pounds of corn products for table use. The imports of the same period amounted to 1,093,000 bushels of grain. The home market is influenced by the supplies available in Europe and Argentina. During the calendar year 1927 Argentine corn, which largely goes to meet European requirements, was in position at times to compete in United States markets and about 2,657,000 bushels entered the country during the nine months ending with September, the greater portion arriving from July to September when domestic prices were relatively high.

The results of studies made by the U. S. Department of Agriculture pointed out that in the United States the average yield per acre of corn had increased 18 per cent since 1885, and the average annual production about 440,000,000 bushels as the result of this higher acre yield. During this period the average yields increased from six to ten bushels in the East North Central States and from nine to fourteen bushels in the northern section of the South Atlantic States. The cost of producing corn in 1926, based on 5120 reports, was \$23.10 per acre and 70 cents per bushel, the range per acre being from \$18.28 in the West North Central States to \$42.70 in the North Atlantic States, and the range per bushel from 61 cents in the East North Central States to 93 cents in the Rocky Mountain and Western States. An outstanding activity in connection with corn culture during the year was the European corn borer control campaign vigorously conducted in the infested areas. (See ENTOMOLOGY, ECONOMIC.) Reduced yields resulting from borer injury were regarded as largely due to weakened plants and premature ripening rather than to destruction of the

stalks. The control of the corn borer, through the extra labor required in growing corn, raises the cost of production and introduces a new problem into the methods of farm management.

In the interstate husking contest held near Blue Earth, Minnesota, Fred Stanek of Iowa took the championship for the third time. See AGRICULTURE.

For use of corn stalks, see CHEMISTRY, INDUSTRIAL.

CORN BORER. See AGRICULTURE; AGRICULTURAL EXTENSION WORK; CORN; ENTOMOLOGY, ECONOMIC.

CORNELL UNIVERSITY. A non-sectarian, coeducational institution of higher education at Ithaca, N. Y.; founded in 1865. There were 5355 students enrolled in the autumn session of 1927, distributed as follows: graduate school, 630; college of arts and sciences, 1898; law, 175; medicine, 263; architecture, 182; engineering, 1068; veterinary medicine, 107; agriculture, 604; home economics, 451. Of these students 1271 were women. For the 1927 summer session the registration was 2053. The faculty, composed of 1148 members, had 273 professors, 207 assistant professors, 12 lecturers, 416 instructors and 240 assistants. The productive funds of the institution on June 30, 1927, were \$20,715,668. The income applicable to current expenses of the fiscal year was \$7,083,778, including \$2,200,000 of State and \$300,000 of Federal appropriations. Gifts amounting to \$1,008,321 were received in the year 1926-27. The lands and buildings were valued at \$10,256,706 and the equipment at \$3,897,520. The library contained 780,000 volumes.

By agreement of the University and New York Hospital, the hospital and the Cornell Medical College were organically united as a single institution, to occupy jointly a new building to be erected at an estimated cost of \$11,000,000 between 68th and 70th Streets, overlooking the East River, New York City, their joint endowment to be augmented by a large appropriation of the General Education Board and by generous legacies provided by the will of Payne Whitney; Dr. G. Canby Robinson, of Vanderbilt University, was appointed director of the unified enterprise. The Charles Lathrop Pack Forestry Trust gave \$130,000 to endow a research professorship of forest soils; the heirs of Mathias H. Arnot of Elmira, N. Y., gave a forest tract of 1700 acres near the University for the use of the department of forestry. The George Fisher Baker non-resident lecturers in chemistry were Prof. A. V. Hill, of the University of London, and Prof. Paul Walden of the University of Rostock. The Messenger lecturer on the evolution of civilization was Prof. H. J. C. Grierson of the University of Edinburgh. Prof. J. L. Brierly of Oxford University lectured on international law on the Jacob H. Schiff Foundation. Appointments to the faculty included those of Allan Nevins of the New York *World* editorial staff, to be professor of American history, and G. W. Cunningham, of the University of Texas, to be professor of philosophy. F. B. Morrison, of the University of Wisconsin, succeeded R. W. Thatcher, director of the experiment stations, who resigned to become president of the Massachusetts Agricultural College. The faculty lost by death the following professors: Ernest Albee, philosophy; George P. Bristol, Greek, American; D. J. Crosby, agriculture; E. B.

Titchener, psychology; C. E. Nammack, W. G. Thompson, and R. G. Reese, medicine; W. R. Orndorff, chemistry, and L. A. Fuertes, lecturer in ornithology. President of the university, Livingston Farrand, LL.D.

COSTA RICA, kō'sta rēkă. A republic of Central America lying between Nicaragua and Panama, and bounded by the Caribbean Sea on the east and the Pacific Ocean on the west. Capital, San José.

AREA AND POPULATION. The area is estimated at 23,000 square miles. On May 11, 1927, for the first time in 35 years, a general population census was begun in Costa Rica, almost 800 persons being employed in the work. The last general population census made in 1892 showed the population of Costa Rica at that time to be 243,205. A preliminary report of the census published in the autumn stated the population to be 476,069, an increase of 232,864 or 95 per cent since 1892. At the same time an immigration project presented by Dr. J. S. Kammienny, delegate of the Polish Committee for the Promotion of Immigration, was under study by the Costa Rican government. The plan provided for the immigration of not less than 250 Polish-German families, totaling about 1080 individuals, to form a colony between the Zapote River (Liberia) and Culebra Bay, where they would engage in agricultural pursuits. Two Italian specialists were also in Costa Rica studying the possibility of establishing an agricultural colony of 100 Italians who are especially interested in coffee production and silk-worm culture.

In 1925 the movement of population was: Births, 19,960; deaths, 12,544; marriages, 3012. In the same year the immigrants numbered 5983 and the emigrants, 5318. The populations of the larger cities as estimated in 1924 were as follows: San José, 42,112 (with suburbs, 55,206); Alajuela, 13,737; Cartago, 19,376; Heredia, 13,842; Liberia, 2778; Limón, 11,989; and Puntarenas, 5867.

EDUCATION. Elementary education is free and compulsory, and the elementary schools are under local councils, but subventioned by the central government. The report of the Department of Public Education for the year 1925 gives the following school statistics: Number of schools in session during the year, 451; number of students enrolled, 38,822; average attendance, 33,249; total number of teachers employed, 1447—313 of whom were men and 1134 women. For secondary education there is a lyceum for boys and a college for girls. There are colleges at Cartago, Alajuela, and Heredia, together with professional schools of medicine, law, pharmacy, and dentistry.

PRODUCTION. Agriculture is the chief occupation, but there are large areas not yet cleared that contain valuable cabinet woods. Coffee and bananas are the chief agricultural products. According to the report of the Director-General of Statistics, a total of 273,520 bags of coffee, weighing 18,249,045 kilograms, was exported from Costa Rica in 1925-26. The value of the exports was 42,495,000 colones, of which 27,847,799 colones went to Great Britain. The next industry of importance is gold and silver mining, which is carried on on the Pacific slope. There are also deposits of manganese ore near the Pacific.

COMMERCE. The year 1926 was one of continued prosperity for Costa Rica. Her principal products

—coffee, bananas, and cacao—were exported in increasing quantities. Prices received by banana planters remained the same, but those received by the producers of the other two crops were better than those of 1925, that for coffee being the highest recorded. The foreign trade of the country in 1926 was: Exports, \$18,902,180; imports, \$13,825,977. This was the most favorable trade balance ever recorded by the country. According to statistics quoted by President Jimenez in his message to Congress on May 1, 1927, the total value of the foreign trade during 1926 was 131,152,627 colones, 75,848,719 colones representing exports and 55,303,908 colones imports. The chief articles exported were as follows:

Article	Value in colones
Coffee	42,495,977
Bananas	25,682,730
Cacao	8,297,423
Gold, silver, and minerals	2,082,034
Other articles	2,290,655
Total	75,848,719

FINANCE. The total receipts of the Costa Rican government during 1926 were announced to have been 27,417,349 colones, while the expenditures were 22,611,450 colones. The balance of 4,805,899 colones was used to reduce the national debt, to pay municipal debts to the amount of 1,000,000 colones, and to satisfy claims against the government. The budget for 1926 had estimated the receipts at 24,962,933 colones and the expenditures at 23,735,782 colones. On May 12, 1927, the emission of 8 per cent gold bonds to the amount of 10,000,000 colones was authorized by the government. This was the first of a series of bond issues covering a loan for public works as provided for in a decree of Dec. 24, 1926, the total of which is not to exceed 25,000,000 colones. Of the present loan, 2,000,000 colones are to be used for the construction and repair of roads in those provinces not now linked with the main highway system.

COMMUNICATIONS. In 1925 there entered the ports of the republic 671 ships of 1,199,385 tons, and cleared 671 ships of the same tonnage. The length of railway mileage is 413 miles, of which 81 miles are state owned. Indicative of the growing number of passengers and volume of freight being transported by the railways of Costa Rica each year are the following figures taken from the auditors' annual report of the Pacific Railway, one of the important roads in operation in that country:

Year	Receipts Colones	Expenditures Colones	Net receipts Colones
1923	1,808,244	1,701,404	106,840
1924	1,755,896	1,535,796	220,100
1925	2,132,877	1,715,108	417,268
1926	2,233,578	1,781,176	452,402

GOVERNMENT. The executive power is vested in a president who is elected for four years and who carries on his administration through six secretaries of state appointed by him and responsible to him; legislative power in a chamber of representatives called the Constitutional Congress with 43 deputies, elected for four years, one-half retiring every two years. President in 1927, Don Ricardo Jimenez, elected on

Dec. 7, 1923; assumed office May 8, 1924, for a period of four years.

COTTON. The cotton crop of the United States for 1927 was estimated by the Crop Reporting Board of the U. S. Department of Agriculture on December 8, 1927, at 12,789,000 bales of 500 lbs. gross weight. This was 5,188,000 bales below the crop of 1926 and 732,000 bales below the 5-year average, 1922-1926. The area planted to cotton was reported on July 1 as 42,112,000 acres, a 15 per cent reduction from the previous year. There was abandoned before harvest 4.6 per cent of the area planted. The estimated yield of lint cotton per acre for 1927 was 152.3 lbs. as compared with 182.6 lbs. in 1926 and 155.8 lbs. for the 5-year period, 1922-1926. There had been ginned to Dec. 13, 1927, according to the Bureau of the Census, 12,071,799 running bales. The total crop would depend upon the effect of various climatic and other factors on the portion still to be harvested.

The world's cotton crop for 1927 was believed to be less than that of 1926. The total area devoted to the crop was reported at 65,180,000 acres, exclusive of China, as compared with 73,680,000 acres in 1926. The International Institute of Agriculture reported on Dec. 13, 1927, that the cotton production of both Egypt and India would be considerably below normal. The crop of Egypt was estimated at 1,251,900 bales, a reduction of 16 per cent. Only a portion of India was reported upon. The crop of the Punjab was estimated at 524,700 bales and of the Madras Presidency at 282,340, both below the average of the last five years.

The world's production of cotton, exclusive of linters, in 1926 was about 28,000,000 bales. The principal producing countries and their crops were: United States, 17,977,000 bales; India, 4,973,000; Egypt, 1,600,000; Russia, 850,000; China, 1,667,000; Brazil, 600,000; Peru, 200,000; Mexico, 396,000; and the British Empire, exclusive of India, 312,000 bales.

The accompanying table shows, by States, the cotton crop of the United States for 1926, as reported by the Bureau of the Census, the estimated crop for 1927, and the amount ginned to Dec. 13, 1927.

States	Crop 1926	Estimated crop 1927	Reported ginned December 13, 1927
	500-lb. bales	500-lb. bales	Running bales
United States	17,910,258	12,789,000	12,071,799
Alabama	1,497,197	1,200,000	1,163,272
Arizona	122,770	93,000	67,262
Arkansas	1,545,659	980,000	890,063
California	180,955	94,000	68,085
Florida	81,952	17,000	17,174
Georgia	1,498,061	1,100,000	1,095,279
Louisiana	828,020	545,000	534,915
Mississippi	1,888,952	1,340,000	1,811,980
Missouri	218,152	104,000	85,716
New Mexico	70,866	70,000	60,286
North Carolina	1,204,496	857,000	824,448
Oklahoma	1,759,895	990,000	918,496
South Carolina	297,181	735,000	717,092
Tennessee	450,520	845,000	818,984
Texas	5,609,801	4,280,000	3,972,584
Virginia	50,545	32,000	26,548
All others	15,876	7,000	4,609

The table includes 487,401 round bales, which are counted as half bales, and 17,660 bales of American grown Egyptian cotton. The crop of Lower California, which is marketed quite

largely through California, is estimated at 50,000 bales, but this sum is not included in the figures for California or the totals for the United States.

In addition to the lint production during the year ended July 31, 1927, there were crushed by oil mills in the United States 6,301,911 tons of seed. Among the products produced from the seed were 1,037,084 bales of linters, 1,852,408 tons of hulls, 2,838,104 tons of cake and meal, and 1,886,836,168 lbs. of oil, besides other products.

Exports of cotton and linters for the year ended July 31, 1927, amounted to 11,183,938 bales, and the consumption by domestic mills during the same period was 7,202,734 bales. The principal exports were, to the United Kingdom, 2,573,658 bales; France, 1,023,977; Germany, 2,883,301; Japan, 1,615,755; and Italy, 782,083 bales. During the 12 months importations of 400,993 bales were reported, of which 321,767 were from Egypt; 93,272 from Mexico; 20,877 from Peru; 33,466 from China; and 18,892 from India. Of the amount used by American mills the greatest quantity was consumed by mills in the cotton growing states, 5,194,160 bales as contrasted with 2,008,564 bales in the New England and other States.

The cotton situation in the United States during the year was remarkable in a number of respects. Following the low prices of 1926 concerted efforts were made to secure a reduction in the area to be planted in the spring of 1927. There was quite a general response to this appeal which, combined with boll weevil and other insect damage, unfavorable weather in important areas, and the Mississippi Valley flood, resulted in a reduction of nearly one-third in the final crop. However, based on prices of Dec. 19, 1927, the farm value of lint and seed was \$1,462,571,000, which exceeded the value of the 1926 crop by more than \$330,000,000.

There continued to be quite an extension of the cotton-growing industry in western Texas and Oklahoma, and methods have been adopted that may seriously affect cotton production in some of the older portions of the Cotton Belt. Virgin land, large fields, and the extensive use of machinery, combined with freedom from boll weevil, have greatly reduced the costs of producing the crop. By the newer methods one man can plant and care for 75 to 150 acres of cotton as compared with 10 to 20 acres in the older regions. Snapping the bolls and "sledding" have greatly reduced the cost of harvesting the crop. The use of sleds, or strippers, by which the bolls are stripped from the plant, and improved ginning methods make it possible for one man to harvest as much cotton in a day as would be hand-picked by eight or 10 men. While the machinery used in this method of harvesting is somewhat crude its further development cannot fail to have an important part in the further development of cotton growing in the United States.

A conference was held in Washington, D. C., on Mar. 14, 1927, for the purpose of approving copies of the universal standards of grade and color for American cotton for the use of the U. S. Department of Agriculture and European exchanges during the two-year period beginning Aug. 1, 1927. Official staple standards were adopted for the United States, but they were

not accepted abroad. These standards are the required basis for transactions in American cotton sold in interstate and foreign commerce on standard description. Eight standard grades for cotton linters were established on Aug. 1, 1926, by the Department of Agriculture, and the Interstate Cotton Seed Crushers' Association adopted trading rules based upon the use of these standards.

Attention continued to be given to various biological factors concerned in cotton production in the United States. The cotton root rot was becoming of increasing importance in the southwestern part of the country, and Congress provided a fund for its investigation. The agricultural experiment station of Texas also undertook an extensive study of this disease and means for its control. The boll weevil, after a period of partial subsidence that led many cotton growers to relax in their efforts for control, appeared after hibernation in greater numbers than in any year since 1923, and conditions for the multiplication of the weevils were favorable throughout much of the area. The cotton flea hopper, that made its appearance in destructive numbers in 1926, continued to be a problem in many localities. Fairly good control has been secured in some instances by dusting the cotton plants with sulphur on bright, hot days. The pink bollworm has apparently become a fixture in the Rio Grande Valley in New Mexico and adjacent Texas, and it was found during the year in southwestern New Mexico and southeastern Arizona. Several formerly infested regions in Texas and Louisiana are no longer regarded as sources of danger, no infestation having been found in these regions since 1921. The definite discovery that the *Thurberia* boll weevil in Arizona would attack cotton led to considerable activity for its control through quarantine regulations that included compressing the cotton and heating the seed. Court injunctions in November, 1926, interfered with the activities for control in one locality, but regulations of Texas and California prevented the movement of the cotton out of Arizona. Every effort was being made to prevent the spread of this insect to new areas, as with its capacity to withstand heat it was considered a menace to regions that are not now subject to the common boll weevil by reason of their high temperatures and arid conditions. COWDRAY, WILLIAM DICKINSON PEARSON, FIRST VISCOUNT. British capitalist and developer of oil fields, died at Dunecht House, Aberdeenshire, Scotland, May 1. He was born at Shelly Woodhouse, Yorkshire, July 15, 1856, and was educated privately at Harrogate. After a short apprenticeship in the firm of S. Pearson & Company, public utility contractors, founded by his grandfather in 1876, he became a partner

and devoted himself to new enterprises in Spain and the United States. In 1889 he went to Mexico, where the firm began a series of important projects having to do with drainage, railways, electric lines, harbors and water works. In this connection Pearson was able to acquire many thousands of acres of rich oil lands, which he proceeded to develop. While so engaged he was in a struggle with American oil interests led by the Standard Oil Company. He was the first to fill oil tankers at sea through pipes. After the War he relinquished his controlling interest in the Mexican oil fields to the Royal Dutch-Shell group. He received a baronetcy in 1894 in recognition of the opening of the Blackwall tunnel under the Thames, which his firm had built. They also were contractors for the extension of Dover harbor and built numerous docks and other harbor works at London, Southampton, Hull and Malta. In the United States the firm of S. Pearson & Company constructed the tunnels under the East River for the Pennsylvania Railroad Company, and in Egypt they built the great dam across the Blue Nile above Khartum. Pearson was active in politics from 1895, when he was elected to represent Colchester in Parliament as a Liberal, having previously failed of election for that constituency in 1892. In 1910, when he retired from the House of Commons, he was created a baron, taking the title of Lord Cowdray of Midhurst, and in January, 1917, he was created a viscount, in recognition of his supervision of the Gretna Green munition factory, a colossal undertaking. During the War he also built the tank assembly factory at Chateauroux. In 1917 he succeeded Lord Sydenham as chairman of the air board, and was successful in harmoniously coordinating the air forces and increasing the supply of aircraft. When he relinquished the work in November, 1918, after the armistice, there had been a threefold increase in the effective air forces of the British army. Viscount Cowdray was a generous giver to various public objects, including the University College, London, and the League of Nations' Union to which in 1921 he gave £50,000.

COWS. See DAIRYING. For Feeding of Cows, see FOOD AND NUTRITION.

COXE, WILLIAM GRISCOM. American marine engineer and shipbuilder, died at Bellevue, Del., July 4. He was born at Reading, Pa., Feb. 25, 1869, and after graduating from the Royal Technical College in Berlin served an apprenticeship as marine engineer with J. & W. Thompson Company of Clyde Bank, Scotland. He was also with the North German Lloyd repair plant at Bremerhaven, and from 1898 to 1904 he was with the William Cramp & Sons Shipbuilding Company of Philadelphia as foreign representative and assistant general superintendent. Leaving the Cramps, he became head of the Harlan & Hollingsworth Corporation, Wilmington, Del., then general manager of the Pusey & Jones plants at Wilmington and at Gloucester, N. J. He was also consulting engineer of the Chester and Bristol plants of the Merchants' Shipbuilding Company and district manager of the United States Emergency Fleet in the Delaware River. From 1917 to 1920 Mr. Coxe was president of the Atlantic Coast Shipbuilding Association and of the Reading Paper Mills Company. During the Spanish-American War he served in the United States navy as a lieutenant, senior grade. He was a member of many engineering and marine

societies, and had important financial and commercial relations.

CRAIK, SIR HENRY. British educationist and author, died in London, England, March 17. He was born in Glasgow, Scotland, Oct. 18, 1846, and was educated at the High School of that city and at Glasgow University and Balliol College, Oxford, where he took honors in classics and history. He became examiner in the educational department in 1870, and senior examiner in 1878. From 1885 to 1904 he was secretary of the Scotch Educational Department, Whitehall. He was principal of Queen's College, Harley Street, 1911-14. He was honored with a C.B. in 1887 and was created K.C.B. in 1897. In 1926 he was created a baronet, having previously been made privy councillor in 1918. He had the degrees of M.A. from Oxford and LL.D. from Glasgow and St. Andrews Universities. He was a member of Parliament as a Conservative from Glasgow and Aberdeen Universities after 1906, and one of the members for the Scottish universities after the redistribution in 1918. In addition to his official duties he wrote extensively and edited for Macmillan & Company, Ltd., five volumes of *English Prose Selections* (1892-96), and a series in which his own *The State and Education* (1883) appeared. Most characteristic of his work was *A Century of Scottish History* (1901) which treated mainly of the time from the rebellion of 1745 to the disruption of 1843. He also wrote: *Life of Swift* (1882); *Selections from Swift* (1893); *Impressions of India* (1908); and *Life of Edward, First Earl of Clarendon* (1911).

CRANE, ROBERT NEWTON. American lawyer in London, died in London, May 6. He was born in Long Branch, N. J., Apr. 1, 1848, and was graduated from Wesleyan University, from which he received the degree of A.M. in 1870. With Richard Watson Gilder he founded the Newark, N. J., *Morning Register* in 1869, and in 1873 he became editor of the *St. Louis Globe-Democrat*. In 1874 he was appointed United States consul at Manchester, England, and served until 1880, when he was admitted to the Missouri bar. In 1881 he was admitted to the bar of the United States Supreme Court. He was chancellor of the diocese of Missouri in 1882, and, going to London, was called to the bar as a barrister of the Middle Temple in 1894, and in 1921 was made King's Counsel, being the first American to enjoy that honor. He represented the United States government on the South African Deportation Claim Commission in 1901, and the Samoan Arbitration Award, 1903-04. He was United States Government Dispatch Agent from 1904. In 1919 he was made a bencher of the Middle Temple. Wesleyan University conferred on him the degree of Doctor of Civil Law in 1921. He was a member of the executive committee of the Society of Comparative Legislation in 1908, and chairman of the London branch of the American Navy League. He was also active in the American Society in London and had an extensive private practice. He enjoyed high honors in British Freemasonry.

CRANE, THOMAS FREDERICK. American educator, died at Deland, Fla., December 9. He was born at New York, July 12, 1844, and was educated at Princeton, graduating in 1864 and receiving his A.M. in 1867. He received the Ph.D. degree in 1883, and that of Litt.D. in 1903. Dr. Crane was associated with Cornell University,

Ithaca, N. Y., from the time when it opened its doors in 1868 until his retirement from active classroom work in 1909, and was the last surviving member of the original faculty. He was at various times professor of the modern languages, professor of Spanish and Italian, professor of the Romance languages, dean of the faculty, and acting president of the university. He was held in the highest esteem by successive generations of students, who called him, affectionately, "Tee Fee," and conferred on him the title of "The Grand Old Man of Cornell." College songs were written concerning him, and are still chanted affectionately by Cornell alumni. Professor Crane was author or editor of the following: *Italian Popular Tales; The Exemplar, or Illustrative Stories from the Sermons of Jacques de Vitry; Tableaux de la Révolution Française; Le Romantisme Français; La Société Française au Dix-Septième Siècle; Chansons Populaires de France; Boileau's Les Héros de Roman; Rotrou's Saint Genest and Venceslas; Pez's Italian Social Customs of the Sixteenth Century; Pez's Liber de Miraculis Mariae; also works on folk lore and Romance literature.*

CRAPSEY, THE REV. ALGERNON SIDNEY. American author, lecturer and former Protestant Episcopal clergyman, died at Rochester, N. Y., December 31. He was born at Fairmount, Ohio, June 28, 1847, and received a grammar school education; he studied later at St. Stephen's College and the General Theological Seminary, New York. He served for a time in the Union Army in the Civil War. After graduating from the seminary in 1872, in 1873 he entered the priesthood, and in 1874 he became an assistant at Trinity Church, New York City. This position he resigned to become rector of St. Andrew's Church, Rochester, N. Y., and he remained in charge of the latter church for more than twenty-five years. He received the degree of S.T.D. from Hobart College in 1900. In 1904 and 1905 Dr. Crapsey preached a series of sermons in which he denied the doctrines of the virgin birth of Christ and the resurrection and ascension of the literally physical body of Christ, although previously he had avowed his belief in the spiritual verity of the resurrection. The expression of these heterodox views brought about his condemnation by an ecclesiastical court of his diocese, and he was deposed from the ministry of the Protestant Episcopal Church, on Dec. 4, 1906. The trial and condemnation of Dr. Crapsey excited much interest and discussion. The later years of Dr. Crapsey's life were given over largely to writing and to The Brotherhood, an order which he founded in Rochester, N. Y. He lectured also, and was parole officer of New York State in 1914. In an autobiography published in 1924 he called himself "the last of the heretics," but there have been other condemnations for alleged heresy in other churches since his trial, notably that of Bishop William Montgomery Brown in 1925. Dr. Crapsey wrote the following: *The Five Sorrowful Mysteries* (1883); *The Five Joyful Mysteries* (1885); *A Voice in the Wilderness* (1897); *The Disunion of Christendom* (1900); *Sarah Thorne* (1900); *The Greater Love* (1901); *Religion and Politics* (1905); *The Rebirth of Religion* (1907); *The Rise of the Working Class* (1914); *The Ways of the Gods* (1920); *The Last of the Heretics* (1924).

CREAM. See DAREYING.

CREED, WIGGINTON ELLIS. American manager of public utilities, died at San Francisco, Cal., August 6. He was born at Fresno, Cal., Feb. 8, 1877. He graduated from the University of California in 1898, having specialized in the study of law. He was admitted to the bar in California and started practice in San Francisco in 1902, becoming a member of the firm of Titus, Wright & Creed. During his law practice he studied public utility administration and banking, and attracted the attention of many important industrialists on the Pacific coast. In 1915 he was selected to adjust the affairs of the People's Water Company, in Oakland, and as a result he became the president of the East Bay Water Company, which was incorporated to supply the district. In July, 1920, he became president of the Pacific Gas & Electric Company. The efficiency of the company became known throughout the entire field of public utilities. In addition to his services to this company, he was president of several other large industrial corporations. He was active in many important movements, especially in the development of water power on the slopes of the Sierra Nevada. He was interested in charitable institutions, and served for eight years as trustee of the California Institution for Deaf and Blind. He served as president of the University of California Alumni, and in that capacity sat on the board of regents of the University of California. In 1921 he was honored with the appointment of Weinstock lecturer at the University of California. Mr. Creed was also a trustee of Mills College.

CRETE. An island in the Mediterranean Sea, ceded to Greece after Aug. 10, 1913. Area, 3327 square miles; population at the census of 1920, 110,746. Capital, Canea, with a population of 37,425, in 1920. See *ARCHAEOLOGY*.

CRICKET. There were no international cricket matches of importance contested in 1927 and for the second year in succession the Halifax Cup series between the United States and Canada was omitted. A negro team from Bermuda visited New York City during the year, winning six games, losing one and drawing two. The annual match between Oxford and Cambridge was won by the latter and Lancashire captured the English county championship. The Brooklyn Cricket Club for the second successive year won the Metropolitan District League title and the same club carried off the honors in the New York and New Jersey Cricket Association competition. R. A. Wilson and P. B. Green of the Brooklyn Club were the leading batsman and bowler, respectively.

CRIME. To a very important extent, progress was made in this field by the clarification of certain fundamental issues. Experts agreed that while the terms crime and criminals were being bandied about, very little was actually known. There were no crime statistics; there was no classification of crime to permit of the comparison of statistics; there was no knowing whether crime was on the increase or no. At least, there was one thing vitally necessary: the classification and collection of criminal statistics comparable to the present status of vital statistics. The National Crime Commission, in making public this elementary fact, had cleared the air appreciably. Space must be given to the concise summary presented by Prof. Raymond Moley, an outstanding authority, at the Washington conference of the National Crime Commission (of the United States) spoken of below:

ference of the National Crime Commission (of the United States) spoken of below:

We want to know more than we now know concerning the number of crimes that are reported to public authorities in this country. That is the measure of crime. We want to know what happens to those who are arrested. We want to know what happens to these cases that are thus initiated. We want to know how many drop out in preliminary hearings. We want to know how many drop out in the next stage. Then after we know these few simple facts, we want to cross-reference them and correlate them in order to determine, so far as possible, what degree of efficiency our agencies for the prosecution of criminals are attaining. We want to know more about our prisoners. We want to know more about the operation of parole. We want to know more about the operation of probation. We can not just thoughtlessly discredit these new agencies for correction. We must know more about what they have done.

Some of the discussions during the year were outstanding contributions to the subject. Mention needs be given to the series of articles published in the December *Current History* in which Prof. H. E. Barnes and Dr. George W. Kirchwey wrote illuminatingly. The former, arguing that no statistics could be adduced to indicate crime waves, pointed to some interesting changes in the status of crime. Criminals were younger. They no longer roved in gangs. Our police systems, linked to politics as they are, are inadequate. Our system of criminal jurisprudence is based on the theory of punishment rather than that of treatment. Our system of juries is absurd. The writer suggests a series of reforms which he is quick to admit it would not be easy to have adopted. Professor Barnes argues for: Removing the police from politics and making them more intelligent. The substitution for the jury system of paid experts to "pass on the guilt and innocence of the criminal and the nature of his treatment. (See below Governor Smith's suggestion on this point). The elimination of the modern prison which breeds criminals and the emphasis on preventive work like sterilization and habit clinics, as well as the wider extension of probation and the medical and psychiatric treatment of the habitual criminals in institutions designed for their care. The author, in attacking the theory of the Baumes laws, says positively: "The one great lesson of criminological history is that severity of punishment is not an adequate deterrent."

Dr. Kirchwey, welcoming the abatement of the "crime wave" hysteria, appealed to cooler counsels in the consideration of the causes of crime. He believed that savage punishment for crime was a mistaken emphasis; that greater good could come from "a study of the individual and social factors which have cooperated in producing the criminal mind." He refused to take seriously the efforts of the Baumes laws to speed up procedural law and judicial administration. These are, after all, unimportant. With courts and police in politics much is lacking. Said he: "It is written in letters of blood in the history of the race that savage punishments in the long run defeat their own ends. We may safely leave the Baumes laws and their like to the verdict of history."

What had been reached, it appeared, was a breathing spell. Authorities were refusing to believe that a crime wave existed; they refused to give sanction to the cry for stern modes of punishment. They were insisting that the emphasis is misplaced; crime reflects a social condition and an individual attitude. We must first

study the social background, and then the proper treatment of the criminal before we may speak with assurance.

NATIONAL CONFERENCE ON REDUCTION OF CRIME. The National Crime Commission, as its most important activity of the year, was responsible for the calling of this conference in Washington, in November. Some three hundred delegates, under the chairmanship of F. Trubee Davison, assembled. There was commendation for the New York Baumes laws by Mr. Davison who declared that it was the chief aim of the Commission "to stimulate the formation of suitable agencies throughout the United States whose task it should be not only to study the crime situation from a local standpoint, but to recommend and urge to proper authorities immediate measures of practical relief." Charles H. Tuttle U. S. District Attorney for the Southern District of New York, in pointing out the evils of the "fence" system, declared that the entire crime bill of the country amounted to ten billions of dollars annually. It was his belief that the Federal authorities had ample powers to cope with the "fence." On the first day, other speakers made mention of the need for crime statistics, the strengthening of the police power, the elimination of antiquated statutes, and the assistance from private individuals in an organized vigilante system.

Chief Justice Taft held the floor at the second day's session. His approach took little heed of newer theories in criminology. Justice Taft spoke favorably of the arousal of public opinion throughout the country, the creation of State commissions, and the theories underlying the work of the Baumes commission. The purpose of punishment is its deterrent effect, and he warned against over-sentimentalizing the criminal. The Chief Justice called for the strengthening of the police, prompter indictments, and the investing of judges with greater powers "to guide the trial and to help the jury in understanding the evidence and in reaching its conclusion upon the evidence." He objected particularly to jurors being given free rein, and to the types of jurymen being chosen. He said: "There will have to be a further examination of the methods by which jurors are selected. The method of selection ought not to be such that counsel for the defendants, by the exclusion of worthy citizens from the panel, may select jurors of weak intelligence, of little experience and subject to emotions easily aroused."

Other speakers reverted to a favorite theme at these discussions: The necessity for the establishment of a national clearing house for criminal statistics.

The conference, too, preoccupied itself with the medical-psychiatric aspects of crime. The Massachusetts so-called Briggs law was explained by its author. The law calls for the sitting of a board of psychiatrists for the purpose of examining individuals indicted for capital offenses or of second offenders, in felonies. The psychiatrists act as friends of the court, and thus eliminate the warring alienists who have so often confused important issues. This method of handling criminals was further stressed by Dr. F. E. Williams of the National Committee for Mental Hygiene. He said:

There is no more difficult question to solve than the mental status, mental mechanism or capabilities of a prisoner, and the bearing these may or may not

have upon his conduct and the possibility of his rehabilitation. All the resources of modern psychiatry and psychology are necessary and these should be available to the court through the possibility of the appointment of psychiatrists from a qualified list, who shall be given opportunity for thorough psychiatric examination, with obligatory written reports and a remuneration from public funds. The process is not primarily in the interest of the prisoner, but in the interest of the social group, there being but one end in view—the protection of the group from any further attacks by the prisoner.

NEW YORK STATE. Mention has been made in the YEAR BOOK (1926) of the work of the Baumes Commission. Subcommissions continued to sit and a variety of useful activities has been performed particularly along preventive lines. The subcommission on penal institutions submitted its report in December. It called for the construction of new prison shops and the rehabilitation of old ones, the completion of Sing Sing Prison, and the development of a varied class of industry to keep prisoners occupied. Of the 6000 prisoners in State institutions it appeared that 3000 had little or no work to do, that the prisons were not functioning adequately in the reclaiming of offenders, and that adequate investigations were not being made of the prisoners prior to confinement. Said the report on this phase:

Often convicted ones go to States' prison when reformatory methods or mental and physical treatment would better serve the State, society, and the delinquent. There is much guessing by police, prosecutors and judges as to the proper treatment of convicted persons. Facts—social, medical, mental—are essential to proper disposal and treatment of every person convicted of crime. Adequate social histories are essential both for classification and treatment of prisoners and to also indicate points of attack in preventing crime.

The subcommission made another important recommendation for the abolition of county jails, except for the briefest terms of confinement. In their places it would put district penitentiaries and State industrial farms, the latter to be equipped for vocational training. The sub-commission on police delivered an informal report in December, paying particular attention to the status of private detectives. It indicated it would recommend better education and higher standards for these, the supervision to be placed in the hands of the State Board of Regents.

Another important development in this field was the address of Governor Smith before the Baumes Commission, on December 6. The Governor declared he favored radical changes in the sentencing of felons and in the system of parole and probation. With regard to the former the Governor advocated the removal of the power of sentence from judges and the placing of it in a board "the members of which would be the highest salaried men in the State's employ." The board would have power to determine whether a convicted felon should go to an insane asylum or to prison, the amount of punishment, and the extent of parole granted. Said the Governor: "The power of the judge to sentence to death has done more than anything else to prevent convictions for murder in the first degree. The jury in felony cases ought to determine only the guilt or innocence of the person on trial. If the accused is adjudged guilty, he should be turned over to the State for disposition to be determined by a special board."

Governor Smith also advocated a new kind of board of parole made up of the State commissioners of correction, the warden of the prison

where the prisoner was confined, and a third member to devote all his time to the work. At present the members of the board receive very little compensation, with the result that the warden is largely responsible for its functioning. The Governor also would like to see probation placed under the judiciary.

STATISTICS. Students of this subject continued indebted to Dr. Frederick L. Hoffman for the compilation of the only trustworthy statistics at present being made. Mention has already been given in these columns to the general lack of reliable crime statistics and how those being presented are open to all varieties of interpretation. Dr. Hoffman, in presenting his murder death rates for 1926, finds a decline from 1925 of 11 per 100,000 to 9.9 for the 28 cities in which uniform statistics have been kept. New York City's murder death rate dropped from 6.4 to 5.7 in 1926, Chicago's from 18.8 to 16.7 while Jacksonville, Florida, had a rate of 75.9 in 1926 and Birmingham, Alabama, had a rate of 58.8 (54.5 in 1925). Other murder rates were: Boston, 3.9; Cleveland, 12.5; Dallas, 32; Detroit, 25.3; Houston, Texas, 25.8; Kansas City, Mo., 18.8; Minneapolis, 2.1; Nashville, 29.2; Philadelphia, 8.6; Pittsburgh, 10.4; Richmond, 10.1; St. Louis, 18.6; San Francisco, 8.6; Tampa, Florida, 6.7; Washington, D. C., 10.0. There were no homicides reported from Gloucester, Haverhill, Malden, Newton and Salem, all in Massachusetts, and from New Britain, Conn. Dr. Hoffman believed that the year 1926 marked the crest of murder deaths and that crime commissions were helping considerably. Yet in 1926, 12,000 murders had taken place. This authority further declared that the New York Baumes laws would have "a profound effect in checking the increase of serious crimes."

The New York Police Department, too, issued some significant criminal figures. In discussing the large decrease in violent crimes in New York City for the months of April, May and June of the year, the police commissioner was of the opinion that the Baumes laws had acted as marked deterrents. Other important factors were the greater vigilance of the police and the district attorney and the severe sentences being imposed by the courts. The police commissioner, in comparing the second quarter of 1927 with those of 1926 and 1925, gave the following figures to show the drop that had taken place:

	1927	1926	1925
Murder or manslaughter	67	72	81
Felonious assault	511	555	576
Assault and robbery	207	284	328
Burglary	826	854	1,004
Total	1,611	1,765	1,989

Hold-ups (assault and robbery in above) greatly fell off, notably in jewelry shop cases (100 per cent), in messenger cases (92 per cent), in office hold-ups (89 per cent), in garage hold-ups (85 per cent), in payroll hold-ups (67 per cent), in truck robberies (67 per cent), in taxi hold-ups (47 per cent). There were no hold-ups involving more than \$10,000 and only 13 involving more than \$1000 (as compared with 45 in 1926). In these two groups the hold-ups showed a total loss of \$25,458 as compared with \$553,064 in 1926. The commissioner also showed a decrease of 10 per cent in grand larceny

cases. Comparing the second quarter of 1927 with that of 1926 the commissioner said: "In this connection it may be well to point out that it is in the matter of curtailing automobile thieves and pickpockets that the police have a real opportunity to exercise methods of crime prevention. The second quarter of 1927 shows a decrease in automobile thefts of 10 per cent; in pickpocket cases, a decrease of 75 per cent."

Arrests for all cases during the second quarter of 1927, compared with 1926, showed a large increase, as follows:

	1927	1926
Felonies	4,467	5,575
Misdemeanors	34,930	33,911
Juvenile delinquencies	1,480	1,702
Summonses	69,122	57,821
Witnesses	19	34
Total	110,018	98,543

The great necessity for the tabulation and standardization of crime statistics was urged by the National Crime Commission, in a special report. The commission's report called for the establishment, by each State, of a bureau of criminal statistics and a bureau of criminal identification, with the Bureau of the Census and the Bureau of Identification of the Department of Justice acting as the federal clearing houses. In commenting on the present hopeless disorganization, the report said: "For example, New York State has been trying for 98 years to compile statistics of convictions in courts of record and has not yet succeeded in developing them to the point where they are worth anything. No other State can quite match this long record of wasted effort, although some of them come very close to it."

FIREARMS. One of the important activities of the National Crime Commission has been the agitation toward the restriction of the sale of firearms. In the legislatures of 24 States this year bills were introduced to this effect. Michigan's, New Jersey's, and Rhode Island's laws were rigorous. Penalties against the use of pistols were placed in the laws passed by Vermont, Minnesota, Missouri, Massachusetts and Iowa. Minnesota strengthened its pistol law, but refused to license machine guns. On the other hand, legislatures in the following States refused to act: Montana, Tennessee, Washington, West Virginia, Texas, Pennsylvania, Oklahoma, Idaho, New Mexico, Nebraska, Maine, Indiana, Illinois, Georgia, Arizona, and New York. Illinois refused to restrict the use of both pistols and machine guns.

OTHER DEVELOPMENTS. The example of New York State, in placing increasingly heavy penalties on habitual offenders, was followed by North Dakota, Kansas, Oregon, California, New Jersey, Vermont and South Dakota. In Iowa and Illinois the authorities countenanced the organization of vigilante campaigns with the result that there was a reported drop in bank robberies in rural districts. Other groups of business men began to consider the idea seriously.

CRITICISM. See LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE; ETC.

CROATIA, KRAVASHA, AND SLAVONIA. Since 1918 a province of the new state of Yugoslavia (Yug.); formerly a crownland of the

Austro-Hungarian Empire, extending from the Adriatic Sea to the Danube River. Area, Jan. 31, 1921, 16,920 square miles; population at the same date, 2,739,593. Capital, Zagreb or Agram, with a population in 1921 of 108,338 (estimated in 1925, 130,000).

CROPS. See AGRICULTURE and articles on various crops such as CORN, OATS, TOBACCO, WHEAT, ETC.

CROSS-COUNTRY RUNNING. Willie Ritola of the Finnish-American Athletic Club, New York City, for the fifth time and for the third year in succession won the national senior cross-country running championship in 1927. Ritola captured the title by covering the six-mile course in Van Cortlandt Park, New York City, in 29 minutes, 27½ seconds, or one-fifth of a second slower than the record. Both the Finnish-American Athletic Club and the Millrose Athletic Association claimed the team honors in this event and the question was referred to the Amateur Athletic Union which failed to reach a decision during 1927. Ritola also captured the Metropolitan senior title for the sixth successive year. The team championship here was awarded to the Millrose Athletic Association.

The intercollegiate cross-country championship was won by Penn State College for the second year in succession, W. J. Cox of Penn State being the individual victor for the second year in a row. His time for the six miles was 30 minutes, 36½ seconds. The team scores of the first five colleges entered were: Penn State, 50; Harvard, 60; Maine, 60; Union, 92; Massachusetts Institute of Technology, 150.

The national Amateur Athletic Union Marathon championship was won for the fourth time by Clarence H. De Mar, whose time for the 26 miles, 385 yards, was 2 hours, 40 minutes, 22½ seconds. De Mar also won the Baltimore Marathon.

CROSSLEY, ARTHUR WILLIAM. British chemist, died at Alderley Edge, England, March 6. He was born Feb. 25, 1869, and was educated at the Mill Hill School and at Victoria University, Manchester, later studying at the Universities of Würzburg and Berlin, receiving the degree of Ph.D. from the former. In 1904 he was appointed professor of chemistry and director of the research laboratory of the Pharmaceutical Society of Great Britain, and later was Daniell professor of chemistry in King's College, University of London. In 1907 he was elected a Fellow of the Royal Society. During the World War he was secretary to the chemical warfare committee of the Ministry of Munitions. From 1916 he served as commandant and superintendent of the experimental station of the Royal Engineers at Porton, with the rank of lieutenant-colonel, and in recognition of his services received the honors of C.M.G. in 1917 and C.B.E. in 1919. He was an honorary LL.D. of St. Andrews University, and at one time president of the Chemical Society. In 1919 he was made director of the British Cotton Industry Research Association, and organized the Shirley Institute at Didsbury, which was formally opened in 1922. He contributed extensively to various chemical journals.

CROTHERS, SAMUEL MCHORD. American clergyman and essayist, died at Cambridge, Mass., November 9. He was born at Oswego, Ill., June 7, 1857, and after graduating from

Wittenberg College in 1873 studied at Princeton, from which he received the degree of A.B. in 1874, and at Union Theological Seminary and the Harvard Divinity School. He was ordained to the Presbyterian ministry in 1877, becoming pastor at Eureka, Nev., in the same year, and at Gold Hill, Nev., in 1878. From 1879 to 1881 he had a charge at Santa Barbara, Cal., and in 1882 he entered the Unitarian ministry. He was pastor at Brattleboro, Vt., until 1886, and at St. Paul, Minn., from 1886 to 1894, when he went to Cambridge, Mass. to be pastor of the First Church, a position he held at the time of his death. He was a preacher for Harvard University, and was widely known for his contributions to magazines and his essays. These were not only humorous and shrewd, but exhibited a ripe and cultured mind well stored with literary lore. With a pleasing irony he often discussed modern conditions in social life and literature, and his work had a broad appeal. The more important of his writings, including his children's stories, are: *Members of One Body* (1894); *Miss Muffet's Christmas Party* (1901); *The Gentle Reader* (1903); *The Understanding Heart* (1903); *The Pardoner's Wallet* (1903); *The Endless Life* (1905); *By the Christmas Fire* (1908); *Oliver Wendell Holmes and His Fellow Boarders* (1909); *Among Friends* (1910); *Humanly Speaking* (1912); *Three Lords of Destiny* (1913); *Meditations on Votes for Women* (1914); *Pleasures of an Absentee Landlord* (1916); *The Dame School of Experience* (1919); *How to Know Emerson* (1920); and *The Cheerful Giver* (1923).

CRUISERS. See NAVAL PROGRESS.

CSERNOCHE, chér-nûk, JOHANN, CARDINAL. Archbishop of Graz and primate of Hungary, died at Budapest, July 25. He was born at Kalocsa, June 1852, and was educated at Graz and the University of Vienna, being made priest at Vienna in November, 1874. After serving three years as chaplain, and a year as professor of theology at Graz, he was made secretary and chancellor of the Archbishopric of Graz. In 1888 he became prebendary and in 1893 canon of the cathedral, under Archbishop Simor. He was a church leader in Hungary, and was one of the founders of the Catholic Party by which he was elected to Parliament. Ill health prevented his acceptance of the bishopric of Szatmar, but in 1908 he was appointed bishop of Temesvar, from which he was transferred to the see of Kalocsa in 1911, and in 1913 he became Archbishop of Graz and primate of Hungary. He was created a cardinal by Pope Benedict XV in 1914. Under the régime of Bela Kun he was threatened and expelled from his residence, but with the stabilization of conditions he returned to his see. In June, 1926, he visited the United States on the occasion of the Eucharistic Congress at Chicago, and was extensively honored by former Hungarians in America.

CUBA. a republic of the West Indies consisting of the large island of the same name, the Isle of Pines, and small adjacent islands. Capital, Havana.

AREA AND POPULATION. The area is 44,164 square miles of which 41,634 are for the island of Cuba, 1180 for the Isle of Pines, and 2350 for the other islands. According to figures furnished by the Director of the Census Bureau the population of Cuba on April 30, 1926, was 3,350,026 inhabitants, distributed as follows:

	<i>Inhabitants</i>
Pinar del Río	280,831
Habana	922,438
Matanzas	335,080
Santa Clara	719,263
Camagüey	245,042
Oriente	847,377

The City of Havana had 565,272 inhabitants, being the only city in the republic whose population was over 100,000. Other important cities are Cienfuegos, 72,919; Camagüey, 92,073; Manzanillo, 60,544; Santiago de Cuba, 73,800; Guantánamo, 52,598; Santa Clara, 69,200; and Sancti Spiritus, 86,418. There is a large transitory immigration yearly consisting largely of Spanish laborers who return to Spain after the harvest season. The number of immigrants in the year ending June 30, 1926, was 85,288, against 79,361 in the preceding year.

EDUCATION. Education is free and compulsory between the ages of six and 18. The public system was developed under American supervision after the passage of the Education Act of 1899. According to statistics compiled by the Division of Statistics, during 1925-26 there functioned 3664 school buildings, with 6973 classrooms in which were offered all branches of education. The enrollment in the public schools was 433,200 and the average daily attendance 237,684. The number of teachers in the day schools was 7205. Seventy-nine zones were served by 75 visiting teachers, who reached 157 school groups with an average daily attendance of 3644 pupils. The number of night schools which functioned was 79 with an enrollment of 6983 pupils and an average daily attendance of 2685. In the six primary schools held in penal institutions 1070 persons were enrolled, and an average daily attendance of 687 was reached. The number of teachers employed in the various classes for special instruction was 586. The Division of Statistics also received reports from 464 private schools comprising 1318 classrooms, 1532 teachers, and 29,600 pupils, with an average daily attendance of 25,388. There is a special institute for advanced instruction in each province, and annexed to each is a normal school for the training of teachers. University instruction is provided by the University of Havana which was founded in 1721.

PRODUCTION. Sugar and tobacco are the staple products, but cacao, cereals, coffee, potatoes, and fruits are also raised. Cuba is the largest producer of sugar (q.v.) in the world (between four and five million tons annually). The agricultural activities of the inhabitants are consequently largely concentrated on this crop; 80 per cent of the sugar crop is shipped to the United States. President Machado said in a statement made on June 17, regarding the sugar

industry, that the grinding of the crop for the season of 1926 and 1927, which was practically completed, showed a production of 4,500,000 tons, thus demonstrating in a conclusive manner that the measures adopted by the present government regarding this important industry have been faithfully carried out. (See preceding YEAR BOOK.) The next grinding season was not to commence until January, 1928, and the order prohibiting the clearing of ground for planting sugar cane was extended for another year, that is, until July, 1928.

COMMERCE. According to the statistical section of the Treasury Department, imports in 1926 amounted to 260,820,438 and exports to 301,708,731 pesos, leaving a favorable trade balance of 40,822,293 pesos. According to the U. S. Bureau of Foreign and Domestic Commerce, the foreign commerce of Cuba during the first half of 1927 amounted to \$318,749,603—an increase of \$29,320,538, or more than 10 per cent over the corresponding total for the first six months of 1926. After dropping steadily during 1925 and 1926, the trend was reversed so far in 1927, although the foreign trade was still at a very low level. The improvement was the result of enhanced sugar prices, which, while still low, were higher than in 1926. The increase of \$33,865,712 in exports was responsible for the greater returns, as imports declined. Exports to all countries other than France were greater in the first half of 1927 than in the same period of 1926, and the loss in the case of France was small. A feature of the trade was the increased sales to the United Kingdom, in which market Cuba suffered a considerable loss in 1926. Shipments to that country were \$20,092,825 for the half year, or only \$1,888,335 less than for the entire year 1926. Exports to the United States increased \$17,802,085, or by nearly 15 per cent.

Cuba's foreign purchases were further curtailed in the first half of 1927 and the imports recorded a loss of \$4,545,174. The scaling down of imports was in keeping with the prevailing unfavorable economic situation, as the improvement which occurred in the early part of the year was not sufficiently great to give sustained stimulus to purchases. The grinding of the 1927 sugar crop was carried out at high speed, so that with the reduced output the campaign practically ceased in the middle of May—earlier than in a normal season, despite the fact that the initiation of grinding was delayed until January. This served to hasten the period of widespread unemployment between crops, and tended to accentuate the consequent off-season dullness. Imports from the United States decreased by \$2,321,879, or a little more than 2½ per cent; France showed a gain of about 12 per cent and the only other gain was a slight one registered in the countries grouped under "All other."

IMPORTS INTO CUBA

<i>Country of origin</i>	<i>First half, 1926</i>	<i>First half, 1927</i>	<i>Increase or decrease</i>
United States	\$86,958,470	\$84,686,591	— \$2,321,879

The protracted labors of the Cuban Tariff Commission, which was organized by a law of Feb. 9, 1926, finally bore fruit in the promulgation of a new customs tariff which went into effect on Oct. 26, 1927, and effected a sweeping revision of both the text and the rates of duties assessed under the former tariff, which dated from the Spanish régime. According to the commission's announcement, the new tariff was in the nature of an experiment. The tariff commission stated in the "exposition of motives" prefixed to the text of the tariff that it made a thorough study of the tariff systems of the leading countries of the world in an endeavor to resolve upon a tariff that should be soundly scientific in that while it should afford protection to domestic industries already established and give encouragement toward the foundation of such industries as are considered necessary to the progress of the country, it should at the same time not interfere with the legitimate flow of import trade in articles not competitive with those of domestic production. In the words of the commission, "Industrial protection has been undertaken with great prudence. A rate of 25 per cent of the value of the article has been in a few cases exceeded and even this margin must be considered reduced by the amount of duty charged on raw materials."

FINANCE. The state budget for the fiscal year 1926-27, as signed by the president on June 28, 1926, provided for estimated revenues of \$86,733,100 and expenditures of \$86,143,182. A comparison of the budget for 1926-27 with that of 1925-26 discloses an increase in both expenditures and receipts of approximately \$2,000,000. The debt of the republic on Sept. 30, 1925, amounted to \$97,875,400, of which \$86,110,200 were foreign debt.

COMMUNICATIONS. Decreases in traffic over Cuban railroads are shown for the year 1926 consequent upon the severe crisis affecting the sugar industry. In making comparisons with the previous year, however, it should be borne in mind that the sugar crop of 1925, amounting to over 5,000,000 tons, reached a record volume. The annual statement of the United Railways of Habana for the fiscal year ended June 30, 1926, showed a decrease in gross receipts by \$1,019,511 and a decrease in operating expenses by \$77,890 as compared with 1925. Goods and livestock traffic dropped from 16,783,215 tons in 1925 to 13,954,591 tons in 1926. Gross receipts of the Cuba Railroad Co. decreased from \$6,422,828 for the fiscal year 1924-25 to \$4,982,464 for the fiscal year 1925-26. No new construction of importance was undertaken in 1926 on Cuban railways. The total mileage open to public service in the island during the year was 3040, all privately owned and operated.

GOVERNMENT. Executive power is vested in a president and cabinet; and legislative power in

a congress of two houses, viz., a senate with 24 members and a house of representatives with 118 members. President in 1927, Gen. Gerardo Machado, inaugurated May 20, 1925; term expires May 20, 1929; vice president, Carlos de la Rosa.

HISTORY. On June 22, President Machado signed a decree approving a bill for constitutional amendments, this project having been previously voted upon favorably by both houses of Congress. Cuban law provides that six months after a resolution to amend the constitution has been passed by two-thirds of the total number of members of the Senate and House of Representatives a constitutional convention must be called for the specific purpose of either approving or rejecting the amendments. Delegates to the convention are elected by each province at the rate of one for each 50,000 inhabitants. The election of delegates to the convention for studying the present amendment will take place in February, 1928, and the convention will meet in March of the same year. One of the amendments increases the length of the Chief Executive's term of office from four to six years.

At the meeting of the Eighth Assembly of the League of Nations in September, Cuba was voted a non-permanent seat on the Council of the League of Nations. Of the nine non-permanent Council seats, four were held by American nations, Canada, Chile, Colombia, and Cuba. See LEAGUE OF NATIONS.

In the latter part of April and May President Machado made an extended visit to the United States, during which he was entertained by the President of the United States and Secretary of State Kellogg, as well as by various civic and political bodies. Among his remarks may be mentioned his belief that a modification of the Platt amendment regulating the relations of Cuba with the rest of the world could very well be modified to the benefit of both countries. He often expressed his admiration for the United States and was very hopeful of the outcome of the Pan-American meeting to be held in his republic early in 1928.

On November 23, Noble Brandon Judah of Chicago was appointed United States ambassador to Cuba to take the place of Maj.-Gen. Enoch H. Crowder, U. S. A., whose resignation was announced in Washington on April 12, to take effect on September 1. General Crowder had represented the United States at Havana since 1923.

CULTURE. See ANTHROPOLOGY.
CUMBERLAND PRESBYTERIAN CHURCH. A branch of the Presbyterian Church, originally the Cumberland Presbytery of Kentucky. It was formed in 1810, when the so-called anti-revival party of the church objected to the admission into the ministry of men who were not up to the usual literary and

theological standards and to the doctrine of fatality as taught in the third and tenth chapters of the Westminster Confession of Faith. Its chief strength was in the Southern States, in consequence of which it was barely saved from disunion during the slavery dispute at the time of the Civil War. This situation led to the establishment of the Colored Cumberland Presbyterian Church (see below). A general Assembly which meets annually is the supreme judiciary. In 1927 the denomination comprised 11 synods and 62 presbyteries, and there were 1209 churches, reporting 753 ministers, and a church membership of 56,161. The property was valued at \$3,052,210, not including \$500,000 endowment for education. There were 1400 Sunday schools, with an enrollment of 48,000. Missionary work was carried on among the Indians in the United States, and churches were maintained in China, where there was an organized presbytery at Canton with eight churches in South China.

During the year missionary work was opened up in South America. The denomination carried on educational work under the direction of the Board of Education and maintained Bethel College and the Cumberland Presbyterian Theological Seminary, both at McKenzie, Tenn. *The Cumberland Presbyterian*, published at Nashville, is the official organ of the Church. The 1927 National Meeting was held at Lakeland, Florida, and the 1928 meeting was announced for June 10-25, at Jackson, Tenn. The Rev. Thomas A. De Vore, Bowling Green, Ky., was moderator of the General Assembly, and the Rev. D. W. Fooks, Nashville, Tenn., was stated clerk and treasurer.

CUMBERLAND PRESBYTERIAN CHURCH, COLORED. A branch of the Cumberland Presbyterian Church which was legally set apart as a separate unit in 1869. The membership of 178 churches of the denomination for which figures were given in the United States census of religious bodies of 1926 was 10,868, as compared with 136 churches and 13,077 members in 1916. In 152 churches reporting Sunday schools there were over 5000 scholars and 840 officers and teachers, as against 7471 scholars and 928 teachers and officers in 1916. The total expenditures of 167 churches in 1926 amounted to \$80,804, of which \$70,437 was for current expenses and improvements and \$9867 for benevolences, missions, etc.; while 127 churches reported in 1926 total expenditures of \$39,497. The value of church edifices, including furniture and equipment, as reported by 162 churches, was \$353,825 in 1926, as compared with \$230,426 reported by 130 churches in 1916. Of the 178 churches reporting in 1926, 60 were in urban communities and 118 were in rural districts.

CURAÇAO, KŌŌŕā-sā'ŏ. A Dutch colony in the West Indies consisting of two groups of islands about 500 miles apart, one of them comprising the islands of Curaçao, Bonaire, and Aruba, and the other consisting of the southern part of St. Martin (the northern part belongs to France), St. Eustache, and Saba. Area, 403 square miles; population, Dec. 31, 1925, 58,931, of whom 35,062 were on the island of Curaçao. The capital is Willemstad, on the island of Curaçao, with a population of 16,684. In 1925 there were 52,679 Roman Catholics, 5605 Protestants, and 448 Jews. The movement of popula-

tion in 1925 was: Births, 2034; deaths, 811; marriages, 448. In the same year there were 44 schools with 8680 pupils. The chief products of the colony are maize, beans, pulse, cattle, salt, and phosphate of lime. The chief industry is oil-refining. The crude oil is imported from Venezuela and Mexico. In 1925 the imports were valued at 70,507,241 guilders and the exports, 59,646,537 guilders; 5606 vessels of 13,105,820 tons entered the ports of the colony in 1925. In 1927 the budget revenue was estimated at 2,897,650 guilders and the expenditure at 2,732,685 guilders. The difference is made up by the mother country. The colony is administered by a governor aided by a council and a colonial council, the members of both being nominated by the sovereign. Governor in 1927, Dr. N. J. L. Brantjes.

CURRENCY. See COINS, VALUE OF FOREIGN; FINANCIAL REVIEW; UNITED STATES.

CURWOOD, JAMES OLIVER. American author, died at Owosso, Mich., August 13. He was born at Owosso, June 12, 1878, and was educated in the literary department of the University of Michigan. At an early age he took up newspaper work, and was assistant editor and editor of the *News-Tribune* of Detroit, resigning to take up literary work exclusively. Spending as he did several months each year in the wilds of the Canadian Northwest, he became an authority on matters pertaining to that region, having traveled as far north as the Arctic coast. These travels, naturally, were reflected in his writings, which included: *The Courage of Captain Plum* (1908); *The Wolf Hunters* (1908); *The Great Lakes* (1909); *The Gold Hunters* (1909); *The Danger Trail* (1910); *The Honor of the Big Snows* (1911); *Philip Steele, of the Royal Mounted* (1911); *Flower of the North* (1912); *Isobel* (1913); *Kazan* (1914); *God's Country and the Woman* (1915); *The Hunted Woman* (1916); *The Grizzly King* (1917); *Baree, Son of Kazan* (1917); *The Courage of Marge O'Doone* (1918); *Nomads of the North* (1919); *The River's End* (1919); *The Valley of Silent Men* (1920); *The Flaming Forest* (1921); *The Country Beyond* (1922); *The Alaskan* (1923); *A Gentleman of Courage* (1924); *The Ancient Highway* (1925), and *The Black Hunter* (1926).

CURZON, FRANK. British theatrical manager and owner of racehorses, died at Newmarket, July 2. He was born at Wavertree, Liverpool, Sept. 17, 1868. He first went into business but later took up acting, and at the age of 24 appeared in London in *Queer Street* at the old Terry's Theatre. In 1899, with Charles Hawtrey, he took the Avenue Theatre, later the Playhouse, where he produced a number of notable successes. Later he assumed the management of the Strand Theatre and the Prince of Wales, and by the year 1903 he was in control of a chain of theatres, though most of these he relinquished and at the time of his death he had Wyndham's and the Playhouse only. In addition to his theatrical ventures he owned a number of racehorses, including Gall Boy, the Derby winner in 1927. He died soon after the race was run.

CUTLER, JAMES GOOD. American banker and manufacturer, died at Rochester, N. Y., April 21. He was born at Albany, N. Y., Apr. 24, 1848, and was educated at Albany Academy, following the profession of architecture until 1894, when he retired from practice. In 1872 he had moved to Rochester, and while there in-

vented and developed the mail chute for transferring mail in large buildings. He also was interested in banking, being the first vice president of the Lincoln Alliance of Rochester, and later president and chairman of the board of the executive committee. He was also a trustee of the Rochester Savings Bank. His interest in public affairs was shown by his membership on the White charter commission in 1895, which proposed a uniform charter for second-class cities of New York State, and in 1896 and 1916 he served as a Republican presidential elector. In 1897 he was appointed consulting architect for the New York State Capitol building. In 1900 Mr. Cutler was commissioner of public safety for Rochester, and from 1904-07 mayor of that city, being twice elected on the Republican ticket. He was president of the Rochester Chamber of Commerce in 1896, trustee of the University of Rochester, president of the Municipal Art Commission, and of the City Planning Advisory Board until 1922. He was a trustee of the Rochester Bureau of Municipal Research, and president of the Western New York State Association of Architects. In his latter life he had been forced by illness to restrict his many public activities.

CUZANIAN, ANTRANIK. Armenian soldier, died at Richardson Hot Springs, Cal., August 31. He was born in Armenia in 1866, and at the age of 23 gave up his trade as a carpenter to enter the Armenian army, in which he fought against the Turks for many years. In 1914 he increased his small army, and fought with the Russians against the Turks, being made a major general and decorated six times for gallantry. On the collapse of the Russian army, he made use of their abandoned military stores and was commander-in-chief of the allied forces operating in the Near East until he relinquished the command to General Allenby and returned to the command of the Armenian army. At the close of the World War he was operating in Persia against the Turkish 36th division. He had fought in 59 engagements against the Turks yet was never wounded in battle, although several horses were shot under him. In 1920 he went to the United States to urge Armenians who had settled there to give financial and moral support to their homeland, and later settled there permanently. He was considered by the Armenians the world over their greatest soldier and hero.

CYCLING. Both outdoor and indoor cycling increased in popularity in 1927, the races at the New York Velodrome attracting the largest crowds in the history of the sport, while the December six-day race at Madison Square Garden in the same city drew a total of 150,000 spectators, 21,000 being on hand at the finish of the "grind."

Franco Georgetti of Italy was the leading rider of the year among the professionals, winning three of the five American six-day events as well as the motor-paced championship. Only two champions succeeded in retaining their titles. Victor Linert of Belgium captured the world's motor-paced championship for the second successive year and Cecil Walker of Australia won the all-around American title for the fourth year in a row.

James Walthour, Jr., proved the best amateur rider of 1927, capturing the national sprint, road and all-around championships.

CYPRUS. A British island, situated 40 miles from the coast of Asia Minor and 60 from the coast of Syria; the third largest island in the Mediterranean Sea. Area, 3584 square miles; population, according to the census of 1921, 310,700, of whom 61,422 were Mohammedans. Capital, Nicosia, with a population of 18,461. In 1925 there were 852 elementary schools with 1126 teachers and an enrollment of 47,515, of whom 38,195 were Greek-Christian. With about one-third of the arable land under cultivation, agriculture forms the chief occupation of the people of the island. Forestry and the cultivation of the vine are rapidly taking an important place in the production of wealth on the island. Among the principal agricultural products are wheat, barley, oats, potatoes, linseed, cotton, animal products and fruit. Asbestos and copper are mined and exported in considerable quantities.

The merchandise imported in 1925 was valued at £1,583,198; exported, £1,198,615. The revenue for the same year was £608,131 and the expenditure, £619,621. The total shipping which entered and cleared amounted to 1,333,308 tons in 1925. The island was administered under a convention with Turkey by Great Britain after June 4, 1878, and was annexed by Great Britain at the outbreak of the war with Turkey on Nov. 5, 1914. It is under a high commissioner having the usual powers of a colonial governor, aided by an executive council and a legislative council of 24 members of whom nine are office-holders and the remainder elected for five years, 12 of them by non-Mohammedan voters and three by Mohammedan voters. On May 1, 1925, the island was given the status of a colony. Governor during 1927, Sir Ronald Storrs.

CYRENAICA. A colony belonging to Italy on the north coast of Africa; until 1919 it formed a part of Libya; in that year, for administrative and military purposes, Libya was divided up into Cyrenaica and Tripolitania (q.v.). The area is estimated at about, 285,640 square miles; population, according to the census of 1921, about 220,000 natives, and 9719 Europeans (9402 Italians). Benghazi is the principal town with a population of 30,000. The chief occupation of the people is agriculture, although there are vast possibilities for cattle raising. Barley and wheat are the chief products. The former is the chief food of the people. In 1923 the imports were 70,811,245 lire and the exports 17,608,774 lire. The principal imports are cotton goods and sugar and the principal exports, sponges and barley (7,430,623 lire in 1924). The internal commerce consists mainly of caravan trade between Benghazi and Wadi. For 1925-26 the revenue and expenditure were estimated at: Colonial revenue, 161,825,000 lire; civil expenditure, 53,000,000 lire; military expenditure, 108,825,000 lire. Governor during 1927, S. E. Attilio Teruzzi (appointed Dec. 2, 1926). See **ARCHAEOLOGY**.

CZECHOSLOVAKIA, *chěko-slová'kia.* An eastern European republic, formed Oct. 28, 1918, out of the Slav regions of the old Austro-Hungarian Empire; formally dedicated a republic, Nov. 14, 1918; comprising the former Austro-Hungarian provinces of Bohemia, Moravia, Silesia, Slovakia, and Ruthenia, together with the portion of the Teschen district assigned to Czechoslovakia at the Ambassadors' Conference, July 28, 1920, Capital, Prague.

AREA AND POPULATION. The total area of Czechoslovakia is 54,207 square miles. The population at the census of Feb. 15, 1921, was 13,613,172. By race it was distributed as follows: Czechoslovaks, 8,760,937 (65.5 per cent); Germans, 3,123,568 (23.3 per cent); Magyars, 745,431 (5.5 per cent); Russians, 461,849 (3.4 per cent); Jews, 180,855 (1.3 per cent); Poles, 75,853 (0.5 per cent); others, 25,871 (0.2 per cent). There were besides 238,808 aliens. The Czechoslovaks and Germans made up almost exclusively the population of Bohemia and Moravia, and the Czechoslovaks about half of Silesia and more than two-thirds of Slovakia. The largest cities with their populations in 1921 are: Prague, 676,657; Brno, 221,758; Ostrava, 113,709; and Bratislava, 93,189. The majority of the people are Roman Catholics, who numbered 10,383,533 in 1921.

EDUCATION. Elementary instruction is compulsory between the ages of six and 14. In 1925 there were 13,984 public and elementary private schools, with 688,796 boys and 703,329 girls and 1702 public and private higher-grade schools with 172,168 boys and 149,360 girls. During the school year 1925-26 there were 377 secondary Latin and technical schools with 105,356 pupils. There are four universities as follows: Prague (Czech), with 8195 students; Prague (German), 3527; Brno (Czech), 1671; and Bratislava (Slovak), 1251.

PRODUCTION. The soil of Czechoslovakia is naturally fertile, especially in the lower part of the country, where the cultivation of beets, wheat, barley, rye, and oats is carried on quite extensively. In 1925 there were 14,605,000 acres of arable land, 6,379,000 acres of meadows and pastures, 404,000 acres of gardens and vineyards, and 11,496,000 acres of forests. The following table shows the area and production of the principal crops:

AREA AND PRODUCTION OF PRINCIPAL CROPS
[Figures in thousands]

Crop	1925	
	Acres	Bushels
Wheat	1,526	89,809
Rye	2,091	58,098
Barley	1,714	57,208
Oats	2,068	89,863
Corn	887	12,048
Potatoes	1,580	275,522
Sugar beets	760	11,028*
Hops	25	14,415*
Grapes	41	
Hemp	29	21,148*
Flax	61	80,137*

* Thousands of metric tons.

* Thousands of pounds.

Sugar production, one of the principal industries of the country, had been steadily rising since 1921, until it reached a record level of 1,509,000 metric tons for the 1925-26 season which ended September 30. It was estimated that the output for 1926-27 would be materially smaller owing in part to a restriction in area devoted to sugar beets and in part to unfavorable weather. Low prices which prevailed during the year were responsible in a large measure for the restriction in cultivation. The coal resources consist of several hard-coal fields and lignite basins, the largest of which are situated in northern Moravia and Silesia and in northwestern Bohemia. The coal industry profited very much as a result of the British strike, and it seemed certain that the 1926 production would

greatly exceed the 1925 figure of 12,753,000 metric tons.

The manufacture of glass is one of the oldest industries in the country. It is estimated that the factories have an annual manufacturing capacity of 415,000 tons of hollow glass, 132,000 tons of plate and window glass, and 187,000 tons of special glass. The fact that the domestic market absorbs only 20 per cent of the entire production makes it necessary for the industry to depend upon export trade for its existence. In recent years, however, the situation of the industry has been adversely affected by a variety of causes, notably high protective tariffs and the keen competition of certain European countries with depreciated currencies. The production of iron and steel amounts to approximately one-half of the output of the old Austro-Hungarian Empire, but whereas the former empire consumed practically all its production, Czechoslovakia needs only about 50 per cent of its output. Other important and active industries of the country are the manufacture of china and textiles, leather working, and brewing.

COMMERCE. When Czechoslovakia became an independent state it held within its borders approximately 80 per cent of the industries of the former Austro-Hungarian Empire. It is easy to understand that a population of some 14,000,000 could not possibly absorb the entire output of this industrial organization, and as a result most, if not all, of the industries are dependent upon a successful export trade, it might be said, for their very existence. Up to the present time Czechoslovakia has met with gratifying results in its efforts to find foreign markets for its goods. The balance of trade has steadily remained favorable, even in the face of increasing competition and depreciated currencies in neighboring countries. The following table shows the principal articles of import and export in the foreign trade for 1925. Value is given only, as the quantity of a large number of articles

PRINCIPAL CZECHOSLOVAK IMPORTS AND EXPORTS
[In thousands of crowns]

Articles		1925
IMPORTS		
Raw cotton	2,795,028	
Cotton goods and yarn	425,744

Paper and paper goods	321,676	

is expressed in "pieces," without tonnage figures, and comparisons on this basis would be of little use.

Preliminary reports for 1926 showed imports valued at 15,263,000,000 crowns (\$457,890,000) and exports at 17,858,000,000 crowns (\$535,700,000). While the favorable balance for 1926 is larger than in 1925 it was achieved with smaller volume of trade than in the previous year, owing to the condition of depression which generally prevailed throughout 1926. The trade with the United States in 1926 showed exports to the United States valued at 845,100,000 crowns and imports from the United States valued at 759,500,000 crowns.

FINANCE. The total authorized expenditures for actual state administration in 1927 amounted to 9,703,505,000 crowns, while receipts were estimated at 9,723,915,000 crowns, this showing an anticipated surplus of 20,410,000 crowns. The total expenditure is subdivided in the following manner:

AUTHORIZED BUDGET EXPENDITURES, 1927

Purposes	Expenditures in thousands of crowns	Per cent of total
Central State authorities (President, Parliament, Cabinet)	89,016	.96
Foreign affairs and army	1,506,005	19.68
Internal administration (interior, justice, social welfare, economic policy, transportation, education, etc.)	4,196,006	45.84
Finance administration	3,908,106	83.97
Supreme accounting office	4,872	.05
Total	9,703,505	100.00

The following table shows the status of the Czechoslovak national debt, together with expenditures to be met in the year 1927 for its service:

NATIONAL DEBT [Amount in thousands of crowns]

Item	Capital	Interest	Service for 1927	
			Amortization	Total
Internal debt	24,049,196	1,388,938	523,891	1,857,824
Foreign debt	6,495,829	310,682	91,464	402,146
Debts arising from peace treaties	4,400,000	260,000	260,000
Administrative expenses	52,968
Total	84,945,025	1,904,615	615,355	2,572,938

COMMUNICATIONS. The length of the Czechoslovak State railways at the close of 1926 totaled 11,032 kilometers, of which 7246 kilometers were main line and 3786 kilometers branch line.

In addition the State railways were operating, for the account of private owners, 2308 kilometers of track. Operating revenues of the State Railways in 1926 amounted to 4,005,834,000 crowns and other revenues to 206,586,000 crowns, while operating expenses reached 3,642,745,000 crowns and other expenses 447,149,000. According to preliminary returns, operating revenues for the first half of 1927 (430,446,000 crowns from passengers and baggage service and 1,456,692,000 crowns from freight service) showed an improvement—the more marked as the heaviest traffic occurs in the autumn. The rolling stock in operation on July 1, 1926, comprised 8319 locomotives, 112,886 freight cars and 8494 passenger cars. The general condition

of the equipment was considered satisfactory, though rolling stock was not quite up to western European standard. During 1927 the ministry of railways planned to scrap 110 locomotives of low efficiency and uneconomical maintenance, and expected to purchase 38 steam locomotives and 12 electric locomotives (the latter for service on the railway stations in the city of Prague); 120 passenger cars and 2583 freight cars were also to be scrapped and 133 new passenger cars were to be purchased. Present electrification was limited to the suburban lines at Prague (53 kilometers in length), where completion was expected in May, 1928.

GOVERNMENT. According to the constitution passed by the National Assembly, Feb. 29, 1920, executive power is vested in a president, elected for seven years by the two chambers in joint session, who appoints and recalls his ministers; and legislative power in a senate of 150 members and a chamber of deputies of 300 members, the former elected by all citizens over the age of 26 and the latter by all citizens over the age of 21. The principle of proportional representation is applied. President in 1927, Thomas G. Masaryk (elected May 28, 1920; reelected May 27, 1927). The Czechoslovak government, appointed on Oct. 12, 1926, consisted of the following ministers: Prime Minister, Antonin Švehla; Foreign Affairs, Dr. Eduard Beneš; Finance, Dr. K. Engliš; Interior, J. Černý; Commerce, F. Peroutka; Public Works, Dr. Fr. Spina; Railways, J. Najman; Social Welfare, Jan Šrámek; Justice, Dr. R. Mavr-Harting; Agriculture, Dr. O. Srdínko; Education, Dr. M. Hodža; National Defense, F. Urdžal; Posts and Telegraphs, Dr. F. Nosek; Health, M. Tiso (January, 1927); Unification of Laws, M. Gazhik.

HISTORY. The outstanding event of the year was the reelection of President Thomas Garrigue Masaryk to a second term of seven years on May 27. His election was not unanimous by any means. According to the constitution the president is elected by the national assembly. About 50 Communists voted against Masaryk and more than 100 ballots were turned in blank. In a speech delivered on October 28 in celebration of the ninth anniversary of the founding of the republic President Masaryk stated that land reform was the country's greatest need at the present time. "The agrarian reform will soon be completed in the historic sections of the country; in Slovakia and Carpatho-Russia more work remains to be done. Next to the revolution, the land reform is the greatest deed of the new republic; it is the crowning work and the genuine realization of the revolution.

"After the war there were hunger and misery in our country, too, and the people looked askance at the huge landed estates. By means of the law of sequestration we forestalled social explosions, as the people received the hope of obtaining land. And in reality the land reform had this satisfying effect at the beginning. In other places, for example in England, it was different. While with us not a hair of the big landowner's head was touched, in Ireland some of them were slain before the reform was put through. And in other places—not only in Russia—the land reform was carried out quite differently than with us. In our case at least 80 per cent of the change in land ownership was made voluntarily and in agreement.

"I understand that the big landowners gave up their privileges unwillingly; and still this reform has served the interests of the large landholders, especially the nobles, not only morally, but economically, by forcing them to take up actual agricultural work and to adopt an enterprising spirit.

"Regarding our position abroad, I am able to point out with pleasure that it shows successes and that they are loyally recognized by other countries, both great and small. This is of great value to us, for we need the recognition and good will of other nations for our consolidation; domestic policies are all too closely linked with foreign policies. Our foreign policy demands and will demand caution, and certainly also understanding of the shifting European situation. The internal conditions of all countries are changing. The vanquished and the victors have suffered through the war, but there is already a consolidation in sight, particularly in Germany. I have often pointed out already that we must take into consideration not the defeated, but the revived and powerful Germany.

"I have never blinded myself to the fact that the peace agreements and particularly the new division of Europe are not perfect in all details, for they are the work of human beings. But it may be asserted with certainty that the post-war organization of Europe is more just than the pre-war organization was. There can be negotiations over the details of a correction, but this must be done in an expert and just way, not through agitation. And the negotiations must be carried on between the States. The peace treaties will not be disturbed, for we cannot allow them to become scraps of paper and general insecurity and de facto anarchy to prevail.

"Decent, honorable men can reach an essential agreement on any and all problems, even the most difficult. This was properly borne in mind in the programme of the League of Nations."

DA CUNHA (kôvnyá) **GASTAO**. Brazilian statesman and publicist, died at Rio de Janeiro, July 5. He was for many years a leading figure in the diplomatic life of Brazil, serving as Brazilian ambassador to Portugal and to the Vatican, and in 1919 was appointed ambassador to Italy. In 1920 he was transferred to France as ambassador, and in the following January participated in the organization of the League of Nations, being a member of its Council. In 1921 he became president of the Council of the League, serving again as president in the following year, but through a stroke of paralysis was unable to preside over the opening sessions of the third meeting of the League of Nations, which occurred late in the summer of that year.

DAGGETT, MRS. MABEL POTTER. American author, died at New York City, November 13. Born at Syracuse, N. Y., the daughter of Albert P. and Sara Louise Potter, she graduated from Syracuse University in 1895, and entered newspaper work. She was editor of the woman's page of the *Post-Standard* of Syracuse, 1895-1900, and of the *Sunday North American* of Philadelphia, 1900-01, when she married John Duval Daggett. She was a special writer and editor for a number of magazines, and was prominent in the movement for woman suffrage. She was special commissioner to France for the Butterick Publishing Company, and was active in the French war relief in 1919. She was the author of: *In*

Lockerbie Street, A Little Appreciation of James Whitcomb Riley (1909); *Women Wanted* (1918); and *Marie of Rumania* (1926) based on a visit to the Queen.

DAHOMÉY, dâ-hô'mî. A French colony on the west coast of Africa between Togoland on the west, the British possessions of Lagos and Nigeria on the east, and the French military territories on the north. It is a subdivision of the colony of French West Africa (q.v.). The colony has only about 70 miles of coast, but opens out northwards into a wide hinterland. Area, 42,460 square miles; population, according to the census of 1925, 979,609, of whom 900 were Europeans. The chief centre of trade and the seat of the government is Porto Novo with a population of about 20,000. The population is of pure negro blood, and belong to the Ewe family. They are very industrious and engage mainly in agriculture. In the coastal region they raise potatoes, corn, manioc, and yams. In the central provinces, cotton culture has been introduced. The forests contain oil palms of commercial importance. The chief exports are palm oil and palm kernels. The local budget for 1926 was 19,102,000 francs.

DAIRYING. The dairy industry in the United States enjoyed another good year in 1927. Consumption of butter and fluid milk increased sufficiently to absorb an increase in production averaging about 4,000,000 pounds of milk annually in recent years. The production of condensed and evaporated milk increased approximately 11 per cent in 1927, as compared with 1926, while consumption increased about 3 per cent. The production of cheese declined approximately 6 per cent, due in part to increased demand for milk for other uses. The apparent consumption of cheese showed little change. Existing tariff regulations on butter were effective in preventing importation, though at the beginning of the year small amounts were received from the southern hemisphere when stocks on hand were unusually low and the price was relatively high as compared with European markets. But in the summer domestic stocks were replenished to such an extent that there was some concern about the maintenance of satisfactory prices. The large stocks on hand were not confined to butter as there were also relatively large stores of canned milk and cheese. In the fall and winter the stocks of dairy products were, however, normally reduced without significant effect on prices.

The organizations of producers have been effective for a number of years in the fluid milk sections in maintaining stable prices for milk, and, with the increased tariff effective in 1926 on butter and cheese, dairymen appeared to be established in a well founded industry which depends upon domestic consumption for the disposal of its products.

During 1927 the United States exported only 4,343,142 pounds of butter and 3,410,353 pounds of cheese, and this went almost entirely to countries of South and Central America and the West Indies. The exports of condensed, evaporated and powdered milk totaled about 106,353,820 pounds in 1927, which was approximately 10 per cent less than in 1926. Canned milk was exported mostly to various European countries, particularly Great Britain and the Orient where the possibilities of developing an export trade in canned milk appear promising

should the need for disposal of surplus dairy products exist.

Cheese is the only dairy product imported in appreciable amounts. Some 79,796,042 pounds of cheese were imported in 1927, consisting mainly of special types from Italy and Switzerland. There was an approximate 10 per cent increase in the 1927 imports as compared with 1926, due in part to increases from Canada and Switzerland.

INTERNATIONAL CONDITIONS. Of outstanding interest in the international dairy situation during 1927, was the heavy production of dairy products by practically all of the European countries. Butter exports of Denmark were about 8 per cent heavier than in 1926 and probably the largest on record. Butter production in Russia increased but the expansion of the industry was not quite as great as had been anticipated. Exports of butter and cheese and condensed milk from The Netherlands were the largest on record, and butter production in Sweden was greater than in 1926 and practically equal to pre-war level. The combined European supplies were estimated at approximately 13,000,000 pounds heavier than in 1926.

Notwithstanding the relatively heavy production of dairy products in the European countries the total quantities of European butter reaching Great Britain during the season of heavy production, May 1 to October 1, were almost identical with those of 1926, 271,000,000 pounds. This was due in part to the heavy German imports which averaged 11 per cent greater for butter and 17 per cent greater for cheese in 1927 than in 1926.

The production of dairy products in the southern hemisphere has in recent years been a very significant factor in European supplies. During 1927, production was considerably reduced as a result of drought conditions in the late spring in Australia and Argentina, and shipments from these sources to the British markets were almost negligible during September and October when the season of heavy production is ordinarily beginning. There was, however, considerable recovery in the last two months of the year in both countries, and conditions in New Zealand, the other main source of butter and cheese from the southern hemisphere, were even better than in 1926. With the approach of the season of heavy production in the southern hemisphere there is usually some butter attracted to the United States but though the price difference between domestic and European markets approached the import duty of 12 cents per pound, the margin did not exceed this figure sufficiently to attract any significant supplies, probably because the heavy storage in the United States and further British markets were prepared to absorb any surplus at a favorable price.

The competition which Swiss cheese has encountered in the world markets from other countries, including the United States, which produced cheese of the Swiss types, has tended to shift interest from cheese to other dairy products, more especially butter, in Switzerland. The federal government appropriated 1,000,000 francs annually for the assistance of the dairy industry, primarily to help in the development of butter manufacturing, and to offset any deficit resulting from guaranteed butter prices. By these means the production of butter considerably increased and importation decreased.

The pooling of New Zealand butter and cheese was done away with in 1927, following the abandonment of any form of price fixing by the New Zealand Dairy Produce Control Board, and butter and cheese were sold in a free market, except that the Board continued to supervise the quality of export products.

TRENDS OF RESEARCH. Research in the production phases of dairying was either directly or indirectly concerned with the factors influencing milk secretion, which has been found to be very complicated in its reaction to various conditions or combinations of conditions. Much progress has been made toward the solution of certain of these problems at the State agricultural experiment stations by dividing the broader study of milk production into its component parts and limiting individual studies to such portions of the problem as initial production immediately after calving; the persistence with which production of fat or milk, or per cent of fat in the milk, is maintained over the entire lactation period; the energy produced in the milk; size of the fat globules; melting point of fat, and the like.

By attacking the problem in this manner the Minnesota and Illinois agricultural experiment stations found that the fat content of the milk could be increased by feeds or rations high in oil, the oil itself being responsible for raising the fat content of the milk, and not the additional energy supplied or the specific action of the feeds. In studies of the inheritance of the capacity to produce large amounts of milk and butterfat, the Illinois Experiment Station found that the limiting factor in milk production was the energy produced in the milk. Physiological studies of milk secretion at the Maine and Missouri experiment stations indicated that from 70 to 80 per cent of the milk produced at a single milking was present in the udder before milking started, while the balance was secreted from cells of the mammary gland as the stimulation of the milking proceeded.

Studies at the Pennsylvania and Minnesota experiment stations showed that dairy calves, unlike many other animals, were able to make normal growth and produce young on rations lacking in Vitamin B, due to their ability to synthesize this substance in their digestive tract from the action of the fermentation bacteria normally present. Cows were, however, unable to synthesize sufficient Vitamin B in this way to maintain normal milk production.

The Iowa Experiment Station conducted extensive studies of the different organisms associated in starters used in the ripening of cream for butter-making. The action of these organisms was studied singly and in combination as to their products and also as to the particular influence of each on the flavor and quality of the butter. Certain bacteria are active at first in the ripening process and raise the acidity of the cream. After a certain acid content is reached the action of this group is attenuated and other types develop more rapidly. This explains why acidity is such a common indicator of the proper stage of ripening for cream, and yet the proper degree of acidity may differ with different starters. These studies thus throw light on the irregularities in the quality of butter produced from time to time by particular plants, using a common starter, and the need of getting new

starter cultures when such become contaminated with undesirable bacteria.

For a number of years several of the state agricultural experiment stations have been working on the effect of the various ingredients of ice cream mixes on the freezing point, overrun, shrinkage, and quality and flavor of the finished product. While the principal effects of the various ingredients have been pretty well worked out, the differences in the demand between individuals and localities make general recommendations more a matter of local preference, much in conformity with that to which a community or particular trade has become accustomed. The Massachusetts Agricultural Experiment Station found the shrinkage of ice cream dipped from bulk averaged about one-third of the original volume, but the care of the person dipping was more important than the composition of the mix in its effect on shrinkage.

CHANGES IN PERSONNEL. Dr. C. W. Larson, who was chief of the Bureau of Dairying in the U. S. Department of Agriculture from its creation, July 1, 1924, resigned Dec. 31, 1927, to accept the position of Director of the National Dairy Council, which represents many phases of the dairy industry and is devoted to the promotion of health and child welfare through the education of the public in dairy matters. Dr. H. C. Jackson, Associate Dairy Manufacturing Specialist, in the Bureau of Dairying, U. S. Department of Agriculture, was appointed Chairman of the Dairy Department at the University of Wisconsin to succeed Dr. E. H. Farrington, who was appointed Professor Emeritus of Dairy Husbandry, after 33 years' service as head of the department. Cornell University obtained the services of Dr. Otto Rahn, formerly head of the Dairy Department in the Agricultural Experiment Station at Kiel, Germany, to become Professor of Bacteriology.

BIBLIOGRAPHY. The more important reference books on dairying recently published include: G. H. Garrad, *The Principles of Dairy-Farming* (London, 1926); P. Dechambre, *La Vache Laitière* (Paris, 1926, 3d ed. rev.); J. A. S. Watson, J. Cameron, and G. H. Garrad, *The Cattle-breeder's Handbook* (London, 1926); E. H. Farrington, *A Guide to Quality in Dairy Products* (Madison, Wis., 1927); K. Teichert, *Methoden zur Untersuchung von Milch und Milcherzeugnissen* (Stuttgart, 1927, 2d ed. rev.); H. E. Ross, *The Care and Handling of Milk* (New York and London, 1927); W. Grimmer, *Lehrbuch der Chemie und Physiologie der Milch* (Berlin, 1926, 2d ed. rev.); A. T. R. Mattick, *The Production and Distribution of Clean Milk* (London, 1927); O. F. Hunziker, *The Butter Industry* (LaGrange, Ill., 1927, 2d ed.); M. Beau and C. Bourgain, *L'Industrie Fromagère* (Paris, 1926); L. L. Van Slyke and W. V. Price, *Cheese* (New York and London, 1927); C. D. Dahle, *A Manual for Ice Cream Makers* (Atlanta, Ga., 1927).

DALL, WILLIAM HEALEY. American naturalist, died in Washington, D. C., March 27. He was born in Boston, Mass., Aug. 21, 1845, and after a public school education became a student under Prof. Louis Agassiz. He took special courses in anatomy and medicine. In 1865 he accompanied the International Telegraph Expedition to Alaska, remaining until 1868. In 1871-84 he was with the United States Coast Survey in Alaska; and in the latter year became paleontologist of that organization, a posi-

tion he held until 1925. In 1880 he was appointed honorary curator of the United States National Museum, and in 1893 professor of invertebrate paleontology at the Wagner Institute of Science, Philadelphia, Pa. He was elected a member of the National Academy of Sciences, and was a member of the American Academy of Arts and Sciences and other scientific organizations. In addition to various scientific monographs and papers in learned journals, he wrote: *Tribes of the Extreme Northwest*; *Scientific Results of the Exploration of Alaska: Reports on the Mollusca of the Blake Expedition*; *Alaska and Its Resources*; *Coast Pilot of Alaska*; and a biography of Spencer Fullerton Baird.

DALMATIA. A province of Jugoslavia; a crownland of Austria until the downfall of the Dual Monarchy in 1918. It extends from Bosnia and Herzegovina west to the Adriatic Sea. Area, 4916 square miles; population, according to the census of Jan. 31, 1921, 621,429. Capital, Zara, with a population, in 1921, of 18,060.

DALY, ARNOLD. American actor, died in a fire in his apartment in New York City, January 13. He was born in Brooklyn, N. Y., in 1875, and, after serving as an office boy for Charles Frohman, theatrical manager, made his first appearance with Fannie Rice in 1892 in *The Jolly Squire*. In 1895 he made his New York debut in *Pudd'nhead Wilson*, and soon achieved a reputation as an actor of keen intelligence and charm. After successful engagements in London, he returned to New York, where he introduced the plays of George Bernard Shaw to America. His first effort in this direction was with *Candida*, in 1903; it was produced with his own capital and was a distinct artistic success. This was followed by *Mrs. Warren's Profession* and *You Never Can Tell* in 1904, and later *Arms and the Man* and *The Man of Destiny* in 1906. He played with Madame Simone in *The Return from Jerusalem*, and later in *General John Regan*, 1913-14. Daly acted in vaudeville and motion pictures in order to accumulate means for his own legitimate productions. Among his last performances were those in *The Tavern*, of George M. Cohan, and in *The Emperor Maximilian*, of the Theatre Guild.

DALZELL, JOHN. American politician and for many years a member of the House of Representatives from Pennsylvania; died at Altadena, Cal., October 2. He was born in New York, N. Y., Apr. 19, 1845, and removed to Pittsburgh in 1847. He graduated from Yale in 1865 and was admitted to the bar in 1867. For years he was one of the attorneys of the Pennsylvania R. R. for its western lines, and was attorney for many corporations in Allegheny County, Pennsylvania. He was for 26 years a representative from the 30th Pennsylvania district, being a member of the 50th to the 62nd Congresses, serving as member of the committees on rules, and ways and means, from the 54th to the 62nd Congresses. For many years he was the right-hand man of the Speaker of the House. He was a protectionist, and helped to write the Dingley and the Payne-Aldrich tariff laws. In 1912 he was defeated during the Roosevelt tide, and from that time ceased to be an influence in Republican politics, making a single unsuccessful effort to gain a seat in the Senate. In 1904 and 1908 he was a delegate to the Republican National Convention. He was a regent of the Smithsonian Institution, Washington.

DAMS. UNITED STATES BUREAU OF RECLAMATION. Notable dam construction was carried on during the year by the United States Bureau of Reclamation of the Department of the Interior. There were 117 storage and diversion dams having a combined volume of 20,206,350 cubic yards built by the Bureau which were in operation in 1927.

GUERNSEY DAM. The Guernsey Dam of the North Platte project, Wyoming, a gravel and rock fill structure, with a maximum height of 100 feet and a length of 560 feet and a volume of 400,000 cubic yards, was completed during the year. This dam furnishes stored water and power for the North Platte Irrigation project and was built of sluiced gravel and rock fill. During construction the North Platte River was diverted by means of a diversion tunnel through the south abutment and a portion of this tunnel later was to be used in connection with the south spillway to pass the discharge of two 14.5 feet by 64 feet automatic spillway gates of the drum type. The upper end of the diversion tunnel is used for a settling basin when sand is settled from the power water and the water is wasted through three 5 x 5 foot sluice gates. Penstock tunnels leading away from this basin connect with the power house below the dam. There is also a 50 x 50 foot Stoney gate set in a concrete-lined channel at the north end of the dam. The total spillway capacity is 80,000 cubic feet per second.

McKAY DAM. The important McKay storage dam for the Umatilla project in Oregon was completed at the end of the year. This dam which was described in the YEAR BOOK for 1925, page 195, was a gravel fill with concrete paving having a maximum height of 160 feet, a length of 2600 feet, and a volume of 2,313,000 cubic yards.

GIBSON DAM. The U. S. Reclamation Service awarded a contract for the construction of the Gibson Dam on the Sun River Project, Montana, the price being \$1,566,240. This new dam across the North Fork of Sun River, about 23 miles northwest of Augusta, Mont., provides storage for the Fort Shaw Division to supplement the normal flow of the Sun River which is exhausted normally by July 15. This dam is of the massive concrete arch type with a maximum height of 179 feet, a length of 900 feet and a volume of 167,595 cubic yards of concrete. The outlet work consists of two metal pipes through the dam to be controlled by a hydraulically operated sluice gate and a balanced needle valve installed at the downstream face of the dam. A vertical shaft and a concrete tunnel in the left abutment serve as a spillway. The reservoir formed by this dam was to have a capacity of 105,000 acre-feet and furnish a supplemental supply for 90,000 acres of the Sun River project, of which the distribution system had been completed for about 40,000 acres.

STONY GORGE DAM. Another project of the U. S. Reclamation Service upon which work was begun was the Stony Gorge Dam of the Orland irrigation project, near Fruto, California, referred to in the 1926 YEAR BOOK, page 216, for which the contract was awarded Oct. 2, 1926, at \$518,904, and for which excavation was begun in December of that year. The first concrete for this dam was placed in the month of June, 1927.

This structure is of hollow reinforced concrete with a maximum height of 120 feet, 828 feet in length and with a volume of 38,000 cubic yards, and containing about 1,500,000 pounds of reinforcing steel. The dam was designed of the buttressed type with a reinforced concrete face slab. The main outlet works consist of two metal pipes through the dam, each controlled by a hydraulically operated sluice gate near its upstream end, and a balanced needle valve at its downstream end. A secondary outlet consists of a small needle valve and gate valve. The spillway is located in the central part of the dam and is controlled by three 30 x 30 foot gates. At the end of the year the dam was approximately 60 per cent complete and it was expected to be finished late in 1928. The Stony Gorge reservoir was to have a capacity of 50,200 acre-feet and afford a supplemental supply for 20,000 acres already under irrigation.

ECHO DAM. The Echo Dam under construction across the Weber River, near the town of Echo, Utah, was designed to store water for the Salt Lake Basin irrigation project. This dam consists of an embankment of sand, clay and gravel, sprinkled and rolled, with its upstream face covered with conglomerate riprap and the downstream face with gravel and cobbles. The structure was to be 125 feet in elevation above the stream and 1800 feet in length, the embankment containing about 1,700,000 cubic yards of material. The contract price was \$1,125,008 and it was expected to be completed early in the year 1930.

DEADWOOD DAM. Plans were completed during the year for the Deadwood Dam for the Payette Division of the Boise, Idaho, irrigation project. This dam site was on the Deadwood River, a branch of the Payette River, about 25 miles east of Big Eddy, on the Union Pacific R. R., and here it was planned to construct a concrete arch dam, 160 feet in height, forming a reservoir to store 150,000 acre-feet.

OWYHEE DAM. This important project, involving a dam in the canyon section of the Owyhee River, about 20 miles above its mouth, was designed to provide a reservoir with a storage capacity of 595,000 acre-feet for the Owyhee project which would irrigate about 124,000 acres. This dam was to be about 360 feet in height, or 11 feet higher than the Arrowrock Dam in Idaho, which was the world's highest dam, and plans were under development to determine the best type to be used. Already work had been started on the construction of about 28 miles of railway from the Oregon Short Line, 9 miles north of Adrian, Oregon, to the Owyhee Dam site. Considerable preliminary work had been done in the way of topography and diamond drilling and tentative plans for a concrete arch type of dam, 355 feet high above the foundation, 600 feet on top, composed of 405,000 cubic yards concrete and with a channel spillway with 30,000 second-feet capacity had been prepared.

OHIO RIVER DAMS AND LOCKS. The improvement of the Ohio River for navigation involved the construction of a number of fixed and movable dams with the object of providing a channel depth of nine feet for the entire distance of 968 miles. The total estimated cost of this work, which was carried on by the U. S. Army Corps of Engineers, was \$105,000,000 and up to the end of 1927 about \$89,000,000 had been spent.

The work involved the construction of two fixed and 48 movable dams with navigation locks at each dam with general net dimensions of 110 feet by 600 feet. The navigable passes vary in width from 600 to 1248 feet and are closed by wickets of the Chanoine type. During the year the fixed dam at Deadman's Island, some 13 miles below Pittsburgh, was under construction which was to take the place of the existing dams, Nos. 3 and 4. By 1927, with the exception of the Deadman's Island dam, all of the dams between Pittsburgh and the mouth of the Wabash River had been completed so that there was afforded 839 miles of continuous navigation. Below the Wabash River no dams had been completed, but four were under construction, with one to be started. This stretch included 129 miles. At Louisville, a dam with a maximum head of 37 feet had been completed and was ready for the development of electric power.

In a statement by Gen. Edgar Jadwin, chief of engineers, to the Secretary of War, it was said that, of the four dams remaining, dam No. 50, 1 mile below Weston, Ky., and dam No. 52, 1 $\frac{3}{10}$ miles below Brookport, Ill., were practically completed and dam No. 51, $\frac{9}{10}$ mile below Golconda, Ill., and dam No. 53, 10 $\frac{8}{10}$ miles below Joppa, Ill., would be completed by Nov. 1, 1929. Only unusually high water in 1928 and 1929 could delay this programme and a favorable season in 1928 would advance it, it was stated.

CONOWINGO DAM. At the end of 1927 the construction of the Conowingo Dam referred to in the 1926 YEAR BOOK had been completed and the power house built, except for the final closure of the spillway notches and this was in progress. This project involved a dam and power house 480 feet in length near the mouth of the Susquehanna River which was being built by the Susquehanna Power Company, a subsidiary of the Philadelphia Electric Company. Seven 54,000 horse-power units had been contracted for, to be installed in the power house to develop a total of 378,000 horse power, and provision was made for four similar units. The work had reached the point where it was expected that the first units would be brought into service in 1928, and during the year the water wheels and generators were being installed. The excavation of the tailrace, the clearing of the reservoir, and the construction of the highway bridge on the dam, had been completed during the year.

SKAGIT RIVER PROJECT. The city of Seattle, Wash., in September awarded a contract for the construction of the Diablo Dam in the Skagit project which was one of the units in the hydro-electric development which the city of Seattle was developing about 100 miles to the northeast. The contract price for the dam was \$2,263,000 and the dam itself was to be of the constant angle arch type, 400 feet in height, forming a 90,000 acre-foot reservoir that would store water for the Gorge Power House 6 miles below. The length of the arch proper was to be 775 feet and the total length including spillways and tangents was to be 1,100 feet. Later, a power house was to be built at the Diablo Dam. The dam site was connected by railway with the Great Northern Railway, the branch line being 32 miles in length. The con-

tract awarded called for the completion of the Diablo Dam in September, 1927.

SALUDA DAM. For the hydro-electric power development on the Saluda River near Columbia, S. C., the Lexington Water Company, a subsidiary of the General Gas and Electric Corporation, had under construction an earth filled dam approximately 8000 feet in length and 208 feet in height. A contract for this work was let in August and the estimated cost of the entire project was \$21,000,000.

Among the numerous dams of importance on which work was in progress during the year, or which had reached completion, a few may be mentioned in various parts of the United States. Preliminary construction was under way on the Coolidge Dam, a "multiple-dome" structure across the Gila River for irrigation in Arizona, while the Lake Pleasant Dam, on the Agua Fria River, was completed. This is a combined irrigation and power project and involved a multiple arch structure 2145 feet in length. Another dam in Arizona was the Horse Mesa, across the Salt River, a structure 306 feet in height above the lowest point in the foundation, also a combined irrigation and power dam.

The Southern California Edison Co. had completed in September, at Shaver Lake, a concrete gravity section dam 2222 feet in length along the crest, and 195 feet high. This was one of the elements in the Big Creek project of this company which was designed to increase materially its capacity. In New York State across Caneadea Creek, Caneadea, N. Y., a concrete arch dam was nearing completion for the Rochester Gas and Electric Co. Here the structure was to be faced with brick and architectural treatment gave it an attractive appearance.

HUME DAM. During the year considerable progress was made on the Hume Dam to impound the waters of the Murray River in Australia, the completion of which was expected in 1930. This dam, which in size was second only to the Elephant Butte Dam in the United States, involved also the construction of a hydro-electric plant which would make electric power available to a region within about 150 miles of the reservoir formed by the dam. There was also under construction in Queensland the Nathan Dam over the Dawson River Valley, and tentative plans were under development. The reservoir thus formed was expected to eclipse the Hume Reservoir in size by 284,000 acre-feet.

The Norman Gold Medal of the American Society of Civil Engineers was awarded to B. S. Jakobsen for a paper "Stresses in Thick Arches of Dams." Mr. Jakobsen had been active in the design and construction of dams for the United States Reclamation Service and for various hydro-electric power developments in the West, and also for the Los Angeles County Flood Control District. During the year a new edition of Edward Wegmann's *The Design and Construction of Dams* was published including a section of nearly 100 pages on "Multiple-Arch Dams" by Fred Moetzli. The work also includes the description of a number of recent dams not mentioned in earlier editions.

DANA, WILLIAM PARSONS WINCHESTER. American artist, died at London, Eng., April 8. He was born in Boston, Mass., Feb. 13, 1833,

and after attending the Boston Latin School studied art at the École des Beaux Arts, Paris, and under Picot and Le Poitevin. He lived in New York from 1862 to 1870, maintaining a studio in that city, and in the latter year took up his permanent residence abroad. He received a gold medal at the Paris Exposition in 1878 and the first prize for figure painting at the Pennsylvania Academy of Fine Arts in 1881. He was elected to the National Academy of Design in 1867. He was well known for his pictures of the sea in all its phases, and also for his genre pictures. Notable examples of his work are: "Solitude"; "Gathering Seaweed"; "Emby's Admiral" (Pennsylvania Academy of Design, Philadelphia); "Burning Wreck"; "Ebbtide at Yport"; "Chase of the Frigate Constitution"; and "Heartsease" (Metropolitan Museum, New York).

DANISH LITERATURE. See SCANDINAVIAN LITERATURE.

DANZIG. A free city, which, with its surrounding territory, was established by the Treaty of Versailles in 1919. It was formerly a part of the German Empire. Area, about 754 square miles; population, Aug. 31, 1924, 384,000. The administrative district of the city of Danzig had a population of 207,100. The city is the chief outlet for the commerce of Poland and continues to maintain its century-old position of being the leading grain port of the Baltic. Shipping is the chief industry, manufacturing being engaged in largely for local consumption.

In 1925, 3986 vessels of 1,869,979 tons entered and 3958 vessels of 1,846,182 tons cleared from the port. The budget for the fiscal year Apr. 1, 1926, to Mar. 31, 1927, as passed by the Danzig Volkstag on May 5, 1926, balanced at 117,857,180 gulden, and shows an increase of 4,147,450 gulden over the 1925-26 budget of 113,709,730 gulden, which was exceeded by actual disbursements. (1 gulden equals \$0.193.) The government of the free city is in the hands of a High Commissioner appointed by the League of Nations. Its constitution approved by the League May 11, 1922, provides for a legislative assembly of 120 members elected for four years, a senate consisting of 20 members, and a president and vice president. The senate is the highest authority in the state and holds secret sessions. High Commissioner at the beginning of 1927, Dr. Van Hamel (appointed Feb. 22, 1926).

DARTMOUTH COLLEGE. A non-sectarian institution of higher education at Hanover, N. H., founded in 1769. The 1927 fall session had an enrollment of 2258 students, most of whom were working for the regular college degree, the exceptions being: Nine graduate students; 37 in the Medical School; 17 in the Thayer School; and 91 in the Tuck School. There were 246 members on the faculty. The productive funds amounted to \$9,000,000. The library contained 235,000 volumes. During the year there were under construction the Fisher Ames Baker Memorial Library, the gift of George F. Baker of New York, estimated to cost \$1,000,000, a laboratory for the natural sciences, and a new dormitory. Construction of an enclosed hockey rink was also authorized. Admission to Dartmouth College is effected under a selective process, with due weight given to scholarship, character, qualities of leadership, and apparent ability to profit by a college education. A re-

vised curriculum was in force in 1927 providing among other things for special treatment for students of high grade and for the granting of but one degree, Bachelor of Arts, President, Ernest Martin Hopkins, A.M., Litt.D., LL.D.

DATE SCALE. See HORTICULTURE.

DAVIES, HYVEL. American mining engineer, died at Washington, D. C., February 19. He was born in Brecknockshire, Wales, Sept. 26, 1859, and was educated in local schools, serving as a teacher and bookkeeper, 1875-85, when he went to the United States. He was naturalized as an American citizen in 1892. He was in charge of the mining office of the East Tennessee Coal Company until 1890, when he was appointed general manager of the du Pont mining operations, serving until 1912. He was a consulting and mining engineer of coal companies in the Southern States and Mexico, being president of the Western Kentucky Coal Operators' Association, 1910-12, and president of the Kentucky State Coal Operators' Association, 1911-13. In 1914 he became government mediator in the Colorado coal strike, and in the following year acted in the same capacity in the eastern Ohio coal strike. He mediated in the Alaska government railroad strike of 1916, and continued as commissioner of conciliation in the United States Department of Labor. During the World War he was government labor administrator for the copper industry, and he was sole referee of the California oil industry, 1919-21. In 1922 he was a member of the United States government commission on labor condition in the Hawaiian Islands. From 1908 to 1914 he was a trustee of the Kentucky State University. He wrote many papers on mining and industrial relations.

DÁVILA, dá've-lá, MIGUEL R. Former President of Honduras, died at Tegucigalpa, Honduras, October 14. He came into prominence as president of the Honduran provisional government which was organized in April, 1907, at the time of the civil war which involved the resignation of President Bonilla. The latter surrendered at Amalpa, Apr. 11, 1907. General Dávila did not actually become president of Honduras until Gen. T. Sierra, who had proclaimed himself president, was defeated in the following month. Dávila was reelected president in February, 1908, and instituted a number of reforms in government. In 1908 President Dávila became involved in difficulty with the United States government, and the Republic of Honduras was forced to tender an apology for an act considered insulting by the American consular agent at San Pedro. In that year President Dávila lost his power through various revolutionary movements, the presidency being transferred provisionally to Dr. Francisco Bertrand. From that time on Dávila did not figure prominently in the affairs of Honduras.

DAWES PLAN. The operations of the Dawes Plan for reparations took on a more significant aspect in 1927 than in any previous year in light of the fact that S. Parker Gilbert, the Agent General, took occasion to criticize severely German financial policies. In a note presented to the German government on October 20, Mr. Gilbert stated that he was criticizing the government in a friendly manner and for its own good; that he firmly believed Germany was doing her best to meet all her obligations under the agreement, and that he assumed that she

was attempting to raise the standard of living of her people through her industrial and commercial development. He felt that Germany had a special incentive to save and economize, but was "developing and executing constantly enlarging programmes of expenditures and borrowings," which jeopardized the Dawes plan and attacked the vitality of the entire economic structure of the country.

Specifically he called attention to the unbalancing of the budget with items of expense which could readily have been postponed to a future time, such as pensions, increases in salaries, compensation for property confiscated during the war, and unsound educational developments. He further attacked the grants made to the federated states by the central government and the undue expansion of credit on the part of the Reichsbank. In concluding he stated that if these financial tendencies continued, economic disaster for Germany would follow, as well as the general impression in foreign countries that Germany regarded her reparation obligations lightly.

The German government replied to Mr. Gilbert's note without any show of anger and attempted to prove to him that his charges were unfounded, and that the increase in borrowing was only in consonance with the increasing industrial activity of the country. Salaries were raised and pensions allowed or increased "for political reasons," nationals were indemnified in accordance with the Treaty of Versailles, and education expenditures would not effect the country for some time to come. The German government admitted that the financial relations between the central government and the various states were not what they might be, but every effort was being made to alter the situation. The note concluded by stating that the government would continue to do everything in its power to maintain a balanced budget and live up to its international obligations. Nearly all shades of German opinion were shocked by the contents of Mr. Gilbert's note. Some attacked it on the grounds of infringing German sovereignty and others declared that it was un-American and written at the behest of the German government itself.

In his annual report covering the third year of the operation of the Dawes Plan, Mr. Gilbert said in connection with the German government's reply to his note of October 20: "Looking toward the future, these declarations of the German government furnish a basis for proceeding with the test of practical experience as intended by the plan, and it is encouraging that the government already has taken some measures for financial reform. The real answer depends on the practical results that follow and on the extent to which Germany succeeds in reversing the tendencies toward overspending and overborrowing that have so generally appeared. Fortunately, this test is a relatively simple one to apply, and it will soon be apparent from the course of public expenditure and borrowing whether or not real reforms have been accomplished."

In concluding his report the Agent General expressed the opinion that ultimately Germany must be left free to pay her war debts of her own accord, without being subjected to the sort of control which he himself is now exercising. "As time goes on and practical experience accumu-

lates, it becomes always clear that neither the reparation problem nor the other problems depending upon it will be finally solved until Germany has been given a definite task to perform on her own responsibility, without foreign supervision and without transfer protection. This, I believe, is the principal lesson to be drawn from the past three years, and it should be constantly in the minds of all concerned as the execution of the plan continues to unfold."

The third year's annuity of 1,500,000,000 marks was punctually paid and the report stated that it was confidently expected that the fourth year's payment of 1,750,000,000 marks would be met just as punctually. Of the 1,500,000,000 marks paid, 410,000,000 were paid from the national budget. For the fourth year, 500,000,000 marks must be raised from this source. Transport taxes, industrial debentures and German railway bonds also will be obliged to bear a heavier burden. France received the greatest share of reparations, totaling 787,000,000 marks, with more than 50 per cent of the payments in kind. Great Britain received 307,000,000 marks; Italy, 108,000,000; Belgium, 97,000,000; the United States, 55,000,000; Jugo-Slavia, 54,000,000; Rumania, 12,500,000; Japan 13,000,000; Portugal, 8,000,000; Greece, 4,000,000; and Poland, 304,000. The third year showed a considerable increase in foreign currency payments in cash or goods, totaling 40 per cent, compared with 35 per cent during the previous year. There was a corresponding decrease in payments in kind. Of deliveries in kind, coal held first place, totaling 200,000,000 marks. Payments in kind included contracts awarded to Germany for dredging work at Havre and bridge construction over the Danube at Belgrade.

The report covered 237 pages and was supplemented by three additional bulky reports from the Commissioners for German railroads and the Reichsbank and the Trustee for Industrial Debentures. It made a thorough investigation of finance, currency, trade, cost of living, employment, and railways. It gave a solemn warning to all bond holders of the German government that the reparation payments represented a first lien on the resources of the country and took precedence over government obligations abroad. The report also hinted at a downward revision of the payments, which was bitterly attacked in the French press. To the French, reparations and the payment of interallied debts are inseparable, and, consequently, they maintain that a reduction in reparations puts off for a longer time the settlement of the Franco-American debt controversy. The American government, on the other hand had repeated time and again that the two problems had absolutely no relation with one another.

DEATH RATE. See VITAL STATISTICS.

DEFECTIVES. See CHILD WELFARE.

DELAWARE. POPULATION. According to the 14th Census, the population of the State on Jan. 1, 1920, was 223,003. The estimated population on July 1, 1927, was 243,000. The capital is Dover.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927.

Crop	Year	Acreage	Prod. bu.	Value
Corn	1927	185,000	4,725,000	\$3,780,000
	1926	188,000	4,278,000	2,788,000

Crop	Year	Acres	Prod. bu.	Value
Wheat, winter	1927	98,000	1,862,000	2,328,000
	1926	108,000	2,060,000	2,678,000
Hay	1927	83,000	147,000*	2,378,000
	1926	80,000	118,000*	2,156,000
Potatoes	1927	6,000	714,000	571,000
	1926	6,000	516,000	722,000
Sweet potatoes	1927	8,000	880,000	616,000
	1926	9,000	1,251,000	818,000

* tons.

MINERAL PRODUCTION. The total mineral product of the State, \$539,261 in 1925 as against \$512,105 in 1924, consisted chiefly of clay products (1925, \$271,701; 1924, \$235,555) and stone (1925, \$219,054; 1924, \$243,279).

FINANCE. As reported by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State government in the fiscal year ending June 30, 1926, were \$4,371,251; their rate per capita was \$18.29. They included \$1,361,416 apportioned for education. Totals not included above, of \$399,553 for interest payments and of \$2,670,467 for permanent improvement outlays, brought the aggregate of State expenditure to \$7,441,271. Of this, \$2,216,871 was for highways; \$203,612 being for maintenance, and \$2,013,259 for construction.

Revenue receipts were \$7,880,570; or per capita, \$32.97. Of their total, property and special taxes yielded 61.9 per cent, attaining the per capita rate of \$20.41. Earnings of the departments and compensation paid the State for officials' services supplied 4.5 per cent of revenue; 18.8 per cent was derived from sale of licenses, chiefly on incorporated companies and motor vehicles, and from a tax on gasoline sales.

Net State indebtedness on June 30, 1926, was \$8,205,640, or \$34.33 per capita. Property subject to ad valorem taxation had a total valuation of \$252,041,739. State taxes levied were \$630,104, or \$2.64 per capita.

TRANSPORTATION. The total number of miles of railroad line in the State on Jan. 1, 1927, was 331.79. No additional line or trackage was reported to have been constructed in 1927.

EDUCATION. By enactment \$2,000,000 was appropriated from the funds of the State to be distributed as aid in the construction of modern school buildings, the intention being to promote a state-wide building programme.

CHARITIES AND CORRECTIONS. The activities of the State were under two bodies, a State Health and Welfare Commission and a State Board of Charities. Among the institutions of the State were a system of industrial schools for whites and for the colored.

LEGISLATION. The State legislature at its regular biennial session enacted a law making 14 amendments in the State corporation act. The amendments were prepared by the State Bar Association, and were intended to render the statute more liberal, with the purpose of preserving the tendency of companies outside the State to seek Delaware charters. Among the amendments the most important provided: Authority to fix quorums of boards of directors at not less than one-third of the membership of the board; permission to remaining directors, though less than a quorum, to fill by majority vote vacancies in a board; permission to pay dividends out of net profits or out of net assets in excess of capital; reduction of incorporation fees to 1 cent on each \$100 par value of stock

and one-half cent on each share of no par value, with lower rates for shares in excess of 20,000; removal of limitations as to kinds or degrees of preference in stock issues. The Legislature also passed an appropriation bill of \$3,407,774 for expenses of the State government in the two years to ensue. It created a commission of five to confer with a like body from New Jersey upon the disputed boundary between the two States, along the course of the Delaware River. The divorce law was amended to provide the private hearing of cases. A bill appropriating surplus cash of the State at the rate of \$1,000,000 a year for two years, for allocation among school districts for the purpose of assisting these in constructing school buildings, was enacted. A State school tax board of appeals was created, and an appropriation of \$2,500,000 a year was made toward the expense of running the schools of the State. The Legislature adjourned April 9.

POLITICAL AND OTHER EVENTS. In pursuance of a new law, the courts of the State began in May the practice of hearing divorce actions in private, and news of the court proceedings in these cases was confined to the names of the parties divorced and of the causes for which decree was granted. The deepening and widening of the Chesapeake and Delaware Canal by the Federal Government was completed and the enlarged canal was formally opened, to form an integral part of the 1500 mile coastal inside waterway system. Exercises were held at Reedy Point, May 14. The Market Street Bridge over the Christiana River at Wilmington, a steel decked bascule costing over \$500,000, was completed, and was dedicated November 11. Meetings were held to promote the proposed construction of a bridge across the Delaware River to connect Wilmington with New Jersey directly. Members of the Del-Mar-Va Eastern Shore Association voted in October to continue the life of that tri-State regional improvement body after the close of 1927.

OFFICERS. Governor, R. P. Robinson; Lieutenant Governor, J. H. Anderson; Secretary of State, Charles H. Grantland; Treasurer, Howard M. Ward; Auditor, Edward Baker; Attorney General, C. A. Southerland; Commissioner of Insurance, James G. Shaw; State Bank Commissioner, Harold W. Horsey.

JUDICIARY. Chancellor, Josiah O. Wolcott; Chief Justice, James Pennewill; Associate Judges, Richard S. Rodney (at large), Herbert L. Rice, William Watson Harrington, Charles S. Richards. See **WOMEN IN INDUSTRY**.

DELINQUENCY. See **CHILD WELFARE**.

DE MOLAY, ORDER OF. A non-sectarian secret organization for young men between the ages of 16 and 21; founded in March, 1919, by Frank S. Land, at Kansas City, Mo., and named in honor of Jacques De Molay, the last military Grand Master of the Knights Templar. The members are pledged to the precepts of love of parents, reverence, patriotism, cleanness, courtesy, comradeship, fidelity, and to the promotion of the public school system. Certain obligatory days are observed. Conclaves are held in each state annually. The Order is governed by a Grand Council of Freemasons, while the chapters are sponsored by Masonic bodies. In November, 1927, there were 1652 chapters, 250,000 members, and more than 100,000 De Molays who had outgrown active membership. In August,

1927, the International De Molay Alumni was organized, and in November, 1927, numbered 45 chapters and about 10,000 members who were former De Molays. The headquarters of the Order are in its own building, The Shrine of Youth, at 210 Armour Boulevard, Kansas City, Mo. Frank S. Land, the founder, was Grand Scribe of the Order.

DEMONSTRATION WORK. See AGRICULTURAL EXTENSION.

DENISON UNIVERSITY. A coeducational Baptist institution of higher education at Granville, Ohio; founded in 1831. The enrollment for the autumn of 1927 was 908. The faculty numbered 70. The net income for the year was \$142,874. The library contained 60,000 volumes. The inauguration of Avery Albert Shaw, A.M., D.D., as president of the University, occurred on Oct. 21, 1927, and was attended by 96 official representatives from the various colleges and universities of the United States. The subject of Dr. Shaw's inaugural address was "A Christian College of Liberal Arts." Definite plans were made by the board of trustees for the erection of a new library, an administration building and a hospital.

DENMARK. The smallest of the three Scandinavian states; comprising the peninsula of Jutland with its adjacent islands in the Baltic, the Faroe Islands, a part of Schleswig as a result of the plebiscite of 1920 under the terms of the Treaty of Versailles, and Greenland (q.v.), the only colony or possession. Iceland is a free sovereign state, but united to Denmark in the person of the King of Denmark who is also head of the government of Iceland (q.v.). Capital, Copenhagen.

AREA AND POPULATION. The area is 16,568 square miles, including the Faroe Islands, which have an area of 540 square miles; population, according to the census of Nov. 5, 1925, 3,434,555. North Schleswig, which voted in the plebiscite of 1920 to form a part of Denmark, had an area of 1502 square miles and a population in 1925 of 176,433. The islands in the Baltic had an area of 5133 square miles and a population of 1,575,533 in 1925. Of the population more than 95 per cent were born in Denmark. The movement of population in 1925 was: Births, 71,897; deaths, 37,083; marriages, 25,786; emigrants (chiefly to the United States and Canada), 4578. The population of Copenhagen in 1925 was 587,150; with suburbs, 731,496. Other large cities with their 1925 populations are Aarhus, 76,226; Odense, 52,376; Aalborg, 42,812; Horsens, 28,135; and Randers, 26,856.

EDUCATION. Elementary education is free and compulsory between the ages of 7 and 14. In 1925 there were 4491 lower schools; of these 34 were maintained by the government, 3847 by the local communities, and 610 were private institutions. The number of pupils in the 4491 schools was 495,952. For higher education there is the University of Copenhagen with about 120 professors and teachers and 4000 students. There are also many popular high schools, agricultural schools, training schools for teachers, and other technical and special institutions.

PRODUCTION. Of the total area of Denmark, 80 per cent is productive; about one-sixth of the unproductive area is peat bogs. Of the productive area 6 per cent is forest, and of the remainder less than one half is arable, and the remainder pasture and meadows. The accompany-

ing table from the *Statesman's Year Book* for 1927 shows the acreage and production of the principal crops in 1925:

Crops	Area	Production
	1925 Acres	1925 Tons
Wheat	197,806	265,290
Rye	580,087	849,155
Barley	744,469	796,320
Oats	1,099,528	955,629
Mixed grain	560,466	507,668
Potatoes	186,091	1,810,900

On July 15, 1926, there were in Denmark 548,448 horses, 2,839,531 head of cattle, 235,000 sheep, 3,034,000 swine, and 17,700,000 hens.

COMMERCE. According to the U. S. Bureau of Foreign and Domestic Commerce, Denmark's foreign trade in 1926 showed a considerable decrease as compared with the preceding year. Imports dropped from 2,082,000,000 crowns to 1,621,000,000, and exports (including reexports) from 1,950,278,000 crowns to 1,514,580,000 crowns. This marked decrease was more apparent than real, however, being largely due to the appreciation of the crown. The accompanying depression in industry, which in turn lessened the demand for many products of foreign origin, also contributed to reducing imports. Denmark's leading imports also decreased in quantity during 1926 as compared with 1925. This was especially true of agricultural raw materials.

DENMARK'S LEADING EXPORTS DURING 1925 AND 1926

Commodity	1925	1926
Live cattle	number. 81,000	156,000
Hogs	do. 18,000	18,000
Bacon	metric tons 191,500	190,200
Pork, fresh	do. 2,000	2,600
Beef, and veal, fresh	do. 26,000	16,000
Casings	do. 7,500	8,500
Cheese	do. 8,500	7,000
Butter	do. 122,000	131,000
Eggs	do. 2,000	408,000
Grain, unground	metric tons 62,000	104,000
Portland cement	do. 266,000	381,000

DENMARK'S LEADING IMPORTS DURING 1925 AND 1926 [In metric tons]

Commodity	1925	1926
Coal and briquettes	3,336,000	3,104,000
Coke and cinders	683,000	826,000
Fuel oils	276,000	841,000
Oil cakes and oil-cake flour	794,100	712,100
Oorn	456,600	885,300

Great Britain and Germany have long been Denmark's best foreign markets for agricultural produce. As in 1925, all of the live cattle exported during 1926 were shipped to Germany. Of the fresh beef and veal exported, Germany took 14,000 metric tons as against 24,000 tons in 1925, whereas Great Britain took only 1500 and 1800 metric tons, respectively. The crown value of agricultural products exported from Denmark during 1926 was, however, much lower than in 1925, the totals being 1,038,000,000 and 1,344,080,000 crowns respectively. The rise in the value of the crown and the unsatisfactory prices in the English market were responsible for this

decline. Most of Denmark's imports are supplied by Germany, the United States, and Great Britain in the order named. Germany's share of Denmark's 1926 trade, on the percentage basis, increased over 1925 about as much as that of Great Britain fell off, while that of the United States showed practically no change. Great Britain was by far Denmark's leading export market during these years; Germany was second, and the United States was of minor importance. The drop of England's share in Denmark's total imports from 14.7 per cent in 1925 to 11.4 per cent in 1926 was attributable largely to the English coal strike, which made it necessary for Denmark to purchase her coal in other markets.

FINANCE. The Danish post-war budgets of recent years have shown a deficit, although a diminishing one, following decreased earnings in business and industry and relatively large expenditures necessitated by such extraordinary demands as unemployment doles and State intervention in banking reconstruction and exchange stabilization. New domestic sources of revenue have been found, however, in the restaurant tax, the automobile tax, and the luxury import duties, and in the development of north Schleswig; also foreign sources have been drawn upon for new loans. The accompanying table from the *Statesman's Year Book* for 1927 is an abstract of the budget estimates for the fiscal year 1927-28:

<i>Current revenue</i>		<i>Kroner</i>
Debit balance of domain revenues	1,407,448	
Debit balance of State undertakings	14,378,876	
Interest (net)	9,348,648	
Balance of funds, etc.	638,184	
Direct and indirect taxes	341,928,269	
Balance of lotteries	2,537,256	
Separate revenues	2,919,965	
Total current revenue	341,580,993	
<i>Current expenditure</i>		<i>Kroner</i>
Civil list and appanages	1,072,000	
Rigsdag	2,280,000	
Council of State	483,773	
Ministry of Foreign Affairs	5,425,411	
Ministry of Ecclesiastical Affairs	3,743,011	
Ministry of Public Instruction	64,728,685	
Ministry of Justice	17,886,367	
Ministry of Interior	77,817,311	
Ministry of Labor	56,566,004	
Ministry of Agriculture	12,380,319	
Ministry of War	29,599,392	
Ministry of Marine	18,810,268	
Ministry of Finance	28,865,387	
Ministry of Public Works	7,700,701	
Ministry of Industry, Commerce and Navigation	4,884,085	
Greenland	18,483,098	
Pensions	18,483,098	
Total current expenditure	340,225,712	

COMMUNICATIONS. The 1926-27 statement of the Danish State Railways revealed a deficit of 22,400,000 crowns as compared with 29,200,000 crowns in the previous year. The somewhat better financial result during 1926-27 was attributable to a reduction in operating expenses (approximately 16,200,000 crowns), in that operating revenues—of which only the postal service had shown an increase—decreased by approximately 9,300,000 crowns as compared with the preceding year. The marked decrease in operating expenses was owing chiefly to the reduction in wages and fuel for the locomotives, ferries, and ships operated by the State Railways. The cause for the sharp drop in operating expenditure was found in the reduction of 4,500,000 crowns in passenger traffic, which again was

attributable to the general depression prevailing in Denmark, as well as to competition from other forms of traffic. General freight and cattle shipments showed a decrease of 4,500,000 crowns which was partly because of competition from other forms of traffic and partly for other causes, such as hoof-and-mouth disease.

In spite of the British coal strike, fuel prices were considerably lower than in the preceding late years. The purchase price of coal averaged 23 crowns per ton as compared with 26 crowns the preceding year. The ever-increasing number of privately owned motor cars, more than the increase in motor-bus traffic, was responsible for the heavy decline in passenger traffic. The total railway mileage of the country was approximately 3148 miles, of which 1505 belonged to the State. In 1925, 29,429 vessels of 9,636,000 tons cargo entered the Danish ports from foreign countries, and 30,049 vessels of 9,600,000 tons cleared.

GOVERNMENT. Executive power is vested in the king who acts through a responsible ministry, but who has no power to declare war or make peace without the consent of the Rigsdag, or parliament, and the legislative power is vested in the Rigsdag, which is composed of the Folketing (lower house) and the Landsting (upper house). The Folketing has 149 members, of whom 117 are elected on the basis of proportional representation and the remainder divided among the parties not having obtained sufficient returns at the district elections; the Landsting has 75 members, elected indirectly by the voters for the lower house. King in 1927, Christian X (born Sept. 26, 1870), who succeeded his father, Frederik VIII on May 14, 1912. The ministry as appointed Dec. 14, 1926, was as follows: President of the Council and Minister of Agriculture, Th. Madsen Mygdal; Foreign Affairs, L. J. Moltesen; Interior, O. C. Kragh; Health, V. Rubov; Justice, S. Rytter; Defense, S. Brorssen; Public Instruction, J. Byskov; Ecclesiastical Affairs, F. Brunn-Rasmussen; Public Works, J. P. Stensballe; Finance, N. Neergaard; Industry, Commerce and Navigation, M. Slebsager.

HISTORY. During the summer the upper house of the legislature definitely rejected the disarmament proposal which had been before the country for some time. It was originally passed by the lower house in March, 1926, and provided for the abolition of the army and the establishment of a sort of militia, the razing of the fortifications, the repeal of general conscription, and the limiting of the navy to merely guarding the home waters. The government which introduced the measure originally went out of power at the end of 1926. (See preceding YEAR BOOK.) Some mention was also made during the year of the Schleswig question, the discussion being based on the allegations that Germany was using propaganda to regain political control of the territory she lost through the plebiscite. The government took no official action on the complaints. A similar situation is found in the districts of Eupen and Malmédy in Belgium.

DENNING, JOSEPH M. Former United States Consul General at Tangier, Morocco, and a Roman Catholic priest, died at Cincinnati, Ohio, July 26. He was born at Cincinnati, Apr. 19, 1866, and after graduating from St. Xavier's College in that city in 1887 received the degree of A.M. in 1890. He was ordained priest in

1891, after studying at the Seminary of St. Mary of the West. He held pastorates in Cincinnati, Oxford, Hillsboro, and Marion, Ohio, from which place he was appointed by President Harding diplomatic agent and consul general at Tangier, Feb. 10, 1922. He was the first Roman Catholic priest to hold a consular or diplomatic post of the United States, receiving for the purpose an indefinite leave of absence from Archbishop Henry Moeller of Ohio. For two years he had an interesting experience in the diplomatic service at a time when the great powers of Europe—France, Spain and Great Britain—were in rivalry in Morocco; and while he was successful, largely through his shrewdness and good humor, he did not find diplomatic life entirely congenial, and retired from the service May 1, 1924.

DENVER, UNIVERSITY OF. An institution of higher education at University Park, Denver, Colorado; founded in 1864. The registration for the autumn term of 1927-28 totaled 3169, distributed as follows: College of Liberal Arts, 1197; School of Dentistry, 124; School of Law, 77; City College, 641; School of Commerce, 756; School of Pharmacy, 26; School of Engineering, 141; Summer Session 1927, 838. The faculty had 168 members. The library contained more than 50,000 volumes. Chancellor, Wilber Dwight Engle, Ph.D., Sc.D., LL.D.

DE PAUW UNIVERSITY. A coeducational institution of higher education at Greencastle, Indiana, under the auspices of the Methodist Episcopal Church; founded in 1837. For the autumn session of 1927 the enrollment was 1616, including 894 men and 722 women. Of this number 1434 were registered in the College of Liberal Arts and 182 in the School of Music. In the summer session of 1927 there were 210 students. The College of Liberal Arts had a faculty of 90 and the School of Music, 16. During the year 16 new faculty members were appointed as follows: a dean of the college; a secretary of the faculty; a registrar; a professor of psychology; a professor of sociology; an associate professor of economics; an assistant professor of economics; and nine instructors. The productive funds of the university were \$4,746,103; the income from endowment was \$153,152, and the total income for the year was \$480,120.89. Longden Hall, a dormitory for men, was completed and occupied at the beginning of the semester. Lucy Rowland Hall, a dormitory for women, was also constructed. A new heating plant was installed. Additional funds totaling more than \$650,000 were received for the endowment of the Rector Scholarship Foundation. The library contained 62,809 volumes. President, Lemuel Herbert Murlin, LL.D.

DERBY. See RACING.

DESTROYERS. See VESSELS, NAVAL; NAVAL PROGRESS.

DETROIT, UNIVERSITY OF. An institution of higher education at Detroit, Mich., under the auspices of the Roman Catholic Church and conducted by the Jesuit Fathers; founded in 1877. In the autumn of 1927 there were 2494 students registered for the college courses, distributed as follows: arts and science, 672; engineering, 813; commerce and finance, 904; law, 205. In addition, there were 365 students enrolled for the high school courses. In the summer session 142 students were enrolled. The faculty numbered 196. The productive funds in

1927 totaled \$594,159.84. There were 46,000 volumes in the library. The following new buildings were completed during the year: faculty residence, power house, engineering building, commerce and finance, chemistry, and science buildings, and Soldiers' Tower. President, the Rev. John P. McNichols, S.J., Ph.D., LL.D.

DETROIT INSTITUTE OF FINE ARTS. See ART MUSEUMS.

DIABETES. Now that this disease has been partially conquered through the ability to regulate blood sugar production by diet, and more recently by the discovery of insulin, one expects to see more attention bestowed on individual aspects of the malady. In the *Journal of the American Medical Association* for Aug. 27, 1927, Dr. Leman of New Orleans presents the subject of diabetic gangrene, a complication which had not been considered as of unusual importance. Dr. Joslin, an extensive writer on diabetes, found only an incidence of 3 per cent in a material of 2000 cases and added that of this number 90 per cent might have been prevented by good foot hygiene, including daily bathing. It follows that in the older and poorer strata of population there should be a higher incidence, and in certain public institutions such as the Boston City Hospital, the percentage had reached 11 or more. In New Orleans for some unknown reason some clinics showed as high as 14 per cent among whites, 18 per cent among all patients and 21 per cent among the negroes alone. In discussing this paper Dr. Allen pointed out that diabetes caused gangrene only indirectly—that is by setting up hardening of the arteries of the lower extremities—and that the incidence must vary with the amount of arteriosclerosis as well as with the presence or absence of good foot hygiene. If we regard this complication merely as determined by the arteries diabetic gangrene is only a precocious senile gangrene.

DIAMONDS. In 1927 the United States imported rough or uncut diamonds to the amount of 237,095 carats valued at \$114,700,226, as compared with 236,953 carats valued at \$113,070,767, in 1926. Diamonds cut but not set, to the amount of 445,571 carats, valued at \$40,736,351, were imported, as compared with 555,363 carats valued at \$51,361,942 in 1926. As usual the Netherlands and Belgium were the principal sources of supply, the 1927 imports from these two countries being 22,849 carats valued at \$21,316,729 and 197,024 carats, valued at \$15,972,533 respectively.

The Union of South Africa continued to be the most important producer of diamonds and it was stated that the production and sales of January to August, 1927, inclusive, amounted to 2,808,165 carats of a value of £8,561,014. The Lichtenburg Fields of the Western Transvaal experienced considerable expansion during the year and their activity was such as to occasion fear of the future stability of the diamond market and doubt whether the production could be absorbed by the purchasing syndicates which had controlled the market. Early in the year what was stated to be the greatest rush ever witnessed in South Africa occurred after the proclamation of the farm Grasfontein, and a further proclamation of the farm Welverdiend also attracted a number of miners. A striking discovery of diamonds was reached at Alexander Bay to the South of the mouth of the Orange River and a parcel of about 12,000 carats.

amounting in value to approximately £150,000, was recovered in a few weeks. See CHEMISTRY, INDUSTRIAL.

DICKMAN, JOSEPH THEODORE. Major General, United States Army, died at Washington, D. C., October 23. He was born at Dayton, Ohio, Oct. 6, 1857, and graduated from the United States Military Academy in 1881, being commissioned second lieutenant in the Third Cavalry. He was an honor graduate of the Infantry and Cavalry School in 1883 and served in the cavalry through successive grades until 1917, when he was made brigadier general. As a first lieutenant in the Third Cavalry he was one of a band engaged in the pursuit of the Apaches led by Geronimo, and he served for several years along the Rio Grande. At the outbreak of the Spanish-American War he was assistant instructor at the Infantry and Cavalry School. During the war and the Philippine Insurrection he saw extended service and received rapid promotion, becoming chief of staff for General Adna R. Chaffee, who commanded the American forces in the Boxer uprising in China in 1900. After further service as military instructor and on staff duty at Washington, he took command of the Second Cavalry at Fort Ethan Allen in Vermont, remaining there until the entry of the United States in the World War, when he was promoted to brigadier general in the regular army and major general in the national army. Going abroad with the American Expeditionary Forces, he participated in every major engagement of the American troops. Later, as commander of the Third American Army, he led the army of occupation into Coblenz, Germany, where he was in command until the spring of 1919. On his return to the United States he commanded the Eighth Corps Area, with headquarters at Fort Sam Houston, Texas, and retired on Oct. 5, 1921, after completing 45 years of service. He received the Distinguished Service Medal of the United States, the Croix de Guerre of France, and the Order of Leopold of Belgium. He also was made a Commander of the Legion of Honor in France and a Knight Commander of the Bath in England. He received the degree of LL.D. from the University of Vermont in 1916 and a similar degree from the University of Dayton, Ohio, in 1923. In addition to being active as a soldier he was a profound student of military science and wrote extensively. He was an authority on the American cavalry drill and service regulations, and translated Von der Goltz's *Conduct of War*. He served as military aide to Prince Henry of Prussia, brother of the former Kaiser, during the visit of the prince to the United States in 1902. Shortly before his death General Dickman published *The Great Crusade*, in which he advanced original opinions and criticisms as to the conduct of the War and asserted that many American lives were sacrificed at Belleau Wood by French generals.

DILLON, JOHN. Irish politician and agitator, died in London, England, August 4. He was born in Dublin in 1851, the son of John Blake Dillon, a member of the British Parliament for Tipperary. He was educated at the Catholic University of Dublin and studied medicine, becoming a member of the Royal College of Surgeons. He was one of the leaders of the "Young Ireland" movement. Following the guidance of Par-

nell in the Nationalist Party, Dillon entered political life and in 1880 was elected to Parliament from his father's constituency. In the House of Commons he immediately became a leading figure among such Irish members as Sexton, O'Brien and Biggar, and by many was considered second in importance to Parnell only, whose leadership he followed loyally. In 1881, after making a speech at Kildare to the Land League in which he advocated boycotting, he was arrested by the British government under the coercion act, and remained in prison for three months. He was again arrested in the same year. He continued as an important Irish leader, but in 1883 he was compelled to retire from Parliament on account of ill health. In 1885 he was elected for Mayo East, a constituency he represented for many years. He promoted the "plan of campaign" under which Irish tenants paid rent to the Land League instead of to their respective landlords, and this led again to his arrest, though he was released through a disagreement of the jury. In 1888 he was convicted under a new law and sentenced to six months' imprisonment, but before the expiration of the term he was released on account of ill health. He visited Australia and New Zealand, collecting funds for the Land League, and on his return to Ireland he was once more arrested, and released on bail. He went to America, forfeiting his bail, and after his return to Ireland by way of France was confined for a time in Galway jail with other Irish leaders. Dillon and William O'Brien became, after the Parnell-O'Shea scandal, leaders of the anti-Parnellite faction, and in February, 1896, after the expulsion of Timothy Healy and others, Dillon became chairman of the Irish National Federation, succeeding Justin McCarthy. He held this position until 1899. In 1896 he organized a world's convention of the Irish race, attended by some 2000 delegates. In the following year he opposed in Parliament the address to Queen Victoria on her diamond jubilee, on the ground that her reign had not been beneficial to Ireland. In 1901 he opposed a grant to Lord Roberts, charging him with "systematic inhumanity" in the Boer War. Mr. Dillon, who in 1900 had accepted the leadership of John Redmond over the reunited Irish party, continued his political activity until March, 1918, when he succeeded Redmond as head of the Irish Nationalist Party. His career in the House of Commons was marked by vigorous activity, and in 1902 he was suspended for epithets directed against the Colonial Secretary, Joseph Chamberlain. In that year he denounced the British government for reviving the crimes act, and he helped to forward the Wyndham land purchase act. In 1909 he was active in defending the cattle-driving policy, and later was opposed to the militant methods of the English and Irish "suffragettes." He criticized the British expenditures for naval maintenance in the year before the World War, but at the opening of that contest he favored Irish participation, although in Parliament he opposed compulsory service for Ireland on the ground that the Irish were a free people and should not be conscripted. In 1916, after the Dublin uprising, he accused the government of using military methods in suppressing the Sinn Feiners, and in 1918, as head of the Nationalist Party, he brought forward a resolution to the effect that the Irish policy of the government was not consistent

with the principles for which the Allies were fighting. At the general election of December, 1918, with other Nationalists who experienced the vengeance of the Sinn Feiners, he lost his seat in the House of Commons and from that time he passed from view as an active political leader, though he actively discussed the Home Rule question. In 1925 he declared that the Dail was bankrupt and that the former oppression of England was no worse than existing conditions. He criticized the Free State government and the maintenance of the Free State army, but failed to enlist any general support of his policy.

DILLON, JOHN FRANCOIS. United States Radio Commissioner, died at San Francisco, Calif., October 9. He was born at Bellevue, Ohio, Mar. 6, 1886, and, after engaging in various callings, in 1894 enlisted in the Signal Corps of the United States Army. He served various enlistments, and in 1904 became master electrician, and later was placed in charge of the electrical laboratory of the Signal Corps. In October, 1912, he became radio inspector in the Department of Commerce and Labor, and was placed in charge of the Eighth Radio District, with headquarters at Cleveland. In 1917, at the entrance of the United States into the World War, he was commissioned a captain in the Signal Corps, and he served in France until 1919, having been promoted to major during the period of hostilities. In April, 1919, he was discharged from active service, again becoming radio inspector, and in May, 1923, he was made supervisor of radio for the Sixth District, being later appointed radio commissioner for the Fifth Zone.

DIPHTHERIA. According to the *Weekly Bulletin of the City of New York Health Department* for Sept. 10, 1927, there was an increase in the incidence and mortality of diphtheria during the first half of the year. Despite the increase in population there had been a progressive decline of the incidence from 14,014 cases in the Greater City in 1919 to 7531 in 1926, while the deaths declined from 1239 to 477 during the same period. This decline was attributed largely to the campaign of the Department of Health, which included efforts at immunization with toxin-antitoxin, although it was admitted that the changes in the rate of incidence were governed in part by factors which are quite unknown. In the city of Berlin, for example, a similar increase was reported for the year.

The question of the greatest importance was the relation between the new cases and the immunizing effort. Of a series of 150 children who developed diphtheria in 1927 it was learned that only a few, amounting to 2 per cent of the whole, had received the immunizing injections, and that but one of these had been completely immunized by the three injections required. There was therefore every reason to go ahead with the toxin-antitoxin immunizing campaign.

DISCIPLES OF CHRIST. A communion known also as the Churches of Christ and sprung from a movement for Christian unity, which arose in American Presbyterian circles at the beginning of the 19th century, under Barton W. Stone in Kentucky and Thomas and Alexander Campbell in Western Pennsylvania. This is the

largest religious body having its origin in America. It was fifth among Protestant communions in the United States in 1927. In polity the churches are congregational. There were five major agencies of this communion in 1927: The United Christian Missionary Society; Board of Education; Board of Temperance and Social Welfare; Association for the Promotion of Christian Unity; and the missionary societies of the several states and of the provinces of Canada. These agencies are related in an advisory way to the International Convention of Disciples of Christ, which meets annually in May. The general missionary work of the churches is organized under the United Christian Missionary Society, with headquarters at 425 DeBaliviere Avenue, St. Louis, Missouri. Its board of managers of 120 is composed of an equal number of men and women. The foreign missionary work in 1927 embraced the Belgian Congo, Africa, China, India, Jamaica, Japan, Mexico, Philippine Islands, Porto Rico, Argentina, Paraguay, and Tibet (Batang, on the border). At the end of the year the Society had almost completed a thorough survey of the work throughout the world.

During 1927 there were 5230 baptisms in foreign fields, a gain of 557 over 1926. The 560 foreign day schools had a total enrollment of 19,134. The 18 hospitals and 24 dispensaries treated 417,170. The church erection fund amounted to \$2,510,682.06. Appropriations for pastoral support were made to 141 home missions churches. The Society maintained Bible chairs in four State universities. Work was conducted among the French, highlanders, immigrants, Indians, Negroes, Orientals, Spanish-Americans, and Mexicans. The department of benevolence maintained six homes for children, six homes for the aged, and one hospital. The Men and Millions Movement reported paid pledges amounting to \$91,222.22 during the year, bringing the total up to \$5,993,469.08. In 1927, 25 colleges coöperated with the Board of Education. The imperative need for ministerial pensions brought about the creation of a commission to study the field.

Statistics of the communion for 1927 showed a total church membership throughout the world of 1,573,263 and in the United States and Canada, 1,481,376. Bible school enrollment for the world was 1,198,608; number of churches throughout the world, 9374. The total number of preachers in the United States and Canada was 7274. Contributions reported in the United States and Canada for the fiscal year totaled \$4,087,792.55. Among the periodicals published by the communion are: *World Call*; *Christian Evangelist*; *Christian Unity Quarterly*. The International Convention had as its president for 1927-28, E. S. Jouett Vice President and General Counsel of the Louisville & Nashville Railroad, Louisville, Ky. The president of the United Christian Missionary Society was the Rev. F. W. Burnham, St. Louis, Mo.

DOLE, THE REV. CHARLES FLETCHER. American clergyman, writer and educator, died at Boston, Mass., November 27. He was born at

Brewer, Me., May 17, 1845. He graduated at Harvard College in 1868 and at the Andover Theological Seminary in 1872. He was professor of Greek at the University of Vermont in 1873. From 1874 to 1876 he was minister of Plymouth Church, Portland, Me., and from 1876 to 1916 minister of the First Congregational (Unitarian) Church of Jamaica Plain, Mass. In the latter year he became pastor emeritus. He received the degree of D.D. from Bowdoin College in 1906. Dr. Dole was deeply interested in world peace, and was president of the Association to Abolish War. He was a voluminous writer on religious and civic topics, and wrote many books, among them being: *Early Hebrew Stories* (1886); *The Golden Rule in Business* (1895); *A Catechism of Liberal Faith* (1895); *The Coming People* (1897); *The Theology of Civilization* (1899); *The Religion of a Gentleman* (1900); *The American Citizen* (1902); *The Hope of Immortality* (1906; Ingersoll lecture, Harvard); *The Ethics of Progress* (1909); *The Coming Religion* (1910); *The Burden of Poverty* (1912); *The New American Citizen* (1918); *A Religion for the New Day* (1920).

DOLGORUKOFF, PRINCE PAUL DIMITRIEVICH. Russian patriot, died at Moscow, June 8. He was born about 1865, of a land-owning family possessing large estates, and always took active interest in public affairs. Before the revolution in 1905 he identified himself with the liberal group of the zemstvos, or county councils, and later was a prominent member of the Cadet party. At one time he was a member of the duma, but was more active in the politics of his own city of Moscow. He was at one time prominent in the pacifist movement, but once Russia had entered the World War he supported her cause, and participated with the Red Cross unit on the Galician front. After the Bolsheviks secured power Dolgorukoff was arrested in Petrograd and imprisoned. Later he joined the White movement and then went with Wrangel to the Crimea. He lived in dire poverty in this exile and, becoming homesick in 1925, he returned, disguised as a peasant, to Russia. In the following year he again crossed the Russian frontier and wandered about southern Europe before he was detected and arrested. He was shot without trial, and was considered by many a martyr on account of his courage and patriotism and philanthropic ideas.

lheros, 17,052; San Pedro de Macoris, 13,802; and La Vega, 6561.

PRODUCTION. Agriculture is the chief source of wealth, sugar cultivation being the chief industry. About 12,500 square miles of the total area are cultivable and about 3,000,000 acres are suitable for grazing. In the north central and eastern portions, tobacco, cacao, and coffee are grown, while the largest sugar plantations are in the southern part. The forest area is about 9,500,000 acres. By July 1, 1927, all the principal centrals of the republic had finished grinding, yielding for that grinding season, which commenced in December, 1926, a production of 339,946 short tons of raw sugar. In 1926 the tobacco crop was the poorest in years, the financial returns being \$1,573,458 less than those received for the commodity in 1925. The coffee crop was the largest in the history of the country (total export, 4307 metric tons). The cacao yield was approximately 3000 tons below the normal crop and only 20,084 metric tons were exported as compared with 23,482 metric tons in 1925. Mineral resources of almost every kind are found to some extent within the Dominican Republic.

COMMERCE. Continuing the trend of trade since 1921, the 1926 balance of trade was favorable to the Dominican Republic, although somewhat smaller than that of 1925. The total trade in 1926 amounted to \$48,573,404 as compared with that of the previous year which was \$52,109,663—a decline of \$3,536,259 in 1926. The balance of trade amounted to \$1,218,338, but as the loss in value was distributed throughout both exports and imports, there was little relative change in the margin of exports over imports. Imports in 1926 amounted to \$23,677,553 as compared with \$25,339,052 in 1925, and exports were but \$24,895,871 in 1926 as compared with shipments amounting to \$26,770,611 in 1925. The decrease in total trade of \$3,536,259 was largely accounted for by a decrease of \$2,000,000 in purchases from the United States in 1926. In spite of this decrease, however, the United States retained its supremacy in the Dominican market and supplied over 60 per cent of the goods purchased by the republic, but the trade of the United States with the Dominican Republic was slowly and steadily declining. The following table shows the exports of leading products in 1925 and 1926:

EXPORTS OF MAJOR DOMINICAN PRODUCTS 1924, 1925, AND 1926

Commodity	1924		1925		1926	
	Metric tons	Value	Metric tons	Value	Metric tons	Value
Sugar	230,629	\$21,682,556	301,106	\$15,447,036	387,658	\$14,699,618
Sugar cane	99,210	883,117	179,582	690,641	181,919	645,531
Molasses	62,888	415,277	78,030	731,057	102,015	559,714
Cacao	23,142	2,793,502	23,482	3,875,090	20,084	3,831,432
Leaf tobacco	15,760	2,279,314	22,260	2,765,484	9,754	1,192,026
Coffee	2,238	863,581	2,666	1,294,956	4,307	1,890,441
Woods	22,563	863,304	22,709	878,158	22,105	341,288

DOMINICA. See LEEWARD ISLANDS.

DOMINICAN REPUBLIC (SANTO DOMINGO). A West Indian state occupying the eastern part of the island of Haiti or Santo Domingo, the smaller part being occupied by the Republic of Haiti (q.v.). Capital, Santo Domingo.

AREA AND POPULATION. The estimated area is 19,332 square miles; population, according to the census of 1921, 897,405. The largest cities with their populations at that census were: Santo Domingo, 30,957; Santiago de Los Caba-

FINANCE. Figures from the Treasury Department, for the year 1926, give the receipts and expenditures as follows:

Receipts	
Receiver General of Customs	\$4,808,799.65
Internal revenues	5,527,725.85
Lottery	2,285,690.00
Dominican Central Railway	299,070.05
Total	12,921,285.55
Balance on Dec. 31, 1925	1,608,089.44
Total	14,529,374.99

<i>Expenditures</i>	
Receiver General of Customs	\$295,284.56
Public Debt Service	2,985,977.99
General and special expenditures	8,216,639.34
Lottery	1,586,876.28
Dominican Central Railway	831,810.08
Total	13,416,588.25
Checks paid during the year and credits authorized	65,031.23
Total	13,481,619.48
Balance on Dec. 31, 1926	797,755.51
Total	14,279,374.99

The budget for the year 1927 placed the revenues at \$11,700,250. The public debt on Jan. 1, 1927, was \$15,000,000 or an increase of \$3,825,545 over that of the preceding year.

COMMUNICATIONS. In 1925, 2020 vessels of 2,304,535 tons entered the ports of the republic, and 1511 vessels of 1,856,218 tons cleared. There are two railway systems in the republic, the Dominican Central Railway (for which no information was available) and the Samana and Santiago Railway, a private Scotch-owned line, which runs from Sanchez to La Vega, with connections through Salcedo and Moca to Santiago and with a branch line to San Francisco de Macoris. Operating revenues of the latter line during 1926 amounted to \$209,386 and other revenues to \$762; operating expenses amounted to \$233,047 and other expenses to \$7861. The length of this railway totaled 80 miles. The rolling stock in operation comprised eight locomotives, 55 freight cars and eight passenger cars. No purchases were made during the year but rolling stock was reported in good condition.

GOVERNMENT. The republic is governed under a constitution adopted by the Constituent Assembly on June 13, 1924. Executive power is vested in a president and cabinet of seven ministers. The president is ineligible for a second successive term. The senators and deputies are elected for four years by direct popular vote. Each of the 12 provinces is represented by one senator and (in practice) by two deputies. President in 1927, Horacio Vasquez, who assumed office on July 12, 1924.

HISTORY. The revised constitution of the Dominican Republic, proclaimed June 16, extended the terms of President Vasquez, Vice President Volquez and the members of congress from 1928 to 1930.

DRACHSLER, JULIUS. American sociologist and editor, died at Brown's Mills, N. J., July 22. He was born at Bella, Czechoslovakia. Sept. 5, 1889, and went to the United States in 1903. He graduated from the College of the City of New York in 1912, doing graduate work at Columbia University, where in 1921 he received the degree of Ph.D. He was naturalized in 1913, and for a number of years was interested in social service and educational activities. He was secretary of the faculty of the School for Jewish Communal Work, 1915-18, special expert with the Bureau of War Risk Insurance, 1918-19, and held positions in Jewish welfare and social research organizations. He was assistant professor of economics and sociology at Smith College, 1919-22, and in the latter year became assistant professor in sociology at the College of the City of New York. He wrote: *Democracy and Assimilation* (1920); and *Intermarriage in New York City* (1921).

DRAINAGE. See **SOILS.**

DRAKE UNIVERSITY. An institution of higher education at Des Moines, Iowa; founded in 1881. The number enrolled in the autumn of 1927 was 1728, distributed as follows: College of liberal arts, 621; commerce, 249; education, 362; law, 75; fine arts, 384; Bible, 96. The faculty numbered 90. The fixed endowment amounted to \$1,266,770. The number of volumes in the library was 45,000. President, Daniel W. Morehouse, Ph.D.

DRAMA. See **THEATRE** and articles on **LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE; SCANDINAVIAN LITERATURE; SPANISH LITERATURE.**

DREW, JOHN. American actor, died at San Francisco, Calif., July 9. He was born at Philadelphia, Pa., Nov. 13, 1853, the son of John Drew, Irish comedian, who died in 1862, and Louisa (Lane) Drew, actress, who died in 1897. He was educated by private tutors and at the Episcopal Academy, Philadelphia, Pa. On Mar. 23, 1873, he made his first appearance at the Arch Street Theatre, Philadelphia, as Plumper, in *Cool as a Cucumber*, in a company managed by his mother. He played with Edwin Booth, Fanny Davenport and other stars, in various rôles, until 1870, when he became leading man in Augustin Daly's company at Daly's Theatre, New York. Here he created many rôles and acted comedy parts in a pleasing and acceptable manner. In Daly's revivals of the classic comedies, such as *The Taming of the Shrew*, in which Drew took the part of Petruchio, and *The School for Scandal*, in which he was Charles Surface, his work was of a high order. In 1892 he began his career as a star, playing Dr. Paul Blondet in *The Masked Ball*, and Frederick Ossian in *The Butterflies* with Maude Adams. Others of his rôles were in: *The Squire of Dames* (1895-96); *Rosemary* (1896-97); *A Marriage of Convenience*; *One Summer's Day* (1897-98); *The Liars* (1898-99); *The Tyranny of Tears* (1899); *The Circle* (1921-23); as Sir Peter Teazle in a revival of *The School for Scandal* (1923); and in *Trelawny of the Wells* (1925). Mr. Drew throughout his life sought to uphold the best traditions of the stage, and in comedy parts he had few equals. His sister, Georgia Drew, was married to Maurice Barrymore, a celebrated actor, and was the mother of the well known players, Ethel, John and Lionel Barrymore.

DROPPERS, GARRETT. American economist and professor emeritus of political economy at Williams College, died at Williamstown, Mass., July 7. He was born at Milwaukee, Wis., Apr. 12, 1860, and after graduating from Harvard in 1887 pursued graduate studies in economics and finance at the University of Berlin for two years. In 1889 he became professor of political economy and finance at Tokio University, Japan, serving until 1898, when he became president of the University of South Dakota of which he was head until 1906. In 1907 he became professorial lecturer on political economy at the University of Chicago, and in 1908 professor of economics at Williams College, holding the latter chair until 1922, when he became emeritus professor. He was secretary of the Commission on Commerce and Industry of Massachusetts, 1907-08, and a member of the Massachusetts Civil Service Commission, 1913-14. From August, 1914, until 1920 he was American minister to Greece and

Montenegro. He wrote: *Economic History of the Nineteenth Century* (1923).

DUKE UNIVERSITY. An institution for higher education at Durham, N. C.; established in 1924 by the expansion of Trinity College, made possible through benefactions from James B. Duke, as described in the article on the University in the 1925 YEAR BOOK. The enrollment for the autumn of 1927 was 1638 and for the summer session 1395. In the autumn the faculty numbered 148, of whom 27 were new appointments. The endowment funds of the University amounted to \$27,000,000, and the income for the year was estimated at \$630,000. Up to the end of 1927 eleven new buildings had been completed, including a new library; the Union, constructed at a cost of about \$1,000,000, for recreational and student activities; a chapel; five dormitories; a class room building, a science building, and a faculty apartment house for the use of single and married professors. Work was started on a forty-five hundred acre tract of land, a mile from the campus, on which will be located a group of forty or more buildings, built of native North Carolina stone of Cambrian formation, taken from a quarry owned by Duke University. Among the outstanding appointments to the teaching staff were: Dr. William McDougall, formerly of the department of psychology of Harvard University; Dr. W. S. Pearce, former head of the department of biology, University of Wisconsin; Dr. J. Fred Rippy, of the department of history of Chicago University; Dr. Wilburt Davison, assistant dean of Johns Hopkins Medical School, to become head of the Medical School to be started in September, 1929. Two members of the history department, Doctors E. M. Carroll and J. Fred Rippy, held Guggenheim Fellowships, which enabled them to do research work during a leave of absence granted by the University. The Angier B. Duke Memorial Loan Fund for students amounted to \$450,000. President, William Preston Few, Ph.D., LL.D.

DUMBLE, EDWIN THEODORE. American geologist, died at Nice, France, January 27. He was born at Madison, Ind., Mar. 28, 1862, and graduated from Washington and Lee University. From 1887 to 1896 he was state geologist of Texas, and from 1897 to 1925 consulting geologist and manager of the oil properties of the Southern Pacific Company. He was also consulting geologist for the Pacific Oil Company, and had many clients among the oil companies in the southwestern part of the United States. He was a fellow of the Geological Society of America, the Texas Academy of Science and the American Association for the Advancement of Science, and a member of the American Institute of Mining Engineers, the Association of Petroleum Geologists, and other organizations of similar nature. He wrote: *Brown Coal and Lignite; Geology of East Texas*, and many reports on the geology and the mineral resources of Texas and Mexico.

DUNCAN, ISADORA. American dancer, was killed at Nice, France, September 14, in an automobile accident. She was born at San Francisco in 1880, and was for a time a dancing teacher at New York, where she attempted to revive classic dancing, having been trained by her sister Elizabeth, who had been on the stage. With a slender and well proportioned figure, Isadora was able to reproduce the grace and the poses of the figures on old Greek vases. Her efforts were not warmly received in America, but in

London and on the European continent she became popular and established classes where girls of tender age were taught to dance according to her ideas. She was the first to popularize the barefoot dance, using simple, free draperies, and making it a distinct antithesis to ballet and toe dancing. She was able to interpret music by means of dancing, her method involving an economy of movement which served to illustrate the meaning of the music. In this way she devised dances interpretative of Beethoven, Gluck and Chopin. She lived for the most of her time in Paris. She married a young Russian poet, Serge Yessenin, with whom she visited the United States in 1922. Later she divorced Yessenin, who in December, 1925, committed suicide at Leningrad. Previously, in April, 1913, Miss Duncan's two children, Deirdre, aged six, and Patrick, aged three, with their nurse, were drowned in the Seine as the result of a motor accident. Miss Duncan shortly before her death had finished a volume of memoirs, *My Life*, which expressed her ideas of the dance and its relations to art, and it was published during the year.

DUNKERS OR DUNKARDS. See BRETHREN, CHURCH OF THE.

DUNN, ARTHUR WALLACE. American educator and Red Cross official, died at Washington, D. C., November 15. He was born at Galesburg, Ill., Mar. 12, 1868, and was graduated at Knox College; he also studied at the University of Chicago, and was a fellow in sociology at the latter institution, 1893-96. He was an instructor in English and lecturer in sociology, University of Cincinnati, 1896-98; extension lecturer, 1896-1900; head of the department of history and civics, Shortridge High School, Indianapolis, Ind., 1900-10; director of civic education in the public schools of Indianapolis, 1906-10; executive secretary of the Public Education Association, New York City, 1911-14; specialist in civic education, United States Bureau of Education, Washington, D. C., 1914-21; associate national director of the American Junior Red Cross, 1920-21, and national director from 1921. He wrote: *The Community and the Citizen* (1907); (with others) *The Teaching of Community Civics* (1915); *Social Studies in Secondary Education* (1916); (with Hannah Margaret Harris) *Citizenship in School and Out* (1920); *Community Civics and Rural Life* (1920); *Community Civics for City Schools* (1921).

DUPUY, du'pwe, PAUL JACQUES. French publisher, editor and statesman, died at Versailles, July 10. He was born at Paris in 1878, the son of Jean Dupuy, minister of agriculture in the Waldeck-Rousseau cabinet and the founder of *Le Petit Parisien*. The son studied law, and after being admitted to the bar became connected with his father's publishing enterprise, with which he was identified throughout his life. In 1910 he was elected deputy from the Argeles district, and in January, 1920, he took his father's place as senator from Hautes-Pyrénées. In 1925 he was elected secretary of the Senate. He was a member of the Commission of Foreign Affairs and of the Caillaux war debt commission which visited Washington in 1925 but failed to effect an agreement on the French debt to the United States. He was a chevalier of the Legion of Honor and a member of the Syndicat de la Presse Parisienne. *Le Petit Parisien* as developed by Senator Dupuy achieved a large circulation, being

one of the most successful papers in the world. It was written without bias, presenting the news from a non-partisan standpoint, and incorporated many enterprising features. Senator Dupuy was interested in other publishing projects, among the magazines he controlled being *Excelsior*, an illustrated daily newspaper; *Science et Vie*; *d'Omnia*; *du Miroir des Sports*; *de l'Agriculture Nouvelle*; and *de Nos Loirs*. Politically, Senator Dupuy was a supporter of the bloc nationale and Premier Poincaré, wielding his influence in the support of the premier against the left wing of Socialists and Communists and the right wing of Monarchists and Fascists. He brought to his various public enterprises many original ideas and adapted modern methods to them.

DUTCH EAST INDIES. A possession of the Netherlands in the East Indies, comprising the territory of Dutch East India and consisting of the group of islands in the Pacific lying between 6° N and 11° S, and between 95° and 141° E longitude. Capital, Batavia.

AREA AND POPULATION. The usual method of dividing the colony is as follows: (1) Java and Madura, divided into 17 residencies, each under a resident and several assistants at the head of a large number of native officials; (2) the Outposts, consisting of Sumatra, Borneo, Celebes, a part of New Guinea, the Molucca Archipelago, the Sunda Islands and other small islands. Under functionaries variously entitled governor, resident, controller, etc. The area is estimated at 733,642 square miles; population, according to the census of 1920, 49,350,834. In the same year the Europeans numbered 169,708, and the Orientals, other than native, 876,506, mostly Chinese and Arabs. The estimated population on Dec. 31, 1925, was 51,013,878.

PRODUCTION. The harvested area under various native crops (first and second) in Java and Madura was in 1925 as follows: in acres; Irrigated rice, 7,191,464; non-irrigated rice, 950,683; maize, 3,949,548; cassava, 1,813,594; sweet potatoes, 366,583; groundnuts, 461,656; soya beans, 456,181; other pulses, 451,927; tobacco (native), 343,089; other secondary crops 1,353,251; total, 17,337,976. In the same year, the harvested area of "other secondary crops" were potatoes, 42,443 acres; native sugar cane, 39,393 acres; indigo, 13,714 acres; and capsicum, 121,612 acres. The area under sugar was 435,595 acres; the total production, 2,299,875 tons; and the factories engaged in this industry, 179. The amounts of other products were: Coffee, 61,163 tons; rubber, 106,106,000 kilos; cinchona, 10,719,000 kilos; tobacco, 56,682,000 kilos; tea, 52,682,000 kilos; cacao, 745,000 kilos; and oil palms, 8,739,000 kilos of oil. The total yield of the tin mines worked by the government and private concerns in 1925 was 32,474 metric tons. In the same year the yield of the principal coal mines in Java, Sumatra, and Borneo was 1,400,727 tons. While the greater part of the soil of Java is claimed by the government, private estates are found chiefly in the western part, and mainly in the hands of the Europeans and Chinese.

COMMERCE. The following table published by the U. S. Bureau of Foreign and Domestic Commerce in September, 1927, gives the latest available statistics on trade:

TEN LEADING COMMODITIES IN THE EXPORT AND IMPORT TRADE OF THE DUTCH EAST INDIES

[Values in thousands of florins]

<i>Exports</i>		1924	1925
<i>From Java and Madura:</i>			
Sugar	489,960	367,280	
Rubber and guttas	61,820	142,190	
Tea	80,680	68,620	
Tobacco	30,920	36,780	
Coffee	86,080	85,800	
Fibres	27,230	27,840	
Tapioca and products	20,430	15,600	
Cinchona bark and quinine	14,360	12,770	
Copra	17,690	9,290	
Pepper	8,560	8,800	
All other	112,860	117,200	
Total	900,590	837,170	
<i>From Outer Possessions:</i>			
Rubber and guttas	140,810	444,350	
Petroleum and products	155,750	171,150	
Copra	79,720	98,100	
Tobacco	92,710	73,690	
Tin and tin ore	35,180	32,980	
Coffee	29,500	32,430	
Crude tanning and dyeing materials	14,370	19,400	
Pepper	12,110	15,660	
Tea	12,900	10,750	
Agave fibre	8,100	8,110	
All other	48,870	46,000	
Total	630,020	947,620	
<i>Imports</i>			
<i>Into Java and Madura:</i>			
Textiles and yarns	152,830	197,760	
Foodstuffs, except rice	69,480	72,440	
Rice	34,010	34,770	
Machinery and tools	28,260	29,910	
Iron and steel and manufactures	26,160	26,880	
Ogars, cigarettes, and tobacco	19,260	17,510	
Fertilizers	19,780	15,750	
Wearing apparel	10,040	12,690	
Pottery and glassware	8,910	11,060	
Motor cars	6,000	9,510	
All other	92,800	102,690	
Total	466,530	530,970	
<i>Into Outer Possessions:</i>			
Textiles and yarns	45,910	69,890	
Rice	29,640	40,090	
Foodstuffs, except rice	27,950	38,240	
Iron and steel and manufactures	21,880	25,680	
Ogars, cigarettes, and tobacco	19,890	23,260	
Machinery and tools	18,140	17,220	
Wearing apparel	4,200	6,560	
Motor cars	1,890	5,840	
Pottery and glassware	8,910	5,800	
Tin and manufactures	4,530	5,110	
All other	39,350	50,210	
Total	211,740	287,400	

FINANCE. The budget for the Dutch East Indies for the year ending Dec. 31, 1928, called for total revenues of 747,554,315 florins and expenditures of 793,066,696 florins, leaving a deficit of 45,522,381 florins. The ordinary revenues were estimated at 742,617,257 florins and ordinary expenditures at 739,862,325 florins. Extraordinary revenues were expected to yield 4,927,058 florins, while extraordinary expenditures were estimated at 53,204,371 florins. The estimated revenues for 1927 were 701,093,925 and the expenditure, 759,427,788. The public debt on Dec. 31, 1926 was 1,089,426,846 guilders.

COMMUNICATIONS. The Railroads of the Dutch East Indies are divided into two groups, the State railways and those privately operated by incorporated companies. Of the privately owned railways, the Netherlands East Indian Railway in Middle Java is the most important, and is composed of a number of consolidated lines. The state railways comprise the greater part of the transportation system and have a total trackage of 4,138 kilometers as compared with 2950 kilo-

meters for all the privately owned lines combined. In the outer possessions all the railway lines are government owned, except the important railroad, Deli Spoorweg Maatschappij, which serves the highly developed part of northern Sumatra about Medan. In 1925, 10,953 steamers and 9021 sailing vessels, of 7,853,441 tons and 536,163 tons respectively entered the ports of the Dutch East Indies.

GOVERNMENT. The territory is under the sovereignty of the Netherlands (q.v.) but is partly under direct government and partly under subject native officials. In 1917 and again in 1925 the mother country granted certain measures of home rule. The chief executive authority is the governor-general who is aided by a council of five members which acts partly as a legislative and partly as an advisory body. The governor-general and the council are nominated by the crown. Governor-General in 1927, Dr. A. C. D. de Graeff (appointed Mar. 26, 1926).

DUTCH GUIANA, ge-n'na, or **SURINAM**. A possession of the Netherlands on the north coast of South America lying between French Guiana on the east and British Guiana on the west, bounded on the south by inaccessible territory reaching to the Tumuc-Humac mountains. Area, 54,291 square miles: population, Dec. 31, 1925, 139,869, including Negroes and Indians. Capital, Paramaribo, with 45,554 inhabitants. The movement of population in 1925 was: Births, 3931; deaths, 1772; marriages, 395. Among the chief products are sugar, cacao, bananas, coffee, rice, maize, rum, and molasses. Gold production in 1925 was 308,533 grams, and that of balata, 734,080 kilos. The executive authority rests with a governor and an assisting council, both nominated by the crown. Governor in 1927, Baron van Heemstra, who was appointed on May 23, 1921.

DUTCH REFORMED CHURCH. See **REFORMED CHURCH OF AMERICA**.

DUTCH WEST INDIES. The name applied to the Dutch possessions in the West Indies, viz., Dutch Guiana (q.v.) and Curaçao (q.v.).

DYER, BRIGADIER-GENERAL REGINALD EDWARD HARRY. Anglo-Indian officer, died at Bristol, England, July 23. He was born at Simla, India, Oct. 9, 1864, and was educated at Middle-town College, County Cork. He was commissioned in the West Surrey regiment in 1885, but later transferred to the Indian Army in the Twenty-fifth Punjab. He served in various campaigns in India, and at the outbreak of the World War was in command of the Forty-fifth Infantry Brigade. He was placed in charge of the eastern Persian cordon which prevented German parties from crossing into Afghanistan. For this work he was made a C.B. in 1917. In April, 1919, when Dyer was brigade commander at Julundur, an outbreak in the Punjab occurred at Amritsar, resulting in the destruction of buildings and the deaths of five Englishmen. Dyer immediately took charge of the situation, and, enforcing martial law by vigorous methods, restored order by firing on the inhabitants of the city. It was officially stated some months afterwards that 379 persons were killed and about 1200 wounded, but at the time of occurrence this information was withheld by the censor and the outbreak attracted little attention in England. The Indian government at first shielded General Dyer, but later censured him, and his action resulted in a controversy which led to the resig-

nation of General Dyer as brigade commander and his relief from further employment in India. For several years General Dyer's course was debated. He had many supporters as well as opponents. While the House of Lords adopted a resolution on July 20, 1920, deploring the conduct of the case of General Dyer as unjust to him, nevertheless the action of the British commander-in-chief in India in removing him from his command in the Punjab and barring him from future army service was upheld by the army council reviewing the findings of a commission. He was the author of: *The Raiders of the Sarhad* (1921).

DYESTUFFS. See **CHEMISTRY, INDUSTRIAL**. **DYNAMO-ELECTRIC MACHINERY.** The year was notable for the construction and installation of larger generators, motors, frequency-changers and the like than had characterized 1920. The two-cylinder, 168,000-kw. turbine that was built by the General Electric Co. and installed at the Hell Gate station, New York City, was extraordinary not only for its size, but also on account of the unusually high speed at which it operated, namely 1800 revolutions per minute. A single-cylinder turbo-generator of 75,000 kw. capacity was under construction for the Buffalo, N. Y., General Electric Co., designed to operate at 1600 revolutions per minute. One of the large manufacturing companies was building two generators, each nominally rated at 90,000 kw., at 90 per cent power factor, the largest in the world both in capacity and dimensions; to be driven by the two largest tandem-compound turbines ever built. These generators were designed to operate at 1500 revolutions per minute, and to generate electricity at 16,500 volts.

Water-wheel generators being built for the Conowingo development on the Susquehanna River were of record size and capacity, designed to run at 82 r. p. m. and develop 40,000 kw., and were to be 38 ft. outside diameter. Two others, of vertical type, for the Carolina Power Co., developed 45,000 kw. at 400 r. p. m. The increasing employment of electric drive for naval as well as merchant vessels was exemplified in the U. S. Navy airplane-carriers, one of which, the *Saratoga*, was placed in commission late in the year. Her propelling machinery had a total rating of 180,000 horse power, each one of her four shafts being driven at 317 r. p. m. by two 22,500-h.p. motors. An improved method of construction employed for electric machinery was the employment of structural shapes, plates and slabs which were welded in the desired form, thus greatly reducing weight as compared with castings and rendering it possible to ship many large machines completely assembled. Several new methods of automatic fire-extinguishing apparatus were incorporated in the design of large generators, as well as more efficient systems of cooling. A 40-h.p. mine locomotive was built with totally enclosed motors for the purpose of making it proof against explosive gases, as well as to enable it to operate through gritty material and even water. For grinding, sanding, buffing and similar operations, small high-speed motors were used to an increasing extent. Some of these were designed to run at 32,000 r. p. m., and generators of special type were built to supply them with 540-cycle, 3-phase energy. For continuous duty, such as operating domestic refrigerating plants, motors of somewhat different design were built, having characteristics particularly adapt-

ed to such purposes. Of unusual application was the motor outfit applied to a shovel, said to be the largest in the world, having a dipper capacity of 15 cubic yards, that was under construction at the end of the year for an Illinois coal company for use in open pit mining. It was designed exclusively for electric operation on alternating current at 4000 volts, supplied through a 1000-foot cable wound on a reel at the rear of the chassis. The main motor was rated at 1700 horse power, and it operated a generator from which current at other voltages could be drawn for the several other motors that controlled the boom, dipper and other parts of the machine.

DYSENTERY. In the form of dysentery known as the amebic, which is due to the presence of a protozoön, the *endameba histolytica*, it has been commonly believed that while many people may contain this parasite in the intestines but few develop the disease. This recently was shown to be fallacious, for there were at least five species of ameba which might be present in the intestine, belonging to four different genera, yet of these but one is capable of causing dysentery. This does not alter the fact that many carriers of the true disease organism are free from dysentery. It is evident that a mere study of carriers will serve no useful purpose alone. Of late years amebic dysentery has been encountered in the United States, and an episode in Chicago is described in the *Journal of the American Medical Association* for Mar. 26, 1927, by Kaplan and two others. During the preceding year nearly 40 cases had been treated in the Cook County Hospital, seven or eight among employees and guests of one hotel, while most of the others had worked along the railroads. As food transmission was suspected, 720 food handlers were investigated, but only 2 per cent were found to be carriers, while there was but one actual case of dysentery. Both carriers and clinical cases were isolated for treatment. This campaign was still in progress at the end of the year.

EARTH, STUDY OF. See GEOLOGY.

EARTHQUAKES. It is estimated that an earthquake is felt in some part of the world on an average of at least 4000 times annually; in the United States alone, one or two hundred usually are reported each year. Fortunately, the vast majority are feeble and harmless, or else occur under the sea or in thinly populated districts. The year 1927 had the usual quota of quakes, many of which caused considerable local damage and loss of life, and a few of high ranked as major disasters.

On March 7, a disastrous quake in central and western Japan destroyed many towns, injuring 6734 people and killing 3274; the centre was in the province of Tango, near the region of the Tajima quake of May 23, 1925. On May 1, Kansu province in western China was devastated by a quake which killed about 100,000 people; the epicentre was 130 miles to the west of that of the gigantic quake of Dec. 16, 1920; it is quite unusual for two such severe quakes to occur in the same region within so short a period of time. On July 11, heavy damage was inflicted in Palestine by the first great quake that region since 1837; 268 people were killed, 800 injured. A series of severe shocks, beginning on February 14, caused considerable damage, suffering, and loss of life in Jugoslavia.

An earthquake of great magnitude, but without serious consequences (because of the sparsely settled character of the country) occurred in Alaska on October 24; it was centred about 75 miles north of Yakutat Bay, the scene of the tremendous quake of 1899 when uplifts as great as 40 feet took place.

The region of Calexico and Mexicali on the United States-Mexican border was shaken January 1, and damage was done to a number of towns, but there were no casualties. See SEISMOLOGY.

ECUADOR, ñk'wá-dór. A South American republic on the northwest coast of the continent between Colombia on the north and Peru on the south. Capital, Quito.

AREA AND POPULATION. The area in 1927 was still undetermined because of the boundary dispute with Peru, but was variously estimated by six different authorities at from 116,000 to 276,000 square miles. The population was estimated at approximately 2,000,000, about three-quarters of whom were Indians and the remainder of mixed blood. The last official census in 1903 placed the population at 1,328,821. The chief towns with their populations are: Quito, 80,702; Guayaquil, 100,000; Cuenca, 30,000; Riobamba, 12,000; and Ambato, Loja, and Latacunga, each with about 10,000 inhabitants.

EDUCATION. Primary education is free and compulsory. Institutions of higher learning include the Central University at Guayaquil and Azuay University at Cuenca, and a Law College at Loja.

PRODUCTION. Cacao is the chief source of wealth of the country. The production in 1925 was 513,160 hundredweight as compared with 584,840 in 1924. Other crops are coffee, rubber, ivory, nuts, tobacco, and sugar. Ecuador has practically monopolized the production of Panama hats, which are produced at the rate of 700 dozen per month. The mineral resources include gold, silver, petroleum, copper, iron, lead, coal, and sulphur, but mining is almost exclusively confined to gold, of which practically the entire output is exported to the United States.

COMMERCE. The accompanying material on the commerce of Ecuador was published in 1927 by the Pan American Union. The total foreign trade for 1926 amounted to 110,644,179 sucres, represented by imports to the value of 47,073,069 sucres, and exports of 63,571,110 sucres. For the preceding year, 1925, the figures were: Imports, 55,234,924 sucres; exports, 72,511,616 sucres; total 127,746,540 sucres. Expressed in United States currency, estimating the sucre at 48.6 cents par value (10 sucres equal £1), the foreign trade in 1926 was: Imports, \$22,877,511; exports, \$30,895,659; total, \$53,773,070. The figures for 1925 were: Imports, \$26,844,173; exports, \$35,240,645; total, \$62,084,818.

TEN-YEAR TABLE OF FOREIGN TRADE

Year	Imports Sucre	Exports Sucre	Total Sucre
1917.....	20,940,097	33,558,014	54,498,111
1918.....	16,690,720	27,499,535	44,190,255
1919.....	24,007,688	43,220,558	67,228,246
1920.....	43,494,555	49,891,926	93,386,481
1921.....	23,486,190	38,968,899	57,455,089
1922.....	33,581,897	46,106,913	79,688,810
1923.....	36,804,758	38,386,359	75,191,117
1924.....	52,003,021	61,267,919	113,270,940
1925.....	55,234,924	72,511,616	127,746,540
1926.....	47,073,069	63,571,110	110,644,179

FINANCE. The last available budget was that for 1926 when receipts and expenditures balanced at 41,938,000 sucres. The financial commission under Professor Kemmerer, mentioned in the preceding YEAR BOOK, prepared 25 projects for the improvement of financial conditions in the republic, some of which are the following: Procedure for handling customhouse documents of foreign origin, creation of the Central Bank of Ecuador, coinage law, general banking law, regulations for agricultural insurance contracts, organic budget law, memorandum on the organization and activities of the administration department of the government, reorganization of government accounts and the establishment of a comptrollership, project of law for the revision of the present tax system on rural property, amendments to the penal law, project of law to take the place of the actual income-tax law, project of a law on administration of customhouses, report on public credit, report on public works, report on proposed railroad from Quito to Esmeraldas, project of amendments to the Civil Code of Judicial Procedure and the organic law of the judicial power, report on the liquor monopoly, report on stamp law, project of law on amendments to certain articles of the constitution, and report on municipal finances. One of the projects was put into effect by virtue of a law creating the Central Bank of Ecuador in March, 1927.

COMMUNICATIONS. Guayaquil is visited by the steamships of nine European lines by way of Magellan Straits, as well as by vessels plying only on the Pacific. There are about 500 miles of railways. During 1927 the government appropriated 3,852,000 sucres for railroads, distributed as follows: 120,000 for El Oro Railroad; 60,000 for the Ambato-Curaray Railroad; 162,000 for the Bahia-Chone Railroad; 1,100,000 for the Puerta Bolivar-Loja Railroad; 500,000 for the railroad to the coast; 1,000,000 for the Sibamba-Cuenca Railroad; and 910,000 for the Quito-Esmeraldas Railroad.

GOVERNMENT. Executive power is vested in a president elected for four years, who acts through a cabinet of five ministers; and legislative power in a congress of two houses, a senate of 32 members and a chamber of deputies of 48 members. Provisional president in 1927, Dr. Isidro Ayora. See preceding YEAR BOOK.

HISTORY. The year was a comparatively uneventful one for Ecuador. The most pressing internal problem was the relations between the government and the clergy. In the fall the government issued a decree which forbade foreign churchmen of all denominations entrance into the country, with certain exceptions prescribed by the Minister of the Interior. Several deportations of priests occurred during the year, because the government believed they were stirring the people with revolutionary activities.

EDUCATIONAL PSYCHOLOGY. See PSYCHOLOGY.

EDUCATION IN THE UNITED STATES. STATISTICS. *Attendance.* Statistics of attendance for the public schools for the school year ending June 1925 were announced by the United States Bureau of Education as follows: The estimated number of children 5-17 years of age inclusive was 29,705,264. Of this number 24,650,291 were enrolled in some school either public or private. Those between the ages of 5 and 17 are 26.2 per cent of the total population. This per cent had remained nearly stationary since 1910. Those who were enrolled as pupils are 21.7 per cent of the total population. This was the highest that had been reported by the Bureau of Education.

The most pronounced change had taken place in the per cent of pupils who attend each day. In 1925 this was 80.5 per cent. In 1910 it was only 68.6 per cent.

The elementary schools enrolled a total of 20,158,566 pupils, while the high schools enrolled 3,363,515. In the total enrollment there are 116,591 more boys than girls. In the high schools, however, the girls outnumber the boys by 156,807. The per cents of pupils enrolled in the elementary schools in the eight grades, beginning with the first, are 19.0, 13.7, 13.4, 13.2, 12.3, 10.7, 9.5, and 7.3 respectively. In the high school the enrollments for each of the four years beginning with the first are 39.0, 26.6, 19.6, and 14.8 respectively. When these per cents are compared with those for previous years, they show that fewer pupils are being held back in the first and second grades.

The most noteworthy change in attendance statistics is found in the change that has taken place in the per cent of the school population enrolled in high schools. In 1925 this was 14.8 per cent. In 1920 it was 10.2 per cent, in 1910 it was 5.1 per cent, while in 1900 it was only 3.3 per cent.

The average number of years of school life which children have varies from 4.05 years in Alabama to 9.08 years in Massachusetts. The average for the country is 6.92 years.

The average number of days that schools were in session has changed from 144.3 days in 1900 to 169.6 in 1925.

Costs. The total expenditure for schools per capita of population in 1925 was \$17.15. This is an increase from \$9.80 in 1920 and \$4.64 in 1910. The total expenditure per pupil in average attendance in 1925 was \$98.10. In 1920 it was \$64.16, and in 1910 only \$33.23. On the average it cost 57.9 cents per day for each pupil who attended school in 1925. In 1920 it cost 39.6 cents and in 1910 the cost was 21.1 cents. The total expenditures for all public school purposes in 1925 was \$1,946,096,912. The revenue for the public schools was derived as follows: From permanent funds and lands 1.4 per cent, from State taxes 14.1 per cent, from county and local taxes 78.8 per cent, and from all other sources 5.7 per cent. The school funds were spent as follows: For sites, buildings, etc., 22.3 per cent, for salaries 51.7 per cent, and for all other purposes 26 per cent.

VALUE OF SCHOOL PROPERTY. The value of all school property in 1925 was \$4,252,328,900. This is an increase of nearly 75 per cent over the

values for 1920. The number of school buildings has steadily decreased since 1915. In that year there were 277,941 buildings. In 1925 there were 258,859.

TEACHERS. A total of 777,945 teachers were employed in the public schools. Of these 16.9 per cent or 131,164 were men. The average annual salary of all public school teachers was \$1,252. In 1920 the average salary was \$871.

ADULT EDUCATION. In recent years the education of adults has received much consideration. Attention was directed toward the need by the 1920 census, which showed that approximately 6 per cent of those 10 years old and older could not write in any language. The United States Commissioner of Education stated that, "the general characteristics of what may properly be considered organized adult education are: (1) The individual must have passed the compulsory school age; (2) The work must be voluntary; (3) it must be somewhat intensive and should continue for some time; and (4) it must be done during the leisure time of the individual."

One of the major purposes of adult education relates to reeducation and the ultimate elimination of illiteracy. Most of the States make some provision for the teaching of adult illiterates. Many States provide funds that are to be matched by the local district in which the classes are held. Twenty-two States give aid from state funds varying from 20 per cent to 100 per cent of the total cost of instruction. In 1925 the States reported that classes for adults were held in 1500 centres and 310,000 students were enrolled.

A second purpose is to teach the foreign-born illiterates. Classes for non-English speaking aliens are established in most of the large cities. The State of New York alone spent \$750,000 for this purpose. The classes were attended by 75,000 students. (See ADULT EDUCATION, AMERICAN ASSOCIATION FOR.)

University extension courses are provided by most State universities, and State agricultural colleges. Several of the larger universities, notably Chicago and Columbia, offer a wide range of correspondence courses. Radio is also being utilized to teach those who cannot attend colleges. Short courses in foreign languages, sciences and history are being broadcast. No way has yet been devised by which the institutes are able to give credit for study done in this way.

For many years there have been various correspondence schools conducted on a commercial basis. These schools still exist and render a worthy service. Never before, however, have private institutions interested themselves in this work.

The American Association for Adult Education was organized in 1926. This organization has endeavored to cooperate with all of the adult education organizations. The association has been able to encourage several noteworthy investigations. Among these is a study of adult education conducted by Dr. E. L. Thorndike. The results of his experiments indicate that persons 35 years old or older do not learn as quickly as those who are 20 to 24 years old. In some traits he found that the older persons gained only about three-fourths as much as the younger, while in others, the gains made by the older persons were four-fifths as much as those made by the younger. The conclusion is reached that

persons under fifty should seldom be deterred from trying to learn something which they really need to learn by the fear that they are too old, and, to a lesser degree, this is true after 50 also.

The new School for Social Research in New York City was conducting a class in teacher training for adult education.

ANTI-EVOLUTION LEGISLATION. The attention of educational and scientific bodies continued to be directed toward the attempts that had been made to outlaw the teaching of evolution in public schools and colleges. No new laws were enacted during 1927 but no less than thirteen anti-evolution bills were introduced in various State legislatures. In three States, Tennessee, Mississippi, and Texas it was against the law to teach evolution. The American Association of University Professors adopted two resolutions that have to do with the spread of anti-evolution legislation. The first which was introduced by Professor A. O. Lovejoy of Johns Hopkins University is as follows:

Resolved, That this association take the initiative in bringing about a more effective cooperation between all groups of organizations interested in opposing legislative restriction on freedom of teaching in state-supported institutions and in defending the principle of a separation of church and state in educational matters.

The resolution which follows was introduced by Professor R. H. Johnson, of the University of Pittsburgh:

Resolved, That when some similar organization is formed it should investigate the legality of the action of the Texas State Text-book Commission, which has removed all mention of evolution from text-books in state-supported schools.

COMMERCIAL AND BUSINESS SCHOOLS. The United States Bureau of Education reported a decrease in the number of private commercial and business schools since 1920. At that time there were 903 institutions with an enrollment of 336,032 students. In 1925 there were 739 such schools and an enrollment of 188,363; at least 275 of the schools that reported in 1920 had been discontinued. There were 20 public commercial and business high schools enrolling 35,120 students. The enrollment in stenography was 16,004, in bookkeeping there were 12,535, and in combined courses, 10,771.

In 1924 a total of 3742 public high schools had 430,975 enrolled in commercial courses, and 740 private high schools enrolled 11,941 students. In 1918 there were 2953 public high schools in which 278,275 students were in the commercial departments. This large increase in the number of public high schools offering commercial courses accounts for the decrease in the number of private schools.

THE CRANBROOK FOUNDATION. George C. Booth, publisher of the *Detroit News*, gave \$8,500,000 to complete what was to be known as the Cranbrook Foundation. He had given in all \$12,000,000 to create this educational and cultural centre. Mr. Booth began by building a school for children on his large estate outside of Detroit; later the population increased and he built the Cranbrook School for boys and still later a beautiful church. Plans were being completed to build a school for girls, a school for arts and crafts and an academy of arts. It was the hope of Mr. Booth to attract leading artists and craftsmen as masters who would live in the buildings and have the students in the surrounding art community

serve them much as apprentices would. The foundation will be under the management of a small non-sectarian board of trustees.

CURRICULUM. Changes and improvements of courses of study for the public schools continued to command the attention of school people. During 1927 secondary school courses received most consideration. Two factors are combined to make curriculum a confusing matter. The first of these is the conflicting notions that are held by those who are regarded as leaders in this work. The National Society for the Study of Education, through a committee, composed of the outstanding specialists in this field, prepared a year book which was presented at the February meeting of the Department of Superintendence. The effort was made to reach an agreement upon the foundation of curriculum-making. The report signed by the 12 members of the committee covers less than 21 pages. These same 12 specialists used a total of 121 pages to describe the particular interpretations that each wished to have made of the report. These interpretations differed.

While the theories regarding the content of the curriculum varied greatly, the new ones that have appeared do not differ greatly from each other or from those that have been in operation in the public schools. The expression of doubts concerning the effectiveness of the plans that have been employed to bring about changes in course of study were heard with increasing frequency.

The second factor that tends to prevent changes in the curriculum is found in the attitude of society. There are many evidences that an influential part of society is no longer willing to leave the selection of subject matter to the schoolmaster. This opposition was shown in a spectacular way by the controversies that have raged in regard to history texts and the teaching of evolution. In New York City, the schools still were working under the influence of a movement that opposed the use of certain texts in United States history. Among other things it was alleged that they did not treat the forefathers with proper respect. During the year 1927 a similar controversy existed in Chicago. A legal ban upon the teaching of evolution prevailed in several States. The Science League of America received the report of a survey committee, headed by Dr. David Starr Jordan, which shows that, "during 1927 thirteen anti-evolution bills were introduced in various State Legislatures and, while none of them passed, several of them were defeated by very close margins."

Less spectacular but perhaps of greater importance were the increasing number of laws that make mandatory the teaching of certain subjects. These prescriptions vary from the observance of special days to the teaching of safety and the prevention of fire.

A complaint that was often heard was that the school attempts to teach too many subjects with the result that none is well mastered by the pupils, yet the tendency was to crowd more subjects into the curriculum and to take none out. The attempt to include geography, history, and civics in one subject, called "social science," has not met with pronounced success.

The attention that had been given to curriculum revision during several years past had a number of valuable effects; permanent among these was the increased knowledge of

educational problems which the teachers themselves now have. Curriculum revision has become a part of the teacher's duty, whereas earlier she or he had no part in this service.

Confusion as to what should be taught will continue until there are new definitions of the purposes of public schools. With such exceptions as are found in vocational high schools the controlling purpose in the secondary schools is college admission. Since such a large proportion of the youth enter high school, it is natural that the upper elementary school grades should be greatly influenced by the need of preparing pupils to enter high school. The early years of the elementary school represent, therefore, the period where there is greater freedom for experimentation in regard to subject matter. Even the pre-school period is receiving much attention. Both Wellesley and Vassar Colleges announced experimental schools for pre-school children. Already well equipped schools for such children exist at Yale, Columbia, University of Iowa, and the Merrill-Palmer School at Detroit, while the University of California had received a fund for the establishment of such a school. With colleges and universities giving serious consideration to the purposes of education in these fields, there was reason to believe that there will come about a better understanding of what schools should accomplish.

THE FEDERAL EDUCATION BILL. In his message presented at the opening of the Seventieth Congress, President Coolidge made the following statement: "For many years it has been the policy of the Federal government to encourage and foster the cause of education. Large sums of money are annually appropriated to carry on vocational training. Many millions go into agricultural schools. The general subject is under the immediate direction of a commissioner of education. While the subject is strictly a State function, it should continue to have the encouragement of the national government. I am still of the opinion that much good could be accomplished through the establishment of a Department of Education and Relief, into which would be gathered all of those functions under one directing member of the cabinet."

This renewed assurance of Presidential support gave new interest to the attempt to secure a Secretary of Education. The new bill which was introduced was known as H. R. 7. Following are the subjects of the different sections of the bill:

Section 1. Creates a Department of Education with a Secretary in the President's Cabinet.

Section 2. Authorizes an Assistant Secretary of Education and other necessary assistants.

Section 3. Provides for the transfer to the Department of Education of the Bureau of Education, the Federal Board for Vocational Education, and of such control as is now exercised over the Columbia Institution for the Deaf and Howard University.

Sections 4, 5, and 6. Defines the powers and duties of the Secretary of Education.

Section 7. Provides for a Federal conference on education consisting of one representative from each of the Executive Departments.

Section 8. Provides that the Department of Education shall conduct researches covering the whole field of education, and for the distribution of results of such researches to educational officials in the several States and to other persons interested in education.

Section 9. Provides an appropriation of \$1,500,000 annually for the support of the work of the department.

Section 10. Provides for the creation of a National Council on Education, composed of the chief school authorities of the various States, territories, and

possessions, who shall meet annually at the call of the Secretary of Education.

Section 11. Provides that the Secretary of Education shall make an annual report to congress.

Section 12. Is an enacting clause.

INTERNATIONAL EDUCATIONAL CONFERENCES. *The Locarno Conference of the New Education Fellowship.* The Fourth International Conference of the New Education Fellowship was held at Locarno, Switzerland, from August 3 to 15. More than 1100 people representing 51 countries attended; more than 200 Americans were there. The programme of the conference had as its central theme. "The True Meaning of Freedom in Education." Four institutions in the United States were represented on the programme. The Dalton method was presented by Dr. Lucy L. W. Wilson, of the South Philadelphia High School for Girls, Mrs. Marietta Johnson, founder of the Fairhope (Alabama) School of Organic Education, spoke on the subject of coeducation, Dr. Harold Rugg of the Lincoln School of Teachers College, Columbia University, spoke on the revision of curricula, and Dr. Carleton Washburne described the methods of individual instruction used in the Winnetka, Illinois, schools. The next meeting was to be held in some city in Denmark. The themes of the next conference to be held in 1929 were to be, first, freeing of the child to allow the fullest possible use of all the faculties he possesses, and second, the best kind of curriculum adapted to the needs of modern life.

THE WORLD FEDERATION OF EDUCATION ASSOCIATIONS. This Federation held its biennial meeting in Toronto, August 7 to 12. More than 5000 delegates were present. A feature of the meeting was the consideration of the reports of five committees appointed under the Herman-Jordan plan of education for international understanding. Committee No. 1 was concerned with the problem of "Education for International Understanding." Committee No. 2 gave a report on the "Teaching of History." Committee No. 3 reported on "International Relations of Youth as Expressed in Athletic Events, Physical Education, and Sports." Committee No. 4 reported on "Military Training and Military Defenses." Committee No. 5 worked on a report on "Studies of Methods and Instruments used in Settling International Disputes without Resorting to War." Each committee held open conferences during the meeting.

Mr. E. J. Samsbury, of Surrey, England, chairman of Committee No. 4, presented the report of his committee in respect to military training. As reported in *School and Society* the report "declared that military preparedness on an unrestricted scale among the nations was provocative of war feelings, and that training of students in the schools and colleges of England, the United States, and other countries tended to promote the view that disagreements among nations could be settled only by an appeal to the sword." The resolutions that were presented opposed military training in civil educational institutions. The report aroused a heated debate and the resolutions were tabled, but they were to be considered at the meeting in 1929.

The meeting adopted resolutions relating to Educational Opportunity, Adult Education, History Teaching, Geography Teaching, Educational Week, Character Education, the Behavior Problem Child, International Educational Exchange, the Removal of Illiteracy, Visual Education, and other topics.

PAN-PACIFIC EDUCATIONAL CONFERENCE. A pan-Pacific Conference on education, reclamation, and recreation met in Hawaii during June. Fifteen countries were represented. The purpose of the meeting was to create a better understanding among the Pacific countries. Secretary of the Interior Hubert Work was responsible for the organization of the meeting. Many educators from the United States attended and participated.

RURAL SCHOOL STANDARDIZATION. The United States Bureau of Education reported that thirty-one State departments of education were promoting standardization of rural schools. In some of the other states, county school officers were encouraging standardization within their own districts.

Among the important requirements for standardization of rural schools are the following:

- (1) The school site should be well drained, level, fertile, and should contain at least two acres of ground.
- (2) The school building should comply with accepted standards relating to numbers of rooms and their dimensions, color scheme for walls and ceilings, replacement of glass area of windows, heating and ventilation, and amount and kind of equipment.
- (3) The minimum scholastic preparation of the teacher should be completion of four years of high school, plus a two-year normal course and two years of successful experience.
- (4) The school term should be nine months; the average daily attendance at least 90 per cent of the enrollment and the enrollment 90 per cent of the educables of the district; there should be a well-planned daily programme, and the State course of study should be followed.

SABBATICAL LEAVE FOR PUBLIC SCHOOL TEACHERS. According to a report of the Bureau of Education, there is a large increase in the number of cities granting sabbatical leave to teachers. More than 50 per cent of cities of a population of 100,000 or more have definite plans for granting their teachers leave for professional study and improvement. The sabbatical plan is the most popular one. According to a report by the National Sabbatical Leave Association, Cleveland, 39 cities, having a population of 100,000 or more, have adopted a definite plan and 133 cities having a population of 2500 to 100,000 have also adopted plans for teachers' leave. Many cities have virtually the same regulations. The eighth year is given and the teacher is expected to return for two or three years to the same system and repay part of the money granted while he or she was on leave. The remuneration is usually one-half of the regular salary. In general not more than 1 per cent are permitted to be absent at one time.

SCHOOL SAVINGS BANKING. According to a report made by W. Espey Albig, deputy manager of the American Bankers' Association, in charge of its savings activities, nearly four million pupils participated in school savings banking and deposited almost twenty-four million dollars during the year ending June 30, 1927. Mr. Albig stated that seven years before, the Savings Bank Division of the American Bankers' Association reported 2736 schools having school savings, while on June 30, 1927, the number was 12,678. The number of pupils enrolled in schools having a school savings system had increased from 1,015,653 to 4,658,156. The number of pupils participating in school savings had increased from 462,651 to 3,815,785; while the enrollment in these schools had increased 358 per cent, the number participating in savings has grown 724 per cent.

Seven years previously the deposits amounted to \$2800 and in the year 1927 to about \$23,700,000. The net savings of that year were \$9,464,178.93 and the bank balances \$39,137,073.91.

In comparison with the previous year the number of schools increased 11.4 per cent; the number of pupils enrolled in schools having a savings system 7.8 per cent; the number participating 12.1 per cent; the deposits 15.7 per cent; and the net savings 7.9 per cent.

See **UNIVERSITIES AND COLLEGES**, and sections on *Education* in articles on various states and countries.

EGERTON, ɛj'ər-ton, HUGH EDWARD. British historian, died at Oxford, May 21. He was born Apr. 19, 1855, and was educated at Rugby and at Corpus Christi College, Oxford. He became assistant private secretary to the Rt. Hon. Edward Stanhope, M.P. When the latter was appointed to the Colonial Office in 1886 Egerton went with him and was made a member of the managing committee of the Emigrants Information Office, where he was active until 1906. In 1905 he became Beit professor of colonial history at Oxford and fellow of All Souls College, holding the chair until 1920. His work in the colonial office involved the preparation of a concise and accurate handbook on the British colonies, and this led him to devote himself to their early history and subsequent developments. In 1897 he published *A Short History of British Colonial Policy*, a sixth edition of which appeared in 1920; and in 1900 a short biography of *Sir Stamford Raffles*. In 1902 appeared *Origin and Growth of the English Colonies*, which attained a third edition in 1920. After he had entered upon his professorship in 1905 he published a number of works on colonial history, including: (with Prof. W. L. Grant) *Canadian Constitutional Development* (1907); *Federations and Unions Within the British Empire* (1911); and *British Foreign Policy in Europe* (1917). After his retirement from his chair he wrote: *Causes and Character of the American Revolution* (1923), a book which established his reputation on both sides of the Atlantic as a keen, impartial and discriminating historical scholar. Professor Egerton contributed to many of the more important works of reference and also edited several important collections, including *Sir W. Molesworth's Speeches* (1903), and *The Royal Commission on Loyalists' Claims, 1783-85* (1915).

EGGS. See **LIVESTOCK**.

EGYPT. A kingdom in northeastern Africa, governed by a king since Mar. 15, 1922, after the termination of the British protectorate declared Dec. 18, 1914; occupying the valley of the Nile, the Libyan desert, the region between the Nile and the Red Sea and the Sinai peninsula; claiming jurisdiction also over the Sudan, which claim, however, is denied by the British. Capital, Cairo.

AREA AND POPULATION. The total area of Egypt proper which is described above is about 383,000 square miles. This figure does not include the Sudan. The cultivated and settled area, comprising the Nile valley and delta, is only 12,023 square miles. The last census of the settled area, taken on Feb. 18-19, 1927, gave the total population at 14,168,756 as compared with 12,750,918 at the census of March, 1917. The chief cities with their populations at the census of 1917 were: Cairo, 790,939; Alexandria, 444,

617; Port Said (including Ismailia), 91,090; Suez, 30,996; Tanta, 74,195; Mansura, 49,238; Asyut, 51,431; Damanhur, 47,867; Fayum, 44,000. In the same year the population was distributed among the various religions as follows: Mohammedans, 11,658,148; Greek Orthodox, 854,778; Roman Catholic, 107,687; Jews, 59,581; Protestants, 47,481. The movement of population in 1924 was: Births, 604,410; deaths, 343,515.

EDUCATION. Elementary education is supplied by native schools called *Maktabs*. In 1925-26 the number of these receiving grants-in-aid and under government inspection was 2762, with 5220 teachers and a total attendance of 202,795, while those under the immediate direction of the government in 1926 was 337, with a total attendance of 40,531. In addition there are higher elementary and higher primary schools, a few schools for technical and special training, and higher colleges of law, engineering, military science, veterinary science, agriculture, pedagogy, commerce and accounting, and medicine. The total number of schools under the control of the provincial councils in 1926 was 3575 with 286,681 pupils. The centre of Moslem culture is the mosque and university of El-Azhar at Cairo.

PRODUCTION. World overproduction of cotton, which resulted in lower prices for this staple, coupled with industrial depression in certain countries which are normally the largest consumers of Egyptian cotton, subjected Egypt's economic position to a severe test. The actual loss in the value of raw cotton exported during the 1925-26 cotton year, as compared with the previous year, was £17,355,000 (the Egyptian pound equals approximately \$5). The Egyptian government extended aid during the 1925-26 season by purchasing large quantities of cotton and storing it; but as these stocks merely swelled the abnormal supplies on hand at the end of the season, the same policy was not followed in the 1926-27 season. Instead the government placed large sums of money at the disposal of the banks in order to supply the farmers with loans on the cotton stored in the banks' warehouses. The final official estimate placed the 1926 cotton crop at 1,497,000 bales averaging 478 pounds net. The sugar industry, which ranks after cotton in importance, was also affected by the large world crop. The sugar crop in Egypt rose from 845,000 tons in 1925 to 968,000 tons in 1926, but the total return on sales showed a contrary result for these periods, the crop of 1925 having been sold for approximately £2,325,400 and that of 1926 for £1,913,000.

The sugar situation in Egypt was improved somewhat by the remission of the export duty and, with the government curtailment of the Cuban crop, the outlook for the industry was more promising.

The project for the Gebel Awlia Dam was abandoned during the fiscal year 1925-26, thus delaying the realization of the irrigation programme and the cultivation of new land. To offset this it was proposed again to raise the Assuan Dam, this time by an additional 20 feet; this will double its present height and double the capacity of the artificial lake, which now stores 2,500,000,000 cubic meters of water. The plan would involve an expenditure of approximately \$15,000,000. A scheme to increase the Nile water supply for irrigation, actually

under consideration by the Egyptian government, is the draining of the Sudd. Preliminary work on this project was under way in 1927, for which £E200,000 was appropriated. The work is expected to require 15 years to complete, with annual appropriations of £E200,000. Both these projects, however, encountered some opposition.

In 1925 the area and yield of wheat were 1,379,626 acres and 984,363 tons; barley, 366,437 acres and 242,635 tons; beans, 462,921 acres and 307,335 tons; lentils, 68,817 acres and 41,413 tons; onions, 40,609 acres and 259,887 tons; maize, 2,076,342 acres; millet, 222,468 acres; rice, 142,716 acres; sugar-cane, 53,308 acres. In the same year there were in Egypt 34,017 horses, 709,789 donkeys, 21,480 mules, 676,994 cattle, 722,943 buffaloes, 1,091,016 sheep, 455,054 goats, and 159,345 camels. The principal mineral products in 1925 were in metric tons: Phosphate rock, 106,808; petroleum, 179,651; and manganese iron ore, 80,589. Other products are nitrate shale, carbonates and sulphate of soda, ochres, sulphate of magnesia, talc, building stones, clay, gypsum, natron, nitrate of soda, salt, and turquoise. Manufacturing in Egypt is still in its infancy, but indications point to systematic and more rapid development in the next decade. Although the cigarette industry is one of the most important in the country, no tobacco is raised in Egypt, but \$7,000,000 worth is imported annually.

COMMERCE. For the first time in five years, the trade balance was unfavorable in 1926—a result that is accounted for by the slump in world cotton prices and the consequent returns on Egypt's leading export commodity.

EGYPT'S FOREIGN TRADE DURING 1926
[000 omitted]

Commodity	1925	1926
IMPORTS		
Yarns and textiles	£E17,966	£E18,631
Metals and metal ware	8,472	8,762
Cereals, flour, and agricultural products	7,101	5,952
Wood and coal	4,840	4,355
Chemical and medicinal products and perfumery	4,205	8,791
Spirits, beverages, and oils	3,558	3,803
Colonial produce and general groceries	3,168	2,935
Animals and animal food products	1,868	1,802
Other animal products	66	54
Stone, earthenware, and glassware	1,638	1,499
Tobacco, tumbak, and cigars	1,473	1,352
Paper and printed matter	1,032	1,027
Hides, skins, and leather goods ..	663	674
Dyestuffs and colors	398	380
Miscellaneous	1,777	1,888
Total	58,225	52,400
EXPORTS		
Yarns and textiles	52,025	34,670
Cereals, flour, and agricultural products	4,795	4,077
Animals and animal food products	527	325
Spirits, beverages, and oils	394	756
Cigarettes	383	355
Hides, skins, and leather goods ..	248	325
Metals and metal ware	225	743
Colonial produce and general groceries	204	94
All others	398	414
Total	59,199	41,759
Reexports	1,270	1,371
Grand total	60,469	43,130

The most significant loss in Egypt's imports during 1926 occurred in yarns and textiles. This was a natural sequel to the cotton-price crisis,

under which the importers experienced difficulty in meeting payments for their earlier commitments. Imports of cereals and agricultural products recorded another important reduction, represented in a decrease of approximately 40,000 tons from Australia, which normally supplies the bulk of the cereals. The United Kingdom was the chief source of imports during 1926, supplying 21.8 per cent of the total. France was the next important source, with 10.8 per cent, followed by Italy with 8.7 per cent. Egyptian exports to foreign countries, exclusive of raw cotton, were generally maintained. The actual loss in the value of raw cotton exported during 1926 was £E17,355,000, and the net loss in all categories after deducting the gains totaled £E17,440,000. Imports from the United States during 1926 amounted to \$12,371,000 as compared with \$10,581,000 in 1925. Egyptian exports to the United States were valued at \$27,921,000, as compared with \$42,056,000 in 1925. This reduction is accounted for almost entirely by the drop in price of cotton.

FINANCE. The financial position of the country during 1926 was strong despite the unfavorable developments in trade circles following the slump in cotton prices. The government reserve fund at the end of December, 1926, was £E31,000,000. While a draft of £E437,000 on this reserve fund was contemplated in order to balance the 1926-27 budget, actual receipts were considerably below estimates, so that a deficit of approximately £E2,000,000 was indicated. Customs receipts alone showed a drop of more than £E900,000. The state budget for the fiscal year 1927-28 showed estimated receipts and expenditures of £E38,677,000, or £E683,000 less than for the previous fiscal year. Receipts include the withdrawal of £E2,454,000, from the reserve fund, and estimated customs dues were lowered to £E11,003,000 from £E12,342,000. Reductions in expenditures were carefully spread over the entire budget. The appropriation for the ministry of foreign affairs was dropped from £E421,000 to £E236,000, entailing an expected reduction in the number of consuls and diplomatic representatives maintained abroad. The £E1,500,000 made available for new works in the department of irrigation was slightly less than that appropriated during the previous year. Railroads got £E6,494,000 as compared with £E7,018,000 in 1926-27. A bill was approved by the council of ministers proposing that the fiscal year begin on June 1, 1927, instead of April 1 as heretofore, and that the intervening months of April and May be added to the financial year 1926-27.

COMMUNICATIONS. Exclusive of sailing vessels, 3287 ships entered Egyptian ports during 1926, this being 50 vessels less than in 1925. A total of 4,157,000 tons of cargo was landed as compared with 4,496,000 in 1925. Departures show a corresponding decrease in the number of vessels leaving Egyptian ports, and cargo shipped out in 1926 declined to 1,316,000 tons from 1,425,000 tons in 1925.

With the change from narrow to standard gauge on the southern line of the Egyptian Government Railways, from Luxor to Shellal, 135 miles, the entire system of 2050 miles was made standard gauge and the time from Cairo to Shellal, 550 miles, was reduced by four hours. The Luxor-Shellal line was built originally as a military railway of 3½-ft. gauge and was 160

miles long. The new work included strengthening bridges and reballasting tracks. All this work was done by railway forces in about ten months at a cost of about \$1,300,000 and without interrupting traffic on the narrow-gauge line.

GOVERNMENT. According to the constitution promulgated Apr. 10, 1923, Egypt was proclaimed a sovereign state under a hereditary monarch, with representative government. Equal rights, irrespective of race, language, or religion, were guaranteed, as was the liberty of the individual and religious belief. Executive power was vested in the king, who also exercises legislative power in concurrence with the legislature. The latter was to consist of a senate and a chamber of deputies, the senate to be composed of three-fifths elected by universal suffrage and two-fifths appointed by the king (the term of office is 10 years; one-half is renewed every five years); and the chamber of deputies to consist of members elected by universal suffrage for five years. The king can dissolve the chamber of deputies to which the ministers are jointly and separately responsible. Mohammedanism is the state religion and Arabic the official language. The king in 1927 was Fuad I, who acceded Mar. 15, 1922.

HISTORY

RESIGNATION OF THE CABINET. As noted in the previous YEAR BOOK a change had taken place in the Egyptian cabinet in June, 1926, largely as a result of the elections. The pro-British cabinet of Ziwar Pasha gave way to one headed by Adly Pasha. The natural leader of the Egyptian Nationalist group, Zaghlul Pasha, was not permitted to form a government because of his well known and often expressed hatred of Great Britain. Adly Pasha's first few months as the head of the government were fairly tranquil, but as time went on his position became more and more difficult because of conflicts with parliament and Adly, apparently, was very glad to resign on Apr. 18, 1927, when a minor matter of finance was decided against him. Once again, it seemed as though Zaghlul Pasha would be called upon to form a ministry, but once again British influences prevented his selection, although ill health was given as the public reason for his failure to accept office. Largely as a result of his work, however, a ministry was formed under the leadership of Sarwat Pasha, who was promised more co-operation in parliament than Adly Pasha had been able to command. The cabinet as reorganized was composed as follows: Prime Minister and Minister of Interior, Abdel Khalek Pasha Sarwat; Agriculture, Fathallah Pasha Barakat; Foreign Affairs, Morcos Pasha Hanna; Public Works, Osman Pasha Moharram; Wakis, Negib Pasha Gharably; Finance, Ali Pasha Shamsy; Justice, Zaki Pasha Abdul Soud; Education, Mohammed Pasha Mahmud; Communications, Ahmed Pasha Khashaba.

Sarwat's experiences with Parliament were not much happier than those of Adly. Less than three weeks after his installation he came into conflict with the Nationalist element over a matter of appointment of mayors of towns and villages. The Parliament was anxious to have them elected instead of appointed by the government. Parliamentary leaders requested that Sarwat reinstate a certain mayor who had been dismissed and the prime minister took the

stand that it was an unwarranted interference on the part of the legislative branch of the government with the executive branch and took immediate steps to resign. Zaghlul Pasha, however, stepped into the breach and mollified the premier to such an extent that he determined to continue in office. The course of the ship of state only ran smoothly for a short time, when another and more serious crisis occurred, this time over relations with Great Britain.

THE BRITISH NOTE. The Egyptian Parliament made a proposal to increase the size of the Egyptian army and to place the control of it in the hands of the Egyptian government rather than in the hands of the British Sirdar. On May 30, the British government addressed a note to the Egyptian government on the subject of army administration in Egypt. The note, which was fairly moderate in tone, although concomitantly with it warships were sent to Alexandria and Port Said, aimed at the elucidation of some serious misunderstandings which had arisen in regard to the Egyptian army during the last few years.

The immediate occasion of the note was the decision of a committee of the Egyptian parliament to recommend the suppression of credits for the Sirdar. Until the murder of Sir Lee Stack in 1924 (see YEAR BOOK for 1924), the Egyptian army was under the command and the recognized control of a British Sirdar. No one was appointed to succeed Sir Lee Stack, although his work was taken over by an acting Sirdar. The acting Sirdar was never recognized by the Egyptian government, and his powers and authority had been steadily undermined by a series of administrative acts carried out by the successive Egyptian Ministries of War. The effect of these acts was a gradual diminution of British control over the Egyptian army, the reinstatement in important positions of officers who on critical occasions had taken a political part in opposition to Great Britain, and also an increase in the numbers and equipment of the army.

Although the contents of the British note were not published, it was stated that the special interests of the United Kingdom in the Egyptian army were emphasized, and the Egyptian government was requested to put forward proposals as to how the necessary British co-operation in the military affairs of the country might be most effectively secured. Upon the deliverance of the note the premier visited Zaghlul Pasha and consulted with him concerning its contents and the question of its answer. The Egyptian answer as finally delivered was in the form of a compromise and temporary agreement to maintain the status quo in the army and in the frontier's administration, at the same time safeguarding the authority and responsibility of the Ministry in these matters. The press drew the conclusion that while Great Britain was to remain in control of the army, it was to be enlarged in accordance with the wishes of the Egyptian parliament. Possibly as an aftermath to this exchange of notes King Fuad and Prime Minister Sarwat visited London early in July and were entertained by the British King and Queen. A serious loss to the Egyptian cause, particularly in the development of the Nationalist movement, was the death of Zaghlul Pasha (q.v.), the main spring and fountain head of the independence movement in

Egypt. Many observers believed that with his passing, the hope of an independent Egypt, unchained to the political and economic ambitions of Great Britain, passed also. His place as leader of the Nationalist group was taken by Pasha Nahas, who announced that Zaghlul's policies would be carried on unchanged. See **ARCHAEOLOGY**.

EGYPTIAN EXPLORATION FUND. See **ARCHAEOLOGY**.

EICKEMEYER, CARL. American engineer, inventor and author, died at Brooklyn, N. Y., December 2. He was born at Yonkers, N. Y., Jan. 14, 1869, and studied at Cornell University, graduating as a mechanical engineer. His father, Rudolf Eickemeyer, invented the first rotary field alternating current motor, and made other inventions. The younger Eickemeyer began his professional career as superintendent of installation for the New York City Electrical R. R., the Lynchburg, Va., Electrical R. R., and other lines. Later he engaged in manufacturing, and in 1900 opened an office as an electrical engineer and devoted his time to designing and patenting automatic electrical pumps, gas radiators and other devices. He was the inventor of a single-weight disappearing gun carriage, an improved steel cross-tie, a shockless rail joint to eliminate vibration in railroad cars, a high-speed electric locomotive and a high-speed third rail. From 1918 to 1920 he served in the United States Army Officers' Reserve Corps. Mr. Eickemeyer traveled extensively among the Indians of the southwestern part of the United States, and conducted scientific expeditions in that region. He was the author of: *Over the Great Navajo Trail; Among the Pueblo Indians; The History of the Apache; Cinderella; The Giant Killer; The Trails of a Mormon; The Articles of Confederation for the Consolidation of the Peoples of the American Continent*, and *The Centre of the Universe*, an astronomical work.

EIGENMANN, CARL H. American zoologist, died at San Diego, Cal., April 24. He was born at Flehingen, Germany, in 1863, and, going to the United States, was educated at the University of Indiana, graduating in 1886; he received the degree of Ph.D. in 1889. In 1891 he became professor of zoology at the University of Indiana, and in 1908 was elected dean of the graduate school. From 1909 to 1918 he served as curator of fishes at the Carnegie Museum, Pittsburgh, Pa., and he founded the biological station of the University of Indiana, serving as its director, 1895-1920. He was elected a member of the National Academy of Sciences, and was identified with many learned societies in the fields of natural sciences and exploration. He explored extensively in the western United States and Canada and in Cuba, British Guiana, Peru, Bolivia and Chile, and wrote many reports and monographs on subjects in natural science, especially fishes. He was an authority on the cave vertebrates of North America, about which he wrote extensively. His other writings include: *The Archipelago-Archipelenic Theory; The American Characidae; The Freshwater Fishes of British Guiana; The Fishes of Western South America; and The Doradidae*.

EINSTEIN THEORY. See **PHYSICS; RELATIVITY**.

EINTHOVEN, WILLIAM. Dutch physiologist and recipient of the Nobel prize for medicine

for 1924, died at Leyden, September 28. He was born at Samarang, Java, May 21, 1860, and was educated at Utrecht and at the university there, being a scholar of Donders, Koster and Snellen. He was made assistant of Donders and Snellen in 1879. He became doctor of medicine in 1885, and in 1886 was made professor of physiology at the University of Leyden, holding the chair at the time of his death. In 1924 Dr. Einthoven visited the United States, opening the Dunham lectures in Boston, and it was there that he heard of the award to him of the Nobel prize for "his discovery of the mechanism of the electro-cardiogram." He was the inventor of a special galvanometer used in connection with heart studies. In 1926 he was elected a foreign member of the Royal Society, and he received the degree of LL.D. from Aberdeen University. His experimental work did much to promote a better understanding of diseases of the heart through the observation and interpretation of clinical phenomena, and his apparatus soon found uses in the more important hospitals and the clinics of heart specialists. He wrote extensively for scientific journals, preparing a chapter in Heyman's *Handbuch der Laryngologie und Rhinologie*, and one in Bethe's *Handbuch der Normalen und Pathologischen Physiologie*. His work covered the fields of physics, physiology and medicine, and apparatus designed by him were marvels of delicacy and precision.

ELECTRICAL ENGINEERS, AMERICAN INSTITUTE OF. A national organization representing the electrical engineering profession, founded in 1884. The objects of the Institute are the advancement of the theory and practice of electrical engineering and of the allied arts and sciences, the maintenance of a high professional standing among its members, and the development of the individual engineer. It is governed by a board of directors, elected by the membership, consisting of a president, the two junior past presidents, 10 vice presidents, 12 managers, and a treasurer. In 1927 there were 52 sections of the Institute located in various cities throughout the country and 95 branches in colleges giving courses in electrical engineering. Three annual conventions are held, in addition to regional meetings and local section and branch meetings. Much of the Institute's work is accomplished through its standing and technical committees, of which there were 36 in 1927. It maintains, in coöperation with other national engineering societies, the Engineering Societies Library and a national employment service. There are three grades of members, as follows: associate, member, and fellow; and the total membership on Oct. 1, 1927, was 18,701. The annual award of the Edison Medal, founded by associates and friends of Thomas A. Edison, went to Dr. William D. Coolidge of the General Electric Co., "for his contributions to the incandescent electric lighting and the X-ray arts."

The principal publications of the Institute are the monthly *Journal*, the annual *Transactions*, the *Standards of the A.I.E.E.*, and the *Year Book*. The officers elected for 1927-28 were: President, Bancroft Gherardi; junior past presidents, C. C. Chesney, and M. I. Pupin; vice presidents, H. M. Hobart, George L. Knight, B. G. Jamieson, H. H. Schoolfield, A. E. Bettis, O. J. Ferguson, E. R. Northmore, J. L. Beaver, A. B. Cooper, C. O. Bickelhaupt; managers, John B. Whitehead, J. M. Bryant, E. B. Merriam,

M. M. Fowler, H. A. Kidder, E. C. Stone, I. E. Moulthrop, H. C. Don Carlos, F. J. Chesterman, F. C. Hanker, E. B. Meyer, and H. P. Laversidge; national treasurer, George A. Hamilton; national secretary, F. L. Hutchinson. The Institute's national headquarters are in the Engineering Societies Building, 33 West 39th Street, New York, of which it is joint owner with three other national engineering societies.

ELECTRICAL INDUSTRIES. Increasing employment of electrical energy in manufacturing processes was an outstanding feature of the year. Steel works, cement mills, welding, heat-treating of metals, improved electric furnaces, etc., marked American industrial progress. The new Homestead Steel mills, near Pittsburgh, Pa., had electric equipment aggregating 54,000 h.p. in 11 units, ranging from 1500 kw. motor-generator sets up to 7000 h.p. reversing-mill motors. The largest electric oven ever built was put in service for enameling stove parts. It had two chambers 125 ft. long and was arranged to have a high-temperature zone 20 ft., 8 in. long in the centre. Electric heat was employed in an ingenious water-proof device for melting snow and ice in and around switches in railroad tracks and was reported to be highly satisfactory. In a large brass plant it was found that an electric oven saved much material that formerly was ruined by excessive or deficient heating. Heat-treating, tempering, etc., of steel parts large and small, was very widely employed, as it was said better control of temperature could thus be obtained than by any other means. European industrial establishments also were installing electric power in many large plants.

There was considerable increase, too, in the employment of electric furnaces in the brass industry, mostly in small sizes, of a capacity up to 200 to 300 kv-a. Three-phase arc furnaces, for some time in use in steel foundries, were in certain mills superseded by the coreless-type induction furnace, known as the "high-frequency" furnace for the production of special high-grade alloy steels.

ELECTRIC LIGHTING. The year was noteworthy in respect of sales of incandescent lamps, the largest amount in the history of the United States. An authoritative estimate of the volume of such sales fixed the total at 320,000,000 large and 218,000,000 miniature lamps; the former showing an increase of 8,000,000 (about 2½ per cent) and the latter an increase of 16,000,000 (about 8 per cent) over sales during 1926. For the illumination of aviation fields and other large spaces, 10-kw. Mazda lamps were developed; but, owing to the intense heat of such units, some trouble was experienced by reason of the deterioration of the basing cement. This was overcome by the aid of a new clamp base, mechanically secured to the lamp.

Improved Mazda lamps of 100 watts were brought out for moving picture projection having a filament coiled to much smaller dimensions than in former types, thus giving a smaller area to the light source and thereby intensifying the sharpness of focus on the screen. For aviation beacons a new type of neon quartz tube lamp was developed and put in use that possessed the advantage of operation on a low-voltage circuit, as it had a hot cathode in the tube that gave sufficient electron emission to supply current for the luminous discharge. This lamp was made of a quartz tube 1½-inch in

diameter, and, as almost all of its visible radiation was within the long wave-lengths, it was especially valuable by reason of its visibility through fog, aviators having reported having seen its orange-red glow on clear nights at a distance of 75 miles. It was reported to have very long life, one such lamp having been tested for 3000 hours without showing any signs of deterioration.

A great increase in display and sign illumination was noticeable during the year. The tower of the Paramount Theatre in New York City was illuminated nightly by 473 floodlights, giving a very brilliant effect and incidentally involving a total load of 15,000 kw. Illumination of the Holland vehicular tunnel under the Hudson River between New York City and Jersey City was effected by the installation of 150-watt, 115-volt, clear-bulb lamps spaced 20 ft. apart through the tunnel and set with reflectors in the white-tiled walls, giving an excellent diffusion of light.

ELECTRIC POWER TRANSMISSION. The super-power system under discussion for some years past was beginning to take shape in the New England and Middle States, as well as to a considerable extent in the Middle West. This was in process of accomplishment through the construction of mammoth generating stations, distributing their output over large areas, and by the interconnection of their lines with those of other similar plants for the purpose of exchanging electricity with them and thus reaching a constantly increasing number of consumers, who were thereby supplied more reliably and economically than ever before. Combination steam and hydro-electric stations were becoming increasingly numerous and a better balanced load was obtained for all stations interconnected.

To take care of the augmented output of large generators and to keep pace with the sudden demands for power characteristic of modern systems of distribution, transformers of unusual capacity and ruggedness were designed and built, with especial reference to the dissipation of the large amount of heat generated in operation. What was reported to be the largest single-phase transformer ever built was put in service by the Philadelphia Electric Co. during the year. It was rated at 33,333 kv-a, with an ultimate rating of 50,000 kv-a. For cooling purposes, a motor-operated blower directing a strong blast of air against the radiators that were an integral part of this transformer dissipated the heat and prevented undue temperature rise of the oil insulation. Oil switches and circuit breakers were developed and installed in sturdier and more reliable design to take care of the enormous quantities of energy due to short circuits and lightning discharges.

There were notable improvements in the design and manufacture of high-tension underground cables for power transmission. In Chicago, the Commonwealth Edison Co. put in service a six-mile line (18 cable miles) of 132-kv., single-conductor, oil-filled cable. In New York City, the Edison-United companies installed a 12-mile (36 cable miles) cable of the same capacity. Before making service connections, these cables were tested up to 300,000 volts without showing any defects. Being designed for a 91,000 kv-a load, they could accommodate the output of the largest generators in use. A fea-

ture of their construction was the employment of an oil-filled core, the oil being kept under pressure so as to allow for contraction and expansion at the joints due to temperature changes. For use in grounding high-tension power systems, very large current-limiting reactors were built. One of these, for use at Baltimore, Md., connected to a 13,200-volt, 25-cycle system, had a 4-minute rating of 80,000 kv-a, 10,000 amperes and weighed 8 tons. Much valuable information concerning lightning discharges was obtained with the aid of the newly-developed cathode-ray oscillograph, by means of which the behavior of various types of arresters under service conditions could be studied and the effects of high-tension surges on transmission lines more readily investigated.

ENCEPHALITIS, EPIDEMIC. Kreuser and Weidner (*Deutsche medizinische Wochenschrift*, Sept. 9, 1927) pointed out that this affection was undergoing marked changes in type with the march of years, although its existence had only been recognized since 1916. Originally the patients were attacked suddenly and violently with a cerebral affection which manifested itself largely in symptoms referable to the cranial nerves. Now, judging by the cases seen in 1926, the onset in place of being sudden and violent is gradual and insidious and the manifestations are chiefly spinal; in short, the morbid process appears to be descending from the brain to the spinal cord. In many cases a condition hardly distinguishable from influenza seems to have preceded the evolution of the disease. The most striking symptoms have to do with the heart and vasomotor system, the patients suffering from severe palpitation and fear of death with sweating, salivation, cold and livid hands and feet and certain alterations of personality, such as neurasthenia, hypochondria and various psychopathic manifestations. As depicted by the authors it is difficult to understand how some of these cases could have been recognized as encephalitis at all, although it is likely that the authors confined their description to the more atypical symptoms, omitting those on which the diagnosis was based.

Over 10 years' experience with this new malady has shown that it cannot be reached by any form of drug treatment including the use of serums and nonspecific protein treatment. At least this was the conclusion reached at the psychiatric and neurologic clinic of the University of Breslau, as related by Dr. G. Winkler in the *Klinische Wochenschrift* for Aug. 6, 1927. The treatment must therefore be entirely symptomatic including attempts to minimize the damage effected by the disease. There are three resources available; namely, a movement cure to develop the functions of new nerve centres and paths; orthopedic correction of certain motor anomalies, and finally mental therapy. These measures may be used jointly, although each form has its own special uses. Certain troublesome symptoms due to a spasmodic condition of muscles have been controlled by proper supporting and retentive apparatus. The course

of muscular exercises does not differ in the main from those in use for other chronic nervous affections, such as locomotor ataxia, but must be strictly individualized for each patient. Psychic treatment, which may be carried out in different forms, is useful to overcome the peculiar lack of initiative, the apathy and mental depression. Naturally the other forms of treatment, even comprising drugs, may exert a secondary suggestive action.

ENGLAND. The term in its strictest sense applies to the largest and most densely populated part of the island of Great Britain. As employed in reference to the government it often indicates the United Kingdom and Ireland. See GREAT BRITAIN.

ENGLAND, CHURCH OF. The established church of England. Its faith is represented in the United States by the Protestant Episcopal Church (q.v.). The King is the supreme governor of the church, possessing the right to nominate to vacant archbishoprics and bishoprics. The King and the First Lord of the Treasury also appoint to certain deaneries, prebendaries, and canonries, and the Lord Chancellor to certain canonries. For administrative purposes the country is divided into two provinces: the Convocation of Canterbury and the Convocation of York, each under the control of an archbishop. The Church Assembly, established in 1920 "to deliberate on all matters concerning the Church of England and to make provision in respect thereof," consists of three Houses, composed of bishops, clergy, and laity respectively, the laity being elected every five years by the lay members of the Diocesan Conferences, which consist of representatives elected by members of the church. Every measure passed by the Church Assembly must be submitted to an Ecclesiastical Committee, consisting of 15 members of the House of Lords and 15 members of the House of Commons. This Committee reports on each measure to Parliament, and the measure becomes a law if it is passed by both Houses of Parliament. Parochial affairs are managed by the lay members of the Diocesan Conferences.

The outstanding event of the year under review was the passage of the Revised Prayer Book Measure through the Church Assembly, its subsequent approval by the House of Lords and its rejection by the House of Commons. The final revision of the book occupied the House of Bishops from January 12 to 22 and again from March 2 to 5. Before the revision was finally completed the book was informally communicated by the bishops in a provisional form to the Lower Houses of Convocation of Canterbury and York to give them an opportunity of making further suggestions. The book in its final form was again submitted to the two convocations in accordance with the standing orders of the Assembly, sitting together on March 30. Consent was given by the convocations to the

measure being laid before the Assembly for final approval, and this stage was reached at the summer session, the debate occupying two whole days, July 5 and 6. Final approval was moved by the Archbishop of Canterbury and carried by 517 votes to 133. The measure was then submitted to Parliament; the debate in the House of Lords on the motion that the measure be presented to His Majesty for royal assent took place on December 12, 13, and 14, and was carried by 241 to 88. In the House of Commons the motion was moved on December 15 and was rejected by 238 votes to 205.

In addition to the work carried out in connection with the Revised Prayer Book, many important matters were dealt with by the Church Assembly which met for three sessions in February, July and November, including: The Ecclesiastical Commissioners Measure, which makes further provision by additional stipends or otherwise for the unbeneficed clergy from the Common Fund of the Ecclesiastical Commissioners; Sale of Parsonages Measure; and the Representation of the Laity Measure. Two reports, of the Cathedrals Commission and the Special Clergy Commission, were also made to the Church Assembly during 1927, and the following measures received the royal assent: Indian Church Measure, 1927, which provides for the Church of England in India becoming a voluntary association; the Clergy Pensions Measure, 1927; and the New Dioceses Measure. The Convocations of Canterbury and York, which met in February and March, were devoted entirely to the Revised Prayer Book.

Among the principal church events of the year were: An Order in Council constituting the new dioceses of Portsmouth and Guildford on May 1, and the new diocese of Derby on July 7; the consecration of Canon R. G. Parsons, D.D., as first Suffragan Bishop of Middleton, in York Minster, by the Archbishop of York, on January 25, and the consecration of the Rev. G. J. Walsh as Bishop of Hokkaido and Dr. G. A. Chambers as Bishop of the new diocese of Tanganyika, in Canterbury Cathedral, by the Archbishop of Canterbury on November 1; a Church Congress which took place at Ipswich from October 3 to 7, at which the general subject was "The Kingdom of God in a Country Diocese," and the 14th Conference of Modern Churchmen at Birmingham from August 22 to 29, at which the subject was "The Modern Movement in the Church of England."

The following were among the chief church appointments in 1927: The Venerable C. M. Blagden, Archdeacon of Coventry and Rector of Rugby, as Bishop of Peterborough in place of Dr. C. C. B. Bardsley translated to the new see of Leicester; the Rev. D. W. Bentley, D.D., assistant Bishop of Jamaica, as Bishop of Barbados, in place of Bishop Berkeley who resigned; the Rt. Rev. J. H. Greig, Bishop of Gibraltar, as first Bishop of the new Diocese of Guildford; the Venerable E. N. Lovett, O.B.E., Archdeacon and Vicar of Portsmouth, as first Bishop of the new Diocese of Portsmouth; the Rt. Rev. H. E. Bilbrough, D.D., Bishop Suffragan of Dover, as Bishop of Newcastle; Canon F. C. N. Hicks, D.D., Vicar of Brighton, as Bishop of Gibraltar; the Rev. R. E. Ramsay, M.A., as Suffragan Bishop of Malmesbury; the Rev. B. C. Roberts, M.A., as Bishop of Singapore; the

Rev. E. C. Pearce, as first Bishop of the new Diocese of Derby; the Venerable J. C. Macmillan, as Bishop Suffragan of Dover; and the Rt. Rev. H. Gresford Jones, D.D., as Suffragan Bishop of Warrington.

At the July session Lord Grey, Chairman of the Central Board of Finance, presented the Church Assembly Budget for 1928. It amounted to £148,241, the chief items being £32,000 for religious education; £25,000 for training new candidates for the ministry; and £50,000 for the clergy pensions scheme. The contributions to the 1927 budget from all sources up to the middle of December amounted to £64,784 and 19s. The sums contributed by the dioceses were slightly below the level of the previous year, partly due to the fact that those situated in industrial districts had felt the effects of the prolonged labor disputes of the previous year. The majority of the missionary societies benefited financially from the response made to the World Call.

Officers of the Assembly for the year were: Chairman, the Archbishop of Canterbury; vice chairman, the Archbishop of York; treasurer, Col. Sir R. Williams, Bart; secretary, Sir Philip W. Baker-Wilbraham, Bart.; chairman of the House of Bishops, the Archbishop of Canterbury; chairman of the House of Clergy, the Dean of Westminster; chairman of the House of Laity, the Earl of Selborne, K.G. Headquarters are at 8, Dean's Yard, Westminster, S.W. 1, London.

NECROLOGY. Among the well-known churchmen whose deaths were reported were: the Rt. Rev. C. R. Scott, formerly Bishop in North China; the Rt. Rev. C. J. Ridgeway, D.D., formerly Bishop of Chichester; Dr. J. W. Willink, Dean of Norwich; and the Very Rev. A. E. Burn, D.D., Dean of Salisbury.

ENGLISH, JOHN MAHAN. American theologian, died at Newton Center, Mass., May 17. He was born at Tullytown, Pa., Oct. 20, 1845, and graduated from Brown University in 1870 and Newton Theological Institution in 1875. He was ordained to the Baptist ministry in the same year. Previous to studying theology he had taught the classics in Suffield Academy, Suffield, Conn., and at Denison University, Granville, Ohio. His first pastorate was at Gloucester, Mass., where he was at the First Church from 1875 to 1882, going thence to the Dudley Street Church in Boston. He was professor of homiletics and pastoral duties in the Newton Theological Institution from 1882 to 1918, when he became professor emeritus. He was lecturer on homiletics at Andover Theological Seminary, 1895-96, and the Hartford Theological Seminary, 1922-23. He was a trustee of Brown University and president of the Northern Baptist Educational Society, 1903-08. His published works include: *For Pulpit and Platform*; *The Minister and His Ministry*.

ENTOMOLOGY, ECONOMIC. The year 1927 was notable in the United States in the field of economic entomology for the inauguration of a campaign against the European corn borer with an appropriation of \$10,000,000 by Congress. This pest having devastated the cornfields of Ontario was spreading into the great corn belt of the United States and threatened disaster to a \$2,000,000,000 industry. Second perhaps in importance was the appearance of the Mexican fruit fly in the citrus orchards of the

TYPICAL INJURY BY THE EUROPEAN CORN BORER TO STALKS OF CORN. THE FIRST GENERATION OF THE PUPÆ ARE SHOWN IN POSITION

CLOSE VIEW OF HILL OF CORN RUINED BY THE EUROPEAN CORN BORER. THE STALKS ARE SECTIONED TO SHOW THE EXTENSIVE DAMAGE WITHIN

THE EUROPEAN CORN BORER

lower Rio Grande Valley in Texas, and its threatened menace to citrus and all tree fruits in the United States. Another noteworthy event was the retirement of Dr. Leland Ossian Howard as Chief of the Federal Bureau of Entomology, after a service of 50 years with the Bureau, during the last 33 of which he had served as its chief. Dr. Howard was succeeded by Dr. Charles L. Marlatt, whose service with the Bureau for 40 years had included 33 as assistant or associate chief, and who had served as chairman of the Federal Horticultural Board since its organization, having been instrumental in the passage of the Plant Quarantine Act of 1912.

THE EUROPEAN CORN BORER CONTROL CAMPAIGN. The destruction of the corn crop that took place in southern Ontario in 1926 was observed by hundreds of business men, bankers, and State and Federal government officials from the United States with great concern, and its further advance in the corn belt made it evident that immediate steps must be taken to check it if possible. A voluntary committee of corn growers, specialists, and business men decided to appeal to Congress for an appropriation of \$10,000,000 to deal with the emergency. This action, indorsed by the Secretary of Agriculture, was approved by the President, with the result that a bill passed Congress February 23 making that amount available. The necessity for obtaining State regulatory legislation delayed the work until March 14, when the first equipment was purchased and operation actively commenced. The work was conducted under the leadership of the Director of Scientific Work and the head of the Division of Cereal and Forage Crop Insects of the Federal Department of Agriculture, who marshaled and coordinated all the available resources of that Department. The administrative officer, with headquarters at Toledo, Ohio, working in close cooperation with the officials of the several States, rapidly assembled a competent and efficient field organization, which instituted a clean-up campaign to hold in check the spread and control the increase of the insect. Two and one-half million acres of cornland, extending over a distance of 350 miles from New York to Indiana and including 64 counties, all but 500,000 acres of which were handled by more than 300,000 cooperating farmers, were cleaned up during the spring. The work consisted particularly in the plowing under or burning of cornstalks and debris to destroy the hibernating worms. Experts in agricultural engineering, agronomy, genetics, ecology, economics, animal husbandry, and extension from State experiment stations, agricultural colleges and the Federal Department of Agriculture, as well as entomologists, cooperated in the control campaign, and the Post Office Department assisted by placing important literature in the hands of each box holder on the rural routes in the clean-up area. The clean-up campaign came to an end on July 2, and, while the weather conditions had been most unfavorable, the results obtained were considered little short of marvelous. Estimates based on actual counts by men trained in the work indicated that at least 95 per cent of the corn borers throughout the treated area had been destroyed. It was announced by the U. S. Department of Agriculture that as a result of the spring campaign there was only one-sixth the normal increase in the number of borers in the western infested area.

The territory found newly infested during the year included areas in 3 counties in Pennsylvania, 5 counties in Ohio, 7 counties in Indiana, and 12 counties in Michigan.

EUROPEAN CORN BORER INVESTIGATION. An appropriation of \$685,120 was made by Congress for research and quarantine work with this pest, an increase of \$200,000 over that of the preceding year. The introduction of parasitic enemies from Europe progressed rapidly, nearly 500,000 beneficial insects having been liberated in the infested areas in the Central West, and 1,300,000 in the infested fields in New England. Six species were recovered in the field, indicating their establishment in America. Life history studies extending over four years showed that, under southern New Hampshire conditions, the progeny of the overwintering generation exhibit both a one-generation and a two-generation phase. It was found in Ohio that the longer corn is allowed to stand after it matures the lower down the corn borers make their way and the greater the number left in the stubble. Shredding the fodder destroyed 95 per cent of those that passed through the shredder, while cutting the stalks into lengths of one inch or less destroyed practically all the borers.

MEXICAN FRUIT FLY INFESTATION. This citrus-infesting pest, a native of southern Mexico, was discovered in May to infest grapefruit orchards in Cameron and Hidalgo Counties, Texas, where some 30,000 acres are now planted, a total of 685 specimens being found in 12 orchards located at various points in the two counties. There followed a campaign of clean-up and disposal of all hang-over citrus and other fruits in the district that would serve as hosts to carry the insect over to the succeeding year, conducted by the Federal Horticultural Board in cooperation with the State officials. Early in August quarantines were promulgated by the U. S. Department of Agriculture and the State of Texas, placing restrictions on the movement of susceptible fruits from the infested area, and calling for drastic controls within the area with a view to eradicating it there. Controls were placed on permitted fruit to limit its movement out of the district to five months of the year, or from October to February, with the object of thus maintaining a seven months' starvation period in which there would be no fruit suitable for propagation of the pest.

PINK BOLLWORM. The pink bollworm infesting cotton was found to have spread, probably from Mexico, into three counties in southwestern New Mexico and three counties in southeastern Arizona, some 10,000 acres consisting of small areas more or less widely separated by stretches of mountain and desert being infested. An intensive inspection was made of the 1926 crop of cotton in the invaded counties, and clean-up work was conducted in infested fields so far as possible by the Federal Horticultural Board in cooperation with the two States. The pest appeared to have been exterminated from the fields found infested in eastern Texas and Louisiana, no evidence of any renewal of infestation having been found since 1921. The infestation in the old area along the Mexican border west of the Pecos River remained about the same as it was in 1926.

THURBERIA WEEVIL SPREAD. The Arizona wild-cotton weevil spread widely from its native host and home in the mountains of southeastern

Arizona into some 1500 acres of recently developed cotton areas in Cochise and southern Graham counties, and a vigorous clean-up was made of infested fields.

COTTON BOLL WEEVIL. Infestation by the boll weevil was particularly high in the Piedmont region of the Cotton Belt. Sodium fluosilicate was found more effective against it than calcium arsenate in North Carolina. The greater part of the poison that kills the weevils was found, in Texas, to be picked up when traveling over the plants rather than by ingesting it while actually feeding.

COTTON FLEA HOPPER. The cotton flea hopper caused but little commercial damage to the cotton crop except in a few isolated fields in Texas. Dusts consisting of sulphur or equal parts of sulphur and calcium cyanide gave good control when applied once a week.

THE JAPANESE BEETLE. This beetle continued its spread, having been found in several counties on Long Island and in Westchester County, N. Y., and at Stamford and Bridgeport, Conn. It spread westward as far as Harrisburg, Pa., and established numerous colonies in northern New Jersey. Its spread southward was very small, only one additional township in Delaware being found infested. Within the infested area the beetles became exceedingly numerous over a territory of approximately 700 square miles. It was found in New Jersey that the larvae survive in cranberry bogs that are flooded for four months during the winter and spring.

THE ASIATIC BEETLE. The beetle *Anomala orientalis*, which is related to and resembles the Japanese beetle, discovered several years ago infesting lawns at New Haven, Conn., had spread, and in 1927 occurred on Long Island and in Westchester County, N. Y. It is primarily a pest in the grub stage to lawns and perennial plants, the adults apparently causing but slight injury.

JAPANESE GARDEN BEETLE. A destructive beetle, *Aserica castanea*, hitherto known to occur only on the islands of Japan, was discovered to have been established for several years in Northern New Jersey, Eastern New York, and on Long Island.

AUSTRALIAN VEGETABLE WEEVIL. This weevil continued to be a serious pest of vegetables in Mississippi, and appears to have become firmly established in California in the San Francisco Bay section.

MEXICAN BEAN BEETLE. This pest had spread to and was occupying the entire East Central and Middle Atlantic region excepting the Coastal Plain. It occurs as far north as southern Ontario in Canada, southeastern Michigan, westernmost New York east to Steuben County, the western part and the southern border of Pennsylvania east to Lancaster County, and western Maryland. But little advance was made to the west. In insecticide tests in Kentucky, calcium arsenate one part and hydrated lime nine parts gave the best results, only 2.85 per cent of the plants being injured.

THE ALFALFA WEEVIL. The alfalfa weevil was more destructive in eastern Idaho than in any year since 1921. A very slight extension of it took place in Colorado, its principal spread being along the Wyoming-Nebraska State line. The boundary of weevil-infested territory was everywhere in mountainous country where there were few alfalfa fields.

ORIENTAL PEACH MOTH. This fruit moth continued to cause serious injury to the peach, quince, etc., but investigations indicate that it is not likely to become a serious pest in Georgia and other southern peach districts. In control work in New Jersey, cultivation and the paradichlorobenzene treatment destroyed 86 per cent of the hibernating larvae, indicating that many overwinter in the upper portion of the tree and in sufficient numbers to constitute a continuance of infestation from year to year. Bait pails were used satisfactorily in Pennsylvania in capturing the moths, nonfermenting baits being found most practical. A parasite was very prevalent in New Jersey, causing an enormous reduction in the injury caused.

CODLING MOTH. This pest continued to hold its important place, and was the source of much investigation. It was recorded as attacking soft fruits in Colorado and cherries in Oregon. Tests indicate that the bands used as cocooning traps may be treated with a chemical toxic to the larvae, such as beta-naphthol and an oil emulsion. A cooperative attack against it in a fruit district in New Jersey having a very high infestation demonstrated that it can be brought under control by the careful and thorough application of the available knowledge.

DATE SCALE ERADICATION. The eradication work with the destructive *Parlatoria* scale has resulted in its complete elimination from the Salt River Valley in Arizona. At Yuma, Ariz., and in the Imperial and Coachella Valleys of California it still persisted, but was so scarce as to be only rarely located. The other scale pest still infested the palms, but was kept under control by spraying.

INSECTICIDES. The silicofluoride dust continued to be employed with success in insect control. It was the only insecticide which actually killed large numbers of the striped cucumber beetle in Arkansas and at the same time protected the plants for a number of days against the migrating beetles. Used in grasshopper baits in Colorado, it was more quickly and highly effective than the arsenicals. Used against the sugar cane borer in Louisiana its water-soluble elements acted both as a stomach and contact poison to the borer and may destroy two-thirds of the larvae in corn and cane. It was found more effective against the leaf weevil in North Carolina than calcium arsenate. Equal parts of sulphur and calcium cyanide were effective against the cotton flea hopper in Alabama. In fumigating citrus in California, less leakage through the tent took place where calcium cyanide was used than where the liquid cyanide was the source of the gas. Applied in the open furrow and covered by the turning furrow-slice, calcium cyanide killed 86 per cent of the wireworms. In Florida 95 per cent of the whitefly larvae and purple scale and 96 per cent of the red scale on citrus were killed by calcium cyanide. Diluted with two parts of sulphur, the calcium cyanide satisfactorily controlled the bean leafhopper in North Carolina, and in Delaware it was more effective than nicotine lime dust against the grape leafhopper. Paradichlorobenzene was used successfully against the underground form of the woolly apple aphid in the nursery in Tennessee, and against the black peach aphid in Ohio. Dissolved in the high-test gasoline and applied in liquid form around the base of peach trees, it was effective against the peach borer.

AIRPLANE DUSTING. The airplane continued to be used with success in the application of insecticide dusts for the control of tree- and field-crop insects. In Louisiana the sugar cane borer was fought by the application of 20 pounds of silicofluoride per acre in this way. In Wisconsin the hemlock span worm, a single defoliation by which kills the hemlock, was successfully controlled over an area of some 1700 acres by the application of 20 pounds of calcium arsenate per acre in this way. It was used with success experimentally in applying Paris green to destroy the malaria mosquito breeding in a 500-acre South Carolina pond covered with floatage.

APICULTURE. The demonstration of a method of instrumental insemination of the honey bee by Dr. L. R. Watson and his description of the technique perfected mark a long step forward and was the most noteworthy event of the year in the field of apiculture, opening as it does the way for improvement of the honey bee.

INSECT TRANSMISSION OF PLANT DISEASES. In Indiana the spinach aphid, which transmits tomato mosaic, was proved to be the principal agent in the dissemination of potato leaf roll, and the potato leafhopper to transmit the disease to a lesser degree. The potato leafhopper was found in Wisconsin to cause the yellowing of the margins of apple leaves, and alfalfa yellows was found both in Wisconsin and Tennessee to have been caused by it.

EPILEPSY. The fasting treatment of epilepsy which can be traced back to 1910 was tested by a number of clinicians but it soon became evident that its value is only palliative, for with the resumption of food the seizures return. About 1921 it seems to have occurred simultaneously to different observers that the undoubted benefit derived from fasting might be attributable to something beyond the actual deprivation of nourishment. As has long been known, the act of fasting sets up a general state known as acidosis, in which certain substances appear in the urine (diacetic acid, etc.). As it proved out of the question to administer these substances with any prospect of success, a diet was devised which is capable of causing an acidosis, consisting of low protein, low carbohydrate and high fat. It was found that this so-called ketogenic diet was able to influence favorably the course of epilepsy, at least in children. Nothing was published on the subject until some years had passed, when in 1924 Wilder of the Mayo Clinic and Petermann of Milwaukee announced that striking improvement had been established in the epilepsy of childhood. A distinction must be made between acidosis, which is a generic term, and ketone acidosis or ketosis which is a special type of acidosis. Apparently both elements are requisite to secure the good results—an acidosis and the ketosis. The ketogenic diet is preceded by a few days of fasting. In the *Journal of the American Medical Association* for

June 11, 1927, Dr. Petermann of Milwaukee announced that the fasting and ketogenic diet had proved itself by far the most effective means of treating epileptic children and in the same periodical for June 25, Dr. Helmholtz, the pediatrician of the Mayo clinic, gave the results of five years of experience with the diet in the true epilepsy of childhood. In theory the younger the patient the better the outlook. The characteristic of the ketogenic diet is its richness in fat, and the aim is the production of diacetic acid in the urine. It should be remarked that ordinarily acidosis is most unwelcome, representing as it does a pathologic state, but in connection with epilepsy no ill effects have been experienced even when the diet has been maintained for a long time. Helmholtz had treated 91 epileptic children during the five-year period and over half (54 per cent) have responded favorably to the treatment. Of this number about a third of the whole (31 per cent) enjoyed such long remissions that they may be regarded as cured. At the same time 46 per cent received no benefit whatever. When it is borne in mind that the ordinary recovery rate of true epilepsy is put at not much above 5 per cent the success of this resource must be characterized as brilliant. There was no evidence submitted that the diet can favorably influence adult epilepsy.

EPIRUS. A geographical expression applied to a territory, the northern part of which belongs to Albania and the southern part to Greece. The boundaries are indefinite. The Greek portion corresponds to the departments of Yanina and Prevesa, with populations in 1923 of 173,304 and 52,462 respectively. Northern Epirus had an estimated population of 250,000.

EPISCOPAL CHURCH. See PROTESTANT EPISCOPAL CHURCH.

EPWORTH LEAGUE. See METHODIST EPISCOPAL CHURCH.

ERGOSTERIN, ERGOSTEROL. See FOOD AND NUTRITION; RICKETS.

ERICSON. JOHN ERNST. American civil engineer and city engineer of Chicago, died in that city, April 16. He was born in Stockholm County, Sweden, Oct. 21, 1858, and, after graduating from the Royal Polytechnic Institute, Stockholm, in 1880 went to the United States. After serving as resident engineer of the Toledo, Cincinnati and St. Louis R. R., 1881-82, he became connected with the United States Corps of Engineers until 1884, when he entered the Chicago water department as a draftsman. In 1885 he was made an assistant engineer of the bureau of engineering, and in 1889-90 was assistant chief engineer of water works at Seattle, Wash. In 1892 he returned to the bureau of engineering of Chicago, becoming first assistant engineer in 1893 and in 1897 city engineer, a position he held at his death. He resigned in October, 1919, but acted as consulting engineer until 1923, when he was reappointed. Ericson's work was specially connected with the development of the Chicago water supply system. He connected the supplies of several annexed towns so as to form a unified system, and built new lake and land tunnels for the city proper. He also improved the distribution system and introduced chlorination, and shortly before his death undertook investigations and improvements for the filtration of the city's water on a large scale. He was able to develop metering of Chicago's water to check waste, and extensive

progress was made in this direction, although in 1927 Mayor Thompson proposed to repeal the metering ordinance. From 1911-14 he was chairman of the harbor and subway commission of the city. A special type of bascule bridge was designed by Mr. Ericson. In 1903 he declined the post of director of public works of Stockholm, and in 1913 he was made a knight of the Royal Order of Vasa by the King of Sweden.

ERIE CANAL, ANNIVERSARY OF. See **CELEBRATIONS.**

ERITREA. An Italian colony in Africa. It lies on the coast of the Red Sea, extending from Cape Dumeirah and the Strait of Bab-el-Mandeb to Cape Kasar, a distance of 670 miles. Area, 45,754 square miles; population, at the census of 1921, 402,793 natives and 4251 Europeans. The seat of government is Asmara, situated 7765 feet above sea level, with a population of 14,711, of whom 2500 are Europeans. Massawah is the principal trade centre, with a population of 2275 in 1923. The natives are chiefly Coptic Christians and Mohammedans and they speak a dialect of Abyssinian in the plateau region and Arabic in the lowlands. The local trade is almost entirely confined to camels, oxen, sheep, goats, and their products.

Although there is an abundant area of pastoral land the pastoral population is largely nomadic. There is considerable trade in palm nuts, and pearl fishing is pursued at Massawah and in the Dahlak Archipelago. For the fiscal year 1925-26, the revenue and expenditure of the colony were estimated at: Colonial revenue, 36,430,000 lire; expenditure for colonial administration, 24,674,000 lire and for military purposes, 11,765,000 lire. Governor at the beginning of 1927, Dr. Jacopo Gasparini (appointed in 1923).

ERIVAN. See **ARMENIA.**

ERYSIPPELAS. Bellevue Hospital, New York City, had in 1927 the largest and most active erysipelas service in the world and during the previous 23 years 15,277 cases had been treated there with a mortality of a little over 10 per cent. During this period every form of treatment was tested but without bringing down the mortality or shortening the average duration of the affection. In 1926 (see **YEAR BOOK** for that year) Birkhaug reported the first test of a special anti-toxin which showed a decided improvement over other methods, and since that period the same preparation has received a full test at Bellevue, 131 patients having been submitted to it with a mortality of only 5.3 per cent, which contrasts strongly with the 11.2 per cent in a series of 107 cases which preceded the anti-toxin period. Moreover, the average duration of the disease and period of disability were shortened in a most gratifying manner, the latter by a little more than one half, which was a decided economic gain owing to the fact that these patients are mostly workers. Most of the patients suffer from facial erysipelas, and here the mortality went as low as 4.5 per cent. Erysipelas of the body is naturally far more deadly, at times with as high as 40 per cent mortality; but under the anti-toxin it came down to about 10 per cent. The greater the proportion of old, debilitated and debauched patients the higher the mortality.

ESSAYS. See **LITERATURE, ENGLISH AND AMERICAN; FRENCH LITERATURE; GERMAN LITERATURE;** etc.

ESTONIA. A Baltic state comprising the following portions of the former Russian Empire: The province of Estonia, the islands of Moon Sound, the northern part of Livonia, part of the northwestern part of the district of the Pskov government, and a small portion of the Petrograd government; declared independent Feb. 24, 1918, and recognized by the Council of the League of Nations, Jan. 26, 1921. Capital, Tallinn (Reval).

AREA AND POPULATION. The total area is about 18,354 square miles; population, at the census of 1922, 1,110,538, of whom 92 per cent were Estonians, 1.5 per cent Germans, and 6.5 per cent Russians and other nationalities. Five-sixths of the population are Lutherans, and the rest Greek Orthodox, Roman Catholic, etc. The population on Jan. 1, 1926, was estimated at 1,115,000. Tallinn or Reval, the capital, had a population of 127,000 in 1926. Dorpat (Tartu), the seat of the university of the same name, had about 59,000 inhabitants. Other large towns are: Narva, a manufacturing town, with about 27,000, and Parnu, with about 27,000.

EDUCATION. Primary instruction is free and compulsory. In 1924-25 there were 1392 elementary schools; of this number 1337 were supported by local authorities and 55 were private schools. The number of middle schools for general education, gymnasiums, etc., was 86, of which 27 were private schools. For special or professional education there are five teachers' seminaries, four navigation schools, commercial schools, mercantile schools, and industrial and art schools. For higher education there is the University of Dorpat (founded in 1632) which had 4497 students in 1925, and the Technical Institute at Reval, with 380 students in 1924.

PRODUCTION. The chief occupation is agriculture. The total area of about 10,851,048 acres is divided as follows: Forest land, 2,220,002 acres; fields, 2,532,799 acres; meadows, 2,602,274 acres; pastures, 1,836,302 acres; untillable land, 1,632,206 acres (including a peat bog of 496,112 acres). The acreage and yield of the principal crops in 1925 was as follows: Rye, 382,489 acres, 185,531 tons; wheat, 50,730 acres, 21,880 tons; barley, 233,720 acres, 117,032 tons; potatoes, 170,304 acres, 680,272 tons; and oats, 371,399 acres, 128,670 tons. The livestock census of 1926 showed 599,104 head of cattle, 665,971 sheep; 333,144 pigs, 226,359 horses, 797,624 head of poultry. In 1925 Estonia had 3738 industrial establishments with 35,579 workmen.

COMMERCE. In 1926 imports were valued at 9,556,975,000 marks and exports at 9,637,573,000. The principal imports in 1926 were: Grain and flour, 1,938,080,000 marks; cotton, flax and other textile materials, 1,107,612,000; foodstuffs, 1,106,377,000; textile products, 930,255,000; machinery, 731,279,000; principal exports, dairy produce, 2,778,968,000; timber, 1,832,765,000; textile products, 1,433,256,000.

FINANCE. The budget for 1927-28, passed by Parliament on January 8, was balanced at 8,923,300,000 Estonian marks, an amount higher by nearly 75,000,000 marks than the budget for 1926-27. A meeting of the Inter-Ministerial Committee, held early in February, decided to call the Estonian monetary unit the "est" which will be equal in value to the gold crown (same as the Scandinavian gold crown, \$0.268). One est will contain 100 sayak. No gold money will be minted, although the monetary system will be or-

ganized on a gold standard basis. The foreign debt of Estonia on Nov. 1, 1926, consisted of \$13,830,000 to the United States, £1,120,670 to Great Britain, and 1,300,000 crowns to Sweden, which have all been funded by special agreements.

COMMUNICATIONS. The railways in Estonia are owned and operated by the state and at the close of 1925 comprised 674 kilometers of main standard-gauge line and 515 kilometers of narrow-gauge line. Operating revenues during 1925 amounted to 1,205,338,000 marks, as compared with 1,096,040,000 marks in 1924; operating expenses amounted to 1,133,564,000 marks in 1925. Rolling stock in operation consisted of 203 locomotives, 5102 freight cars and 441 passenger cars. Construction during 1925 covered 12.3 kilometers of standard-gauge line and 25 kilometers of narrow-gauge. During 1925, 2566 vessels of 768,094 tons entered and 2545 vessels of 774,004 tons cleared from the ports of Estonia.

GOVERNMENT. According to the constitution of the Estonian republic, passed by the Constituent Assembly on June 15, 1920, and put into force December 20 of the same year, executive power is in the hands of a state head or "State Elder" and a ministry, both chosen by and responsible to the State Assembly; legislative power, in the hands of the State Assembly of 100 members elected for three years on the basis of proportional representation and by direct, universal, and secret suffrage. The Assembly forms the government and accepts its resignation, promulgates the laws, passes the budget, decides the financial policy generally, ratifies treaties, etc. The principle of the referendum is recognized for the proposal or amendment of the laws, but not in relation to measures affecting the budget, or war, peace, or foreign affairs. State Elder in 1927, Jaan Teemant (Agrarian).

HISTORY. Early in the spring a new cabinet was constructed by Jaan Teemant. It was composed as follows: Premier, Jaan Teemant; Foreign Affairs, Dr. Akel; Interior, M. Huenerston; War, Gen. Reck; Finance, M. Sepp; Justice, M. Tief; Agriculture, M. Koester; Public Instruction, M. Lattik; Communications, M. Kerem; Commerce, M. Kornel; Social Welfare, Dr. Masing. The assembly ratified this cabinet, which was the same as the old one with the exception of Messrs. Huenerston, Masing and Reck. The relations with Soviet Russia during the year were more or less friendly, an attempt being made to arrange a non-aggression pact between the two countries. In a sensational trial in November, M. Birk, former Estonian Minister to Moscow, was acquitted of a charge of treason, after he told a weird story of being kidnapped by the Russian secret police and forced to sign articles attacking Estonia, which appeared in a Russian newspaper. He claimed he never even saw the articles he signed.

ETHIOPIA (formerly **ABYSSINIA**). A country in West Africa between the Anglo-Egyptian Sudan and the Red Sea comprising the provinces of Harar, Equatorial Provinces, Gondar, Jimma, Wollo, Shoa, Sellale, Edjow, Wollaga, Guimira, Gojam, etc. The area has been variously estimated at from 350,000 to 430,000 square miles. The former figure is probably the more accurate. The most recent estimate of the population places it at about 10,000,000, although the Abyssinians, properly so called, number less than 3,500,000. They are Christians of Hamitic

origin. The capital is Addis Abeba, with a population of from 60,000 to 70,000, of whom about 1000 are foreigners. The other chief city, Harar, has a population of about 40,000. Domestic slavery is a recognized institution, but slave trading, by an ancient law renewed by a decree issued in June, 1923, is punishable by death. In March, 1924, an edict was issued by Ras Tafari, providing for the gradual emancipation of slaves, beginning with the children born of slaves.

The backward methods of agriculture and the lack of adequate means of transportation have continued to retard economic development. The chief pursuits are agriculture and stock raising. The system of land holding is feudal and the soil theoretically belongs to the Negus or Emperor. The products include cotton, sugar cane, the date palm, coffee, and grapes, but, with the exception of coffee, they are nowhere extensively raised. The production of the so-called Harari coffee is increasing from year to year. There is a wild coffee plant which is found especially in southern and western Abyssinia bearing a berry known as Abyssinian coffee, of which the supply is said to be unlimited. Among the other native products are hides and skins, millet, wheat, barley, and tobacco, and there are valuable forests including rubber. In some districts iron is found and is used in the manufacture of native weapons. In the western districts the mining of gold has been carried on, and coal, copper, and sulphur are also found.

No reliable figures for exports and imports are available, but, according to a British authority, they reach £2,500,000 annually. The chief exports are hides and skins, coffee, wax, ivory, civet, and native butter; and the chief imports, cotton shirting, cotton goods, liquors, railway materials, provisions, sugars, and petroleum. The principal line of trade is along the French-Ethiopian railway but there is a considerable caravan trade in the interior. The imports came mainly from the United States, Great Britain, France, India, Italy, and Japan. Trade with Great Britain in 1926 was: Imports from Abyssinia, £105,642; exports to Abyssinia, £16,368.

The French-Ethiopian railway connects Djibuti in French Somaliland with Addis Abeba, a distance of about 495 miles. The line is of meter gauge. Trains run twice weekly, covering the distance in three days. The carrying of freight is consequently a monopoly and foreign goods suffer from extremely high rates. There are about 2000 miles of telegraph line and a few miles of telephone connection. In 1927 the Empress was Waizeru Zauditu, daughter of the late Menelik. She was named Empress after the deposition of Lij Yasu in 1916; but the actual authority rests in Ras Tafari, great-nephew of Menelik, who has been proclaimed heir to the throne and who acts as Regent. In August, 1919, a modified form of cabinet government was introduced, but its powers are rather shadowy. Ethiopia is a member of the League of Nations.

HISTORY. In the London *Times* of June 2, it was stated that the American Department of Commerce had issued an appeal to American capital to enter Abyssinia (Ethiopia), "an almost virgin field for productive effort," a fact which should be considered in connection with the repeated attempts of Ras Tafari, the Regent of Ethiopia, to persuade President Coolidge to appoint an American Minister at Addis Abeba.

In a statement to the press the Regent suggested that American capitalists should employ the slaves who still constitute a large part of the population for development of coffee, rubber, and copper, paying the slave owner a yearly sum for five years as a rental for this human property, after which the slaves should be "free"—although the nature and degree of this freedom were not defined.

The Regent's promise to the League of Nations in 1923 to abolish slavery and forced labor had not been carried out, and, according to the *Times*, the proposal that American capital should help to destroy this system by condoning it for five years would not find favor in Great Britain. The advantage which the Regent would seek to derive in his dealings with Great Britain, France and Italy from the presence of an American diplomatic representative and the creation of American commercial interests in Abyssinia, however, was not difficult to imagine.

EVANGELICAL CHURCH. A denomination formed by the union of the Evangelical Association and the United Evangelical Church. The former was the outgrowth of a religious movement started in Pennsylvania in 1800 by the followers of Jacob Albright. In 1892 a number of ministers and members organized themselves into the separate denomination known as the United Evangelical Church. At length the growing conviction that the two churches should be reunited led to the appointment of commissions, which drew up the so-called Enabling Act. The new organization was officially established at Detroit, in 1922. At the time of merging, the Evangelical Association had 167,416 church members and the United Evangelical Church 92,001. At the end of 1927, there was a total membership of 254,839. There were 1942 itinerant preachers and 475 local preachers. Of 26,569 received into church membership during the year, 15,502 came on profession of faith. Sunday schools numbered 2898, of which 710 were in the foreign mission fields in China, Japan, Germany, and Switzerland. Of the total enrollment of 372,943, China had 4070; Japan, 3717; Europe, 42,774. The total amount raised by the Sunday schools was \$480,262.13. The Christian Endeavor Society membership was 71,830. There were 1426 Woman's Missionary Societies in the denomination, with a membership of 42,531. The total value of all property was \$36,435,879. The money raised during the year totaled \$7,027,475.98, an average of \$27.57 per member. The chief schools of the denomination were: North Central College and Evangelical School of Theology, Naperville, Ill.; Western Union College, Le Mars, Iowa; Albright College, Myerstown, Pa.; Schuylkill College and School of Theology, Reading, Pa. Two orphanages and six Old People's Homes were maintained in the United States, as well as several hospitals. The church had 24 conferences in the United States, two in Canada, one in Japan, two in Germany, one in

Switzerland. There were two publishing houses, one in Cleveland, Ohio, and the other in Harrisburg, Pa. The Church issues two official papers, the *Evangelical Messenger*, in English, and *Christliche Botschafter*, in German. It was planned to hold the next general conference in Milwaukee, in October, 1930.

EVANGELICAL SYNOD OF NORTH AMERICA. THE. A religious communion, strictly evangelical in principle as historically crystallized from the Reformation of the sixteenth century and as embodied in the Reformed and Lutheran doctrinal statements, accepting these statements as far as they agree. Where they disagree, however, the Evangelical Synod adheres strictly to the passages of Holy Scripture bearing on the subject and avails itself of the liberty of conscience prevailing in the Evangelical Church. The communion was organized in 1840 at Gravois Settlement, Missouri, and consolidated in 1877 with similar communions. The church is organized in 19 districts with extensive power of self-government. Presidents of districts, clerical delegates and lay delegates meet in General Conference every fourth year. A quadrennial Conference was held in 1925 and an Extraordinary General Conference adopting a new constitution, in 1927. In 1926 the organization included 1118 pastors, 1332 congregations with 336,118 communicant members, and 1250 Sunday schools with 188,590 members. Money raised by the denomination for all purposes in 1926 amounted to \$5,870,387. Church property was valued at \$40,674,172. Missionary work was carried on in the United States, India and Honduras. In the United States there were over 100 missionaries, men and women, active in about 135 communities. The Board of Foreign Missions reported an income of over \$161,361.20 for 1926, and had 14 men, one of them a medical worker, and 17 women as missionaries in India, in addition to 333 native workers. In Honduras there were 11 missionaries at two stations. The denomination maintains four institutions of learning: Eden Theological Seminary, St. Louis, Mo.; Elmhurst College, Elmhurst, Ill.; Robinson Academy, Waco, Tex.; and Oakwood Institute, Cincinnati, Ohio. The chief periodicals published are *Der Friedensbote*, *The Evangelical Herald* and *The Light Bearer*.

EXPLORATIONS. Along strictly geographical lines there did not appear to have been any important search for unknown regions, beyond those mentioned in POLAR RESEARCH (q.v.). Aviation flights and cursory views—with the insatiable demands for "records"—had changed methods of exploration as well as many other pursuits.

Search for the unknown during 1927 was confined almost wholly to the domains of ARCH-

ZOOLOGY (q.v.) and biology—to ascertain the life conditions of prehistoric ages, and to discover how life itself continues in its myriad forms.

Of especial interest archaeologically were the results obtained by C. L. Woolley, director of the Chaldean explorations which, for some years, had been pursued by joint action of the British Museum and the University of Pennsylvania. The recent excavations of 180 graves at Ur, south of Baghdad in the valley of the Euphrates, revealed secrets of life in the fourth millennium before Christ.

Most remarkable were evidences of burial rites, as practiced in Mesopotamia more than 5000 years ago. In one great burial pit, a score of skeletons and the surrounding magnificent paraphernalia, such as a chariot for transportation, a harp for music, and household articles of gold and silver, etc., indicate that the death of a king had been followed by fitting provisions for his comfortable royal journey into another realm. He was to be accompanied by his slaves and harem, who carried along their elaborate ornaments and vanity cases. Evidently when a king died, so did his intimates.

In the near Orient, Dougherty, for Yale University, unraveled the mystery of Babylonian craft-methods, which were so notably efficient in architecture, irrigation, navigation and soil culture.

The Liverpool University party excavated at Armant, near Luxor, a large sandstone sarcophagus, possibly of religious importance.

In Greece search for relics of ancient ages progressed. Biegen, for the University of Cincinnati, unearthed at Nemea in the temple of Zeus a prehistoric crypt. Continuing its researches at Asine, the Swedish Archaeological Society obtained as many pre-Mycenaean and Pelasgic objects as filled 300 cases.

Denmark continued its researches in GREENLAND (q.v.).

The Mexican Department of Archaeology was studying its pre-historic remains. In so doing it had discovered in an Aztec pyramid a stone sepulchre. Its treasures are guarded by 95 carved snakes. These and other sacred relics illustrate Aztec life and religious rites.

Besides its Arctic expeditions Soviet Russia was active in researches to develop its resources and correct its maps. Economically important was the discovery by Chitscherbakov of large deposits of sulphur in the Karakoram region. The palaeontological investigations of the Leningrad Academy of Sciences indicate great changes in the fauna and climate of the Crimea, in past ages. France confines its work to its colonies, Syria, Madagascar and Indo-China.

AMERICAN EXPLORATIONS. As usual the educational institutions of the United States were active in research, having sent more than 70 expeditions into foreign fields. In this work especial efforts were made by the Smithsonian Institution, the American Museum of Natural History, the Field Museum, and the Carnegie Institution. Space permits reference to results only when they are specially striking. Apart from those at Ur, already mentioned, attention is drawn to the researches of the Carnegie Institution in Central America. These resulted in the most remarkable archaeological discoveries in the western world.

The Temple of Warriors at Chichen Itza, Yucatan, the sanctuary of the patron deity, Ku-

kulcan, was restored. This exquisitely beautiful specimen of Mayan architecture rests on a base 37 feet high, and 137 square. The Temple rises in four retreating terraces, carrying richly sculptured friezes of warriors, birds and animals. The colors used in ornamentation are of striking brilliancy. It is hoped that the work at Uaxacton and Morella, Guatemala, and Etz-na, Yucatan, may be equally fruitful.

The following lists carry only the names of the leaders, kind of research and of regions:

CALIFORNIA. *Academy of Sciences*: Haley, biology, Nunivak, Alaska.

CONNECTICUT. *Yale University*: Dougherty, archaeology, Babylonia; Whitney, mammals, Alaska.

DISTRICT OF COLUMBIA. *Carnegie Institution*: Amsden, archaeology, Guatemala; Morley, archaeology, Yucatan, also Chichen Itza. *National Geographical Society*: Judd, archaeology, Pueblo Bonito (in cooperation with Smithsonian Institution); Rock, ethnology, Hsiang Cheng, China; solar radiation, Africa (in cooperation with Smithsonian Institution). *U. S. Department of Agriculture*: Dorsey, botany, China; Kephart, grasses, British East Africa; McKinney, plant pathology, West Africa.

U. S. National Museum: Bassler, palaeontology, France and Germany; Collins and Stewart, anthropology, Nunivak; Foshag, mineralogy, Mexico (with Harvard University); Hrdlicka, anthropology, Alaska; Judd, archaeology, New Mexico; Killip, birds, botany, Colombia; Schmitt, crustaceans, South America; Krieger, ethnology, Yukon; Smith, zoology, Siam; Stirling, anthropology, Dutch New Guinea; Wetmore, fauna and flora, Haiti.

ILLINOIS. *Field Museum*: Borden, zoology, Alaska; Conover, zoology, Tanganyika; Faunthorpe, zoology, India; Langdon, archaeology, Mesopotamia; Linton, anthropology, Madagascar; MacMillan, general, Labrador; Osborn, zoology, Abyssinia. *Daily News*: Field, prehistoric culture, Asia and Europe; Riggs, fossils, Argentina; Sanborn, zoology, Brazil; Tansill, zoology, Kodiak; White, zoology, Abyssinia; Weberbauer, botany, South America. *University of Chicago*: Breasted, archaeology, Egypt; Chamberlain, geology, Canada; Taylor, ethnology, Finland.

MARYLAND. *Johns Hopkins*: Berry, botany, South America.

MASSACHUSETTS. *Harvard University*: Putnam and Wulsin (Peabody Museum), archaeology, French Sudan; Strong, biology, medical survey, Liberia; Winn and Blake, archaeology, Mt. Sinai; Foshag, minerals, Mexico.

MICHIGAN. *University of Michigan*: Bartlett, botany, East Africa; Little, biology, Faeroes; Hobbs, meteorology, Greenland; Kelsey, archaeology, Karanis, Libyan Desert.

NEW YORK. *American Museum of Natural History*: Anthony and Taylor, birds and mammals, Blue and White Nile; Beck, birds, South Seas; Chapin, Sage and Mathews, birds, South Africa; Chapman and Evans, birds, Canal Zone; Goodwin, mammals, South Quebec; Griscom and Crosby, birds, Panama; Hay, anthropology, Mexico; Heilner, zoology, Alaska; Granger and Nelson, fossils, South China; Pratt, educational films, Europe; Morden and Clark, fauna, Chinese Turkestan; Putnam, mammals, Baffin Land; Schmidt, archaeology (in cooperation with University of Chicago); Tate and Carter, birds and mammals, Roraima, Venezuela; Valliant,

archæology, North Africa; Vernet, museum specimens, India.

OHIO. *University of Cincinnati*: Wherry, medical survey, Mexico; with American School of Classics, archæology, Nemea, Greece.

PENNSYLVANIA. *University of Pennsylvania*: Beisan, archæology, Mesopotamia; Harshberger, botany, Argentina and Chili; Woolley, archæology, Ur (in cooperation with the British Museum).

WISCONSIN. *Beloit College*: Collie, anthropology, North Africa.

CANADA. Mackenzie cruised in the *Beothic* to the police station on Bache Peninsula, 70°04' N.; heavy ice debarred him from Melville Island. On Baffin Island, Dr. Livingston sledged 2500 miles and cared professionally for every sick Eskimo, while Weeks, traveling 2300 miles, examined geologically Cumberland Gulf and other regions.

MEXICO. The discovery by the Mexican Department of Archæology of an Aztec pyramid has been referred to above.

EUROPEAN EXPEDITIONS. *Denmark*. Koch, fossils, Greenland (q.v.); Jorgensen, surveys, Greenland (q.v.); Nielsen, topography, Iceland: Olufsen, ethnology, Senegal. *England*: British Museum: archæology, Ur (in cooperation with University of Pennsylvania); Liverpool University: Mond and Emery, archæology, near Luxor. *France*: Société de Géographie: Poidetard and Dunmard, archæology, Syria; Société de Géographie: Dumbrava, glaciology, Greenland (cooperating with Belgian Société de Géographie); Decary, ethnology, Madagascar; Dewar and Howman, political, Indo-China. *Germany*: Schultz, fisheries, Barents Sea; *Italy*: Naples excavating Herculaneum. *Russia*: Academy of Sciences, palæontology, Crimea; Geographical Society, ethnology, Kola Peninsula (See POLAR RESEARCH); Chitscherbakov, geology, Karakoram; Mikhailevski, biology, Caspian Sea; Obrouchev, geography, Siberia (See POLAR RESEARCH). *Sweden*: Floderus, plants, Kola Peninsula.

ARGENTINA. An expedition cooperating with the British Museum investigated the fauna and flora of the unexplored forests in northwest Patagonia.

AUSTRALIA. Cleveland and Campel made researches on aborigines in the interior, under the auspices of the Rockefeller Foundation.

EXPOSITIONS. No general international exposition was held during the year 1927.

SESQUI-CENTENNIAL EXPOSITION AT PHILADELPHIA. The gate receipts of this exposition failed to realize expectations and consequently on April 23, in order to protect the claims of all creditors and to prevent claimants who had started suits from becoming preferred creditors, the United States District Court in Philadelphia appointed former State Attorney-General F. S. Brown and Director-General Austin receivers to hold the assets intact until a plan could be worked out for the liquidation of the Sesqui-centennial property and the distribution of proceeds among creditors. A report issued in June showed that the income of the exposition, including the \$5,000,000 deficit appropriation, totaled \$18,216,139 and its expenditures \$18,428,126. It established the City of Philadelphia's appropriations for the fair at \$3,080,000, which did not include more than \$4,000,000 spent by the City Council in developing the South Philadelphia site

of the exposition and \$3,000,000 spent on the Sesqui stadium. Visitors to the fair paid \$2,403,991 in admission fees and spent \$693,212 with concessionaries, while exhibitors paid a total of \$1,400,890 in rental fees for exhibit space. The liabilities statement listed operating debts, which the City Council refused to pay when the deficit was acted upon, at \$648,613 and so-called "development bills," to be paid from a \$5,000,000 loan by the Council, at \$4,859,228. The association also had facing it claims of \$5298 for "accrued payroll" obligations and \$4563 in purchase commitments.

FUTURE EXPOSITIONS. The Seville Exposition, known officially as the Ibero-American International Exposition of Art, Commerce, and Industry, was announced to open in Seville, Spain, on Oct. 12, 1928, and to continue until June 30, 1929. It was originally named the Hispano-American Exposition, but in 1922 the name was changed so as to include Portugal and Brazil. The exhibits were to be confined to those from the countries in the Iberian peninsula and those American nations discovered or settled by Spanish or Portuguese navigators and explorers. The site included 2400 acres on the outskirts of Seville, one entrance being three-fourths of a mile from the centre of the city and the other three miles distant. The buildings, which were to be permanent, were to be elaborately decorated in color and in the best style of Spanish and Moorish architecture. The grounds were to be laid out in an attractive manner with a setting of floral beauty not hitherto attained by any exposition. The principal structure was the "Plaza de España" built in a half circle with a central court 600 feet across, and with 49 divisions in each of which were to be exhibits of the 49 provinces of Spain. Other large buildings were those devoted to Fine Arts, Ancient Arts, and a Royal Pavilion. Also there were special buildings erected by Argentina, Mexico, Peru, Portugal, and the United States. The United States Congress appropriated \$700,000 for participation in the exposition and a permanent pavilion designed by American architects was erected. The Commission consisted of former Gov. Thomas E. Campbell of Arizona, commissioner-general, and Miss Agnes Repplier of Philadelphia, Pa.; Mrs. Fred W. Upham of Chicago, Ill.; John F. O'Brien, former Secretary of State of New York; Judge Roderick N. Matson of Cheyenne, Wyo.; and George T. Cameron of San Francisco, California.

No further information concerning a World's Fair to be held in New York in 1932 was published. In August the *Chicago Tribune* announced that the administration of Mayor Thompson had decided to abandon the plan for a world's fair and centennial exposition in 1933. In September, however, this question was reconsidered by Mayor Thompson.

Belgium was making active preparations for an exposition in 1935 to mark the centenary of the gaining of independence by that country. At the same time there was to be celebrated the 100th anniversary of the laying of the first railroad line in Belgium and in Europe, and also the jubilee of the foundation of the Congo Free State. The exposition was to be held in Brussels, and Belgium was already preparing for it. The City of Brussels voted 25,000,000 francs as a beginning. Invitations to participate were being extended to other countries. Antwerp

was laying plans for an international colonial and naval exhibition to be held in 1930.

TRADE FAIRS. The usual spring fair was held in Lyons, France, during March 7-20. It corresponded favorably with previous similar fairs and some 3000 manufacturers representing 20 foreign countries were reported to have had exhibits.

The annual spring Leipzig fair was held during March 6-12 and was attended by 150,000 visitors including 20,000 foreigners, of whom not more than 1500 were Americans. There were 9300 exhibitors, mostly from Germany, while, from abroad, Austria and Czechoslovakia provided the largest numbers. An important feature of the exhibits was the evidence presented of the development of the German machine tool industry, particularly with regard to series and mass production machinery. Decided progress was noted in this class of equipment, with resulting increased capacity to compete against American machinery. Another important development was seen in the many new applications of small-sized full Diesel engines, as for road rollers, concrete mixers, and other industrial machinery. One of the foremost features was the Russian exhibit, which was mainly confined to raw as well as half-manufactured materials. Business was brisk, with quick bargains, and, in the opinion of many American buyers, the best since the inflation period.

The fall fair, held at the beginning of September, was not a failure although somewhat disappointing. Sales of toys were especially dull, but some activity was noted in construction machinery, novelties, tools, specialties, and office equipment. Business in all technical and engineering lines was slack, mainly as a result of the absence of prominent exhibitors. Two of the leaders in the German porcelain industry were able to book substantial orders for the fall and Christmas trade. New lines of porcelain tableware brought out were favorably received. The fair was marked by cautious buying by domestic customers and by the practical absence of foreign buyers with the exception of some from France, Poland, and other European countries.

During Oct. 3-18, 1926, a first international fair was held in Saloniki, Greece. Within an area of 5000 square meters covered by the exhibition, six large pavilions were occupied by Greek industrial and agricultural products and two by foreign exhibits. Bulgaria and Soviet Russia were the only foreign nations to take complete pavilions. In addition to those there were 19 small private pavilions constructed by local concerns, 14 of which contained entirely Greek exhibits, one Greek and French, one Greek and Swedish, one Swiss, one American, and one Hungarian. The machinery was all exhibited in two long open stands. The total number of commercial, industrial, and agricultural organizations represented in the fair was 580, exclusive of the 42 Russian State units. The visitors numbered 110,000 and the business transacted by exhibitors exceeded \$63,000. The financial and commercial success of this fair was so great, especially as providing a new method of contact between foreign manufacturers and the buying public of the Levant, that a second similar fair was held during Sept. 18-Oct. 3, 1927.

The world-famous Nijni Novgorod Fair, which opened on August 1, during its first weeks prom-

ised to prove the most brilliant since the inception of the "New Economic Policy" in 1921, but later a sharp decline in transactions destroyed such hopes. The figures up to and including September 7 (the air closed on September 14) showed a total turnover of 101,785,000 rubles against 107,078,000 in the previous year. The number of foreign contracts signed fell from 3660 to 3014. The Soviet coöperative societies traded more than ever before, the customers' co-operatives alone buying to the extent of 45,000,000 rubles. Fur contracts were satisfactory, especially those with Germany, an order having been given to deflect as far as possible the fair's fur deals to Leipzig and New York. The decline in the fair's total turnover was attributed chiefly to the smaller attendance of Asiatic merchants, chiefly the Persians. In order to counteract a Persian boycott of Russian goods, Moscow conceded the most liberal conditions to Persia's trade with Russia and, moreover, fixed a special quota of 8,000,000 rubles for Persian imports to the Fair.

FAIRCHILD, SAMUEL W. American manufacturing chemist, died at New York City, November 13. He was born at Stratford, Conn., Aug. 22, 1852, and was educated at the Stratford Academy and private schools, graduating from the Philadelphia College of Pharmacy in 1873. With his brother, Benjamin Fairchild, in 1879 he founded the chemical firm of Fairchild Brothers, which two years later was combined with the house of Macomb G. Foster, becoming the firm of Fairchild Brothers & Foster, well known for their pharmaceutical preparations. Mr. Fairchild was active in many fields, and was president of the New York College of Pharmacy from 1890 to 1896, during which period the work of the institution was extended and developed. In 1904 he founded the Fairchild scholarship for pharmacy students in Great Britain and Ireland, and in 1915 the scholarship for students in the United States. In 1911 he received an honorary degree from Columbia University for his work in developing drugs and chemicals, having previously received the degree of Pharm.M. from the Philadelphia College of Pharmacy. He was the first chairman of the drug trade section of the Board of Trade and Transportation of New York, vice president of the Chamber of Commerce of New York, and incorporator of the Botanical Gardens, vice president of the Sevilla Home for Children, trustee of the Polyclinic Medical School and Hospital, and for several years president of the Union League Club of New York City. For his work during the War he was made a Chevalier of the Legion of Honor of France, and received the Cross of an Officer of the Order of Leopold II of Belgium, in addition to a decoration from Queen Elizabeth or services in organizing the Belgian relief. For his work in Greece he was awarded the Golden Cross of a Chevalier of the Royal Battalion of George I. He received many honors in the city of New York, being prominently identified with social and philanthropic organizations and movements.

FAIR OF THE IRON HORSE. See BALTIMORE AND OHIO R. R. CENTENARY.

FAIRS. See EXPOSITIONS.

FAKLAND ISLANDS. A colony of the British crown, situated in the south Atlantic, 300 miles east of Magellan's Strait, consisting of: East Falkland, 2580 square miles; West Falkland, 2038 square miles; including in each case various adjacent small islands, about 100 in number. In addition to these are South Georgia with an estimated area of 1000 square miles, and other dependencies including the South Shetlands, the South Orkneys, the Sandwich group, and Graham's Land, together with all unknown seas and lands of the Antarctic Ocean extending as far as the South Pole. The estimated population in 1925 was 2252. In 1925 the birth rate was 17.70 per thousand and the death rate, 10.06. The chief town is Stanley, with 890 inhabitants in 1921. Education is compulsory. Sheep raising is the chief industry, although whaling is carried on with some success. In 1925 the imports were valued at £533,846 and the exports at £3,915,375. The chief imports were groceries, coal and coke, hardware and machinery; the chief exports, wool and whale produce. The revenue in 1925 was £220,881 and the expenditure, £126,928. Governor in 1927, Arnold W. Hodson.

FAMILY ENDOWMENTS. See CHILD WELFARE.

FAR EASTERN REPUBLIC. An independent state formed after the World War out of the former Russian provinces of Transbaikalia, Amur, the Maritime Provinces, and the northern part of the island of Sakhalin. After Nov. 10, 1922, the Far Eastern Republic became a constituent part of the Russian Socialist Federal Soviet Republic, and is now known officially as the Far Eastern region. Area, 652,740 square miles; population, about 2,000,000. Chita is the seat of the government.

FEDERAL COUNCIL OF THE CHURCHES OF CHRIST IN AMERICA. An organization established in 1908 by 28 Protestant denominations, to act for them in matters of common interest. At the end of 1927 it included most of the Protestant denominations of the United States, as follows: Baptist Churches, North; National Baptist Convention; Free Baptist Churches; Christian Church; Churches of God in North America (General Eldership); Congregational Churches; Disciples of Christ; Evangelical Church; Evangelical Synod of North America; Friends; Methodist Episcopal Church; Methodist Episcopal Church, South; African Methodist Episcopal Church; African Methodist Episcopal Zion Church; Colored Methodist Episcopal Church in America; Methodist Protestant Church; Moravian Church; Presbyterian Church in the United States of America; Presbyterian Church in the United States (South); Primitive Methodist Church; National Council of the Protestant Episcopal Church; Reformed Church in America; Reformed Church in the United States; Reformed Episcopal Church; Seventh-Day Baptist Churches;

United Brethren Church; United Presbyterian Church; United Lutheran Church (Consultative Body). Of these, all were full and official members with the exception of the United Lutheran Church, whose relationship was consultative, and the Protestant Episcopal Church, whose National Council cooperates in certain specified areas of work. The total number of local churches included in the constituency of the Federal Council was 147,252; number of clergymen, 116,044; total communicant membership, 22,455,594.

The Council, made up of members designated by the several denominations to act for them, meets quadrennially, the last meeting having been held at Atlanta, Dec. 3-9, 1924. It has an executive committee of about 100, meeting annually. An administrative committee, including one official representative from each of the denominations, meets monthly in New York. This committee includes representatives of other co-operative agencies carrying on specialized work for the churches, among them being the Home Missions Council; the Council of Women for Home Missions; the Council of the Church Boards of Education; the American Bible Society; the Student Volunteer Movement for Foreign Missions; and the International Council of Religious Education. The Council also serves as a connecting link between the church and great social agencies, such as the American Red Cross, the Child Welfare Movement, and the U. S. Bureau of Public Health.

Special tasks of the Council are carried on by a group of commissions. The Commission on Evangelism develops a united approach to the evangelistic work of the churches. The Commission on the Church and Social Service is the centre through which the churches deal unitedly with social issues. It gives particular attention to the developing of better relations in industry through conferences. The Department of Research and Education issues a weekly information service discussing contemporary social questions from the standpoint of Christianity and makes special studies from time to time, its outstanding studies in 1927 being a *Report on the Oil and Land Controversy between the United States and Mexico*, and *Social Aspects of Agricultural Credit*. The Commission on Church and Race Relations furthers efforts of churches in promoting coöperation and good will between the white and negro races in the United States. The Commission on International Justice and Good Will endeavors to mobilize the Christian forces to abolish war by building up effective international agencies for coöperation. During 1927 attention was given to supporting the proposal for renouncing war as an instrument of national policy. Other Commissions of the Council deal with the following subjects: Christian Education; Relations with Religious Bodies in Europe; Religious Work in the Canal Zone; Army and Navy Chaplains; Relations with the Eastern Churches.

One of the significant developments of 1927 was the initiation of the Church and Drama Association, organized for developing the co-operation of all religious forces in support of the worthiest productions on stage and screen.

The programme of the Council is carried on with funds contributed in part by individuals interested in the work and in part by appropriations from the various denominations. The official organ of the Council is the *Federal Council*.

oil Bulletin, issued monthly and furnishing general religious news. The officers, 1924-28, were: President, Rev. S. Parkes Cadman of Brooklyn, N. Y.; Chairman of Executive Committee, Bishop John M. Moore of Dallas; Chairman of Washington Committee, Bishop William F. McDowell; Chairman of Western Committee, Dean Shailer Mathews. National offices are at 105 East 22d Street, New York. There is a Washington office in the Woodward Building, and a Western office at 77 West Washington Street, Chicago. General Secretaries at the national offices are Rev. Charles S. Macfarland, Rev. John M. Moore, and Rev. Samuel McCrea Cavert.

FEDERAL RESERVE BANKS. See BANKS AND BANKING; FINANCIAL REVIEW.

FEDERAL TERRITORY. A territory of the Commonwealth of Australia, lying within the state of New South Wales. Area, 940 square miles; population according to the census of 1921, 2572; estimated June 30, 1926, 5522. The bulk of the territory was acquired by the Commonwealth from New South Wales in 1911, as the site of the new capital, Canberra; 28 additional miles were obtained in 1917 as the site for a naval college.

FEDERATED MALAY STATES. A group of states, constituting a large part of the Malay Peninsula, under the protection of Great Britain, comprising: Perak, with an area of 7800 square miles; population in 1921, 590,055; capital, Taiping; Selangor, 3156 square miles; population, 1921, 401,009; capital, Kuala Lumpur, the largest city in the federation with a population of 80,000; Negri Sembilan, 2550 square miles; population, 1921, 178,782; capital, Seremban; Pahang, 14,000 square miles; population, 1921, 146,004; capital, Kuala Lipis. The total area is 27,506 square miles; with a population in 1921 of 1,324,890, comprising 510,821 Malays, 494,548 Chinese, 305,219 natives of India, 5686 Europeans, and 3204 Eurasians. The males greatly outnumber the females (853,528 to 471,362), which is due to the large number of Chinese and Indian immigrants. The estimated population in June, 1926, was 1,476,032. The movement of population in 1924 was: Births, 39,512; deaths, 33,585. In 1925 there were 45 English schools, with an average enrollment of 11,194 boys and 2682 girls. Vernacular schools under the control of the education department numbered 1028 with an average enrollment of 52,789. There are many vernacular schools for the Chinese not maintained by the government.

The chief products include: Rice, coconuts, rubber, sugar, tapioca, pepper, gambier, and nipa palms. The main industries are the raising of rubber and the mining of tin. In addition to valuable timber, the forests produce resins, canes, gutta percha, etc. Besides tin, gold is mined extensively; other minerals found but not worked in quantities are lead, iron, copper, manganese, silver, zinc, plumbago, mercury, arsenic, and scheelite. At the end of 1925, 107,257 persons were engaged in the mining industry. The latest figures available on commerce are those given in the preceding **YEAR BOOK** when exports totaled \$715,818,000 and imports \$549,760,000, leaving a favorable balance of trade of \$175,058,000. This was largely due to the unusually high prices obtainable for rubber.

The revenue of the states in 1925 was £10,092,366 and the expenditures, £8,114,210. The public debt on Jan. 1, 1926, was £11,105,000.

The total railway mileage open to traffic was 1073 miles and the number of miles under construction in the same year was 116.

The states are under British protection and the British government is represented by the governor of the Straits Settlements who is *ex-officio* high commissioner for the Federated Malay States. High Commissioner in 1927, Sir Lawrence Nunns Guillemard.

FEDERATION OF LABOR, AMERICAN. See LABOR, AMERICAN FEDERATION OF.

FELTER, HARVEY WICKES. American author and editor of medical works, died at Cincinnati, Ohio, October 27. He was born at Rensselaerville, N. Y., June 15, 1865, and was educated at Lansingburgh Academy and in special courses at the University of Cincinnati. He received the degree of M.D. from the Eclectic Medical Institute of Cincinnati in 1888, and after a year spent in practice at Troy, N. Y., returned to Cincinnati, where he engaged in practice and in teaching at the Eclectic Medical Institute. He held several chairs and other positions, and was at the time of his death professor of medical history, materia medica and therapeutics. From 1904 to 1913 he was editor of the *Eclectic Medical Gleaner*, and after Jan. 1, 1913, was editor of the *Eclectic Medical Journal*, on whose staff he had previously served for many years. He was at one time president of the Cincinnati Eclectic Medical Society and the Ohio State Eclectic Medical Association, and was president of the National Eclectic Medical Association, 1920-21. He was a member of many other medical societies. He was interested in the Cincinnati chapter of the Wild Flower Preservation Society, being founder and editor of the magazine *Wild Flower*. He was also editor of Locke's *Syllabus of Eclectic Materia Medica and Therapeutics*, published in 1895, and the author of the following works: *King's American Eclectic Dispensatory* (revised and rewritten) (1898-1900); *History of the Eclectic Medical Institute* (1845-1902); and *Eclectic Materia Medica and Therapeutics* (1921).

FENCING. There was no competition for the Robert M. Thompson International Trophy in 1927, but the various championship tournaments held throughout the United States attracted more than ordinary interest. Only one national champion succeeded in retaining his title, this distinction going to Lieutenant George C. Calnan, U. S. N., in the foils. Harold Van Buskirk of the Fencers' Club, New York City, carried off the *épée* title while the sabre honors were won by Nikolas Muray of the New York Athletic Club. In the team championships, the New York Athletic Club won in the foils, sabre and three-weapon contests and the Boston Athletic Association was the victor in the *épée* competition. Yale University presented the strongest team in the intercollegiate championships, capturing one team title and two of the three individual crowns. Darnell Every won the foils title for Yale and Robert Nussbaum took the sabre laurels. Frank Sands of the Army was the victor with the *épée*. Yale won the sabre team competition; while Cornell triumphed with the foils and Army with the *épée*.

Miss Stephanie Stern of Offenbach, Germany, representing the Philadelphia Sword Club, won the women's foils title, capturing all ten of her matches. The junior foils laurels went to Miss Margaret Boyle of the Brooklyn Edison Club.

FERDINAND, VICTOR ALBERT MAINRAD. King of Rumania, died at Sinaia, the summer residence of the royal family, July 20. He was born at Sigmaringen, Prussia, Aug. 24, 1865, the son of Prince Leopold of Hohenzollern-Sigmaringen and Antonia, Infanta of Portugal. His uncle, Prince Charles, became the first King of Rumania, while his eldest brother kept the succession to the Hohenzollern-Sigmaringen principality. In view of the possibility of King Charles and Queen Elizabeth dying without issue, Prince Ferdinand was declared heir presumptive in March, 1889. On Jan. 10, 1893, he married Princess Marie, the eldest daughter of the late Duke of Edinburgh, and granddaughter of Queen Victoria and also of Czar Alexander II. Prince Ferdinand made his home in Rumania from the time of his adoption as heir and became very fond of his adopted country. Prince Carol, the eldest of his six children, was born Oct. 3, 1893, and married in 1921 Princess Helen of Greece; their son, Prince Michael, was born in the following year. At the time of the outbreak of the World War in 1914 Charles I, King of Rumania, and Queen Elizabeth, known also as Carmen Sylva, did not resist the French influence; Premier Bratianu also sympathized with the Allies and announced a policy of neutrality which the council declared.

Upon the death of King Charles, Ferdinand ascended the throne, Oct. 11, 1914, and for nearly two years neutrality was maintained, the sympathy of Queen Marie being with the Allies and the general sentiment of the country favoring such an alignment. On Aug. 26, 1916, King Ferdinand summoned his ministers, his party leaders, and Crown Prince Carol into a council, and announced that notwithstanding he was a Hohenzollern he must decide in favor of the Allies on the score that the Rumanian state must be considered first, and called for united support. During the War, in the course of which four-fifths of the country was overrun by German and Austrian armies, the King and Queen gained a permanent place in the hearts of their people. The King shared the hardships of his troops and of the population generally, and even the defection of the Russians, subverted by Bolshevik propaganda, only brought about greater efforts. His army at the battle of Marashesti withstood the Austro-German attack with courage.

During the War his troops suffered heavy casualties, and the resources of the country were exhausted, notwithstanding the aid furnished by the Allies. Both the King and the Queen strongly held out against making peace with the Austro-Germans, but he was forced to agree to an armistice on Dec. 7, 1917. Nevertheless, he did not sign the treaty of Bucharest, May 7, 1918, which took from Rumania a strip of territory along the Carpathians including all the passes, the valley heads, observation posts, the "Iron Gate" of the Danube, and rich oil concessions. This treaty was signed by the prime minister under compulsion, but King Ferdinand, fleeing through mountains and forest, was able to evade acknowledgment of the document. The terms of this treaty would have deprived Rumania of all defenses in any future trouble with the Central Powers, and indicated in a general way the real ambitions of the Germans in the World War.

The triumph of the Germans, however, was comparatively short lived, as the attack of the Allies on the Western front caused the Germans to withdraw their forces from Rumania in an unsuccessful effort to meet the offensive. After the armistice of Nov. 11, 1918, King Ferdinand demanded the evacuation of his country by the enemy forces, and on Dec. 1, 1918, at the head of the remnant of his army he entered Bucharest in triumph. In the meantime the Allies, through the action of a secret treaty made in 1916, transferred from Russia and Hungary to Rumania important and extensive territory, including parts of the Banat, Bukowina and Transylvania, and Bessarabia was added to Rumania. King Ferdinand in 1919 had sanctioned an expedition into Hungary which had been provoked by the aggression of Bela Kun, the Hungarian Bolshevik, and the King's army entered Budapest in August, 1919. He demanded reparation from Hungary on a more ample basis than was given under the terms of the armistice. On Oct. 15, 1922, King Ferdinand and Queen Marie were crowned King and Queen of Greater Rumania at Alba Julia, where in 1601 the union of all Rumanians had been proclaimed by Michael the Brave.

From this time King Ferdinand had a severe and, on the whole, a thankless task in his efforts to serve the country as a whole and promote agrarian reforms and the cause of universal suffrage. He was the first to surrender large parts of his estates to be divided for the benefit of peasant proprietors, and he advocated the granting of full civil and political rights to the Jews. He had many political worries, and the conduct of his eldest son, Prince Carol, was a source of serious concern both to his parents and to the state. At the height of the War, Carol left the army and eloped with a Rumanian girl with whom he contracted a morganatic marriage. This marriage subsequently was annulled by both state and church, and the Crown Prince was convicted as a deserter and sentenced to 75 days in prison. Later a number of points of difference with his father developed, and in 1925, indulging in another escapade, Carol renounced all his rights of succession. Accordingly, on Dec. 31, 1925, King Ferdinand summoned a crown council at Sinaia, in which he announced the surrender of the rights and prerogatives of the crown prince and proposed as the heir to the throne the little Prince Michael.

On Jan. 4, 1926, an act of succession was passed by a special session of Parliament, providing for a council of regency to be composed of the King's second son, Prince Nicholas, the patriarch of Rumania, and the president of the court of cassation. To add to these troubles of the King, further domestic difficulties befell his daughter, whose husband, King George of Greece, had been deposed from the throne. In his earlier years King Ferdinand was a keen sportsman. In the autumn of 1926 he suffered a serious breakdown, and his disease was diagnosed as caused by a malignant internal growth, with slight prospects of cure or improvement. His consort, Queen Marie, visited the United States during the autumn of 1926, but was forced to return to her husband owing to the rapid development of his disease. In May the King was moved from the capital to his palace at Sinaia. Notwithstanding the efforts of various

specialists, he declined in health. In his last illness he rallied long enough to confirm by his signature the documents involved in the Parliamentary elections. The final cause of death was pneumonia. See RUMANIA.

FERTILIZERS. Accurate figures for the consumption of fertilizers during 1927 were not available at the end of the year. It was estimated that the United States used 7,500,000 short tons of fertilizers annually. This represents little increase in tonnage in recent years, but probably some increase in actual plant food, due to the higher grade of fertilizers now used in America. Other countries, especially certain European countries, were increasing their consumption of fertilizers and were far ahead of the United States in per acre use. The use of fertilizers was also extending to regions which had not heretofore felt the need or economic advantage of using them.

Figures published by the U. S. Department of Commerce indicated that both imports and exports of fertilizing materials as a whole decreased during the year 1927, although this was not true of certain materials. Exports of ammonium sulphate declined and imports increased. Exports of phosphate rock and superphosphate increased. There was a sharp decline in imports of sodium nitrate and potash salts.

Relatively low prices prevailed in the United States for fertilizers as compared with prices of other commodities and farm products. The spring prices of fertilizers were stated to be only 6 per cent above the pre-war level, while the general commodity level was 46 per cent above and of farm products 26 per cent above the pre-war level.

Representatives of fertilizer manufacturers and dealers took steps during the year to secure the general adoption of a code of trade practices calculated to eliminate waste and unfair practices and stabilize prices, which should greatly benefit the fertilizer business. The fertilizer business as well as users of fertilizers should also be benefited by the continued efforts to reduce the number of grades offered for sale and by a recent proposal to adopt a uniform method of stating fertilizer analyses.

As a result of recent developments in fixation of nitrogen and other improvements in fertilizer manufacture, highly concentrated fertilizers, such as ammonium nitrate, ammonium phosphate, ammonium chloride, urea, and various others were being produced. The value of many of these materials as fertilizer had been established and they were appearing on the market in considerable quantity. They had been shown to compare favorably with the more commonly used fertilizing materials, such as sodium nitrate, ammonium sulphate, and superphosphate. Germany had taken the lead in this development, but France, England, the United States, and other countries were taking steps in the same direction. It was stated that England expected to become self-sustaining as to its supply of combined nitrogen by supplementing its large ammonium sulphate industry with the nitrogen fixation process. It was claimed that Germany was able to produce nitrogen in form of air nitrogen compounds for less than nitrogen was selling in the United States.

Competition of the synthetic products had caused the Chilean nitrate interests to give more

serious attention to improving methods and reducing the cost of preparing their product for the market. It was reported during the year that the cost of production of marketable Chilean nitrate had been reduced 50 per cent by the introduction of the Guggenheim and Prudhomme processes of extraction, thus making the working of poorer beds profitable. E. V. Wilcox, after studying the situation at first hand, stated, "I believe that Chile will continue to produce nitrate at a profit, but that her monopoly of the industry is definitely broken and that hereafter she will have to divide the business with the producers of other kinds of nitrogen."

The price of nitrate was reduced approximately \$9 per ton during the year, and unlimited export was permitted by the Chilean government after July 1, 1927. Speaking of these changes in policy, a representative of the Chilean Nitrate Producers' Association said: "The abrogation of the twenty-five-year-old agreement limiting the amount of nitrate exported from Chile will permit the delivery of large quantities at reduced prices. In addition, the development of new processes of nitrate extraction is achieving a radical reduction of cost. Without doubt world consumption, and particularly United States consumption, will expand in response to these factors." A substantial increase in sales for delivery after July 1 appears to have been the response to the change in policy.

The status of Muscle Shoals as a factor in the production of synthetic nitrogen compounds remained undetermined. Three main proposals were before Congress when it assembled in December. One provided for leasing of the project to the Air Nitrates Corporation and the American Cyanamid Company, another proposed leasing to the Farmers' Federated Fertilizer Corporation, and a third recommended the appropriation of \$150,000,000 and government operation of the project. Recent discussion of this project dealt largely with its utilization for power production with incidental use for the production of fertilizers.

The price of potash advanced 9.5 per cent during the year, and there was evidence of strengthening of the monopoly which controlled the world's supply of this essential ingredient of fertilizers. The world was still dependent upon the potash deposits of Germany and France for 95 per cent of the potash it needs, despite renewed and widespread efforts to develop other sources, stimulated by the advancing price of the European product.

The United States was making some progress in developing its domestic potash resources, but was still dependent upon Europe for fully 75 per cent of the potash it used. Progress was made in the United States in developing chemical processes for recovering potash from various potash-bearing minerals and trade wastes of which there is an abundant supply. The practicability of recovering sufficient potash from available home resources was demonstrated. The immediate problem was that of perfecting methods and rendering the processes economic. Continuing the development of the commercial possibilities of natural deposits of potash salts, active operations with a considerable output were going on at Searles Lake, California, which was estimated to have a potential supply of 30,000,000 tons of potash. The explorations of the U. S.

Geological Survey and the Bureau of Mines in Southwestern Texas and Southeastern New Mexico, for which Congress made an appropriation of \$100,000 a year for five years, continued to give encouraging results. An area of 60,000 square miles was under observation and had been partly explored. Beds of potash salts richer and in some cases at less depth than those of Germany, but not so rich as those of Alsace, had been found. Crude salts containing as high as 18.5 per cent of pure potash were reported. The thickness and extent of the beds have, however, not been adequately determined.

Italy was especially active in search for new sources of potash. Investigations of Spanish deposits discovered some years ago indicated them to be of considerable potential value, but there was little progress in developing them. The possibility of commercial extraction of potash from the waters of the Dead Sea was recently exploited. It was stated that there appeared to be no insuperable technical difficulty in producing 100,000 tons of potassium chloride annually from the sea waters, using natural evaporation, but the commercial possibilities of the undertaking had not been definitely determined and the commercial feasibility appears doubtful.

The U. S. Department of Justice brought suit during the year to prevent the German and French potash interests from entering into agreements or setting up selling agencies in this country which might be violative of the anti-trust laws of the United States. The prosecution of this suit was complicated by the fact that the French and German potash producers were closely allied with their respective governments, and action in the matter was delayed.

Pending litigation or satisfactory adjustment of the matter, the importation and sale of potash in the United States was allowed to proceed without interference.

The imports of potash into the United States for 1927 amounted to 623,109 tons, valued at \$13,423,925, as compared with 815,714 tons, valued at \$14,122,699 in 1926, indicating a falling off in quantity but a marked increase in cost to the American consumer. For discussion of world production in 1927, see POTASH.

The United States exported 107,462 tons of superphosphate valued at \$1,613,854 during the year ending Dec. 31, 1927, as compared with 64,452 tons valued at \$937,278 during 1926. The exports of rock phosphate during 1927 amounted to 918,256 tons valued at \$4,733,174 as compared with 748,963 tons valued at \$4,435,590 in 1926. The imports of phosphatic materials amounted to 101,815 tons valued at \$2,102,395 in 1927 as compared with 68,710 tons valued at \$1,661,914 in 1926.

A proposal to substitute "superphosphate" for "acid phosphate" to designate the fertilizing material resulting from the treatment of insoluble phosphates with acid to render the phosphoric acid more available received favorable consideration during the year and was tentatively approved by the Association of Official Agricultural Chemists. The term was first used for the purpose indicated by Sir John Lawes in 1842 and is generally used except in the United States. See CHILE.

FESTIVALS. See MUSIC.

FEUSTMAN, LYON PHILIP. American engineer and manufacturer, died in New York City,

April 7. He was born at Philadelphia, Pa., in 1861, and was educated in the public schools of that city and the University of Pennsylvania, from which he was graduated in 1882. His first employment was as a chemist at Leadville, Colo., where he remained for six years, and in 1888 he went to Mexico for the Consolidated Smelting and Refining Company, later becoming resident manager for that company's interests in Mexico. In 1900 he went to New York City having served as resident manager for the Guggenheim interests of Mexico, and continued with these properties until 1903, when he became vice president of the Power and Mining Machinery Company. In 1907 he was made vice president and general manager of the International Steam Pump Company, with which the Power and Mining Company was combined, and later, when the company was reorganized as the Worthington Pump and Machinery Corporation, Mr. Feustman held the same position in the new organization. He was active in the development of the first American Diesel engines, some of which were installed on vessels of the United States Shipping Board. He was a member of the American Institute of Mining and Metallurgical Engineers and other organizations.

FIELD, JAMES ALFRED. American economist, died at Boston, Mass., July 16. He was born at Milton, Mass., May 26, 1880, and after graduating from Harvard in 1903 took post-graduate work there and at the University of Berlin. He was assistant in economics at Harvard University, 1903-04, Austin teaching fellow in economics, 1904-05, instructor, 1906-08, and instructor in economics at Radcliffe College, 1906-07. In 1908 he went to the University of Chicago as instructor in political economy, becoming assistant professor in 1910, associate professor in 1913, full professor in 1918, and dean of the College of Arts and Literature, 1923-24. He was associate editor of the *Journal of Political Economy*, special investigator for the division of statistics of the Council of National Defense in 1917, and chief statistician of the American Shipping Mission and the Allied Maritime Transport Council at London, 1918-19. He was a fellow of the American Statistical Association and a member of the American Economic Association. His works include: *The Progress of Eugenics* (1911); (joint author) *Outlines of Economics* (1910); and *Materials for the Study of Elementary Economics* (1913).

FIELD ATHLETICS. See ATHLETICS, TRACK AND FIELD.

FIJI ISLANDS. A British crown colony, comprising a group of islands in the South Pacific about 250 in number (some 80 inhabited). Area, 7083 square miles; population at the census of 1921, 157,266, of whom 84,475 were Fijians, 60,634 Indians, and 3878 Europeans. The largest island is Viti Levu (4053 square miles) and the next Vanua Levu (2130 square miles). The capital, Suva, on the south coast of Viti Levu, had a European population (including suburbs) of 1741. Coconuts, sugar cane, rice, tobacco, tea, tropical fruits, beans, sisal, and hemp are the principal products. Horses, mules, cattle, sheep, goats, and pigs are raised. No later

figures for trade are available than those for 1925 when the exports were valued at £2,156,257 and the imports at £1,271,135. The revenue in 1924 was £488,906; expenditure, £451,257; public debt, £359,200. The total tonnage which entered and cleared in 1924 was 799,214 tons of which 690,076 were British. A privately owned small-gauge railway of 120 miles runs from Tavua to Sigatoka. The executive power is vested in a governor, appointed by the crown, aided by an executive council and a legislative council of which the governor is president. The governor is also High Commissioner for the Western Pacific. Governor in 1926, Sir Eyre Hutson, K.C.M.G., appointed 1925.

FILDES, SIR LUKE. British painter, died at London, February 27. He was born at Liverpool, England, Oct. 18, 1843, or, according to some accounts of his life, in 1844. He was educated at a private school, and studied art at the South Kensington Art Schools and the Royal Academy School. For some years he devoted himself mainly to book and magazine illustration; among his works was a set of illustrations for the story which Charles Dickens left unfinished, *The Mystery of Edwin Drood*. Passing from illustration to work in oil, Fildes exhibited in 1872 his first picture in that medium, "Fair, Quiet and Sweet Rest." It attracted favorable notice, and "The Casual Ward," shown two years later, established his reputation as a painter of the life of the suffering poor of London. The most popular of his paintings is "The Doctor," which depicts a physician watching intently at the bedside of a sick child; it has been reproduced many times. In painting the portrait of his wife, Fildes discovered his talent as a portrait painter. Among his sitters were King Edward VII and Queen Alexandra (1901), and King George V (1912), for state portraits. His vividly colored pictures of street scenes in Venice are well known and have been reproduced frequently. He was honored by election to the Royal Academy in 1887, by knighthood in 1906, and by creation as a Knight Commander of the Victorian Order in 1918.

FINANCE. See PUBLIC FINANCE.

FINANCIAL REVIEW. Contrary to the tendencies to be noted in American business conditions during the business year of 1927, the financial year showed exceptionally satisfactory and prosperous developments. Speculation was active and prices of securities were high. The loanable funds were abundant and new issues were not only placed on the market in large amount, but were very readily taken. The volume of funds disbursed as interest and dividends was unprecedentedly large. General conditions were exceptionally satisfactory from the technical speculative standpoint, the market showing an unusual degree of stability with remarkable "support" for securities of almost all descriptions.

STOCK EXCHANGE OPERATIONS. New York Stock Exchange operations for another year recorded a very high level of turnover, the aggregate number of shares transferred during the year being 577,000,000, while the total volume of bonds transferred was \$3,321,000,000 par value. During the year, the extreme breadth of trading gave rise to a number of exceptionally heavy sessions of the New York Stock Exchange, the total being 145 1,000,000 share days and three

3,000,000 share days in the course of the twelve-months. Active business naturally advanced the price of Stock Exchange seats which rose, toward the close of the year, to a level of about \$310,000. Prices on the Exchange, in the main, held their own unexpectedly well notwithstanding that the year had opened with the general level already very far advanced. An index of 50 representative shares showed at the high point of the year a combined average of 185.47 on October 4 as compared with a low of 135.82 near the opening of the year, on January 27, while a similar index of 50 representative bonds showed a quotation of 92.98 at the high point on December 1, as compared with 89.47 at the beginning (January 3).

While there were some broad fluctuations during the year with tendency to depression at one or two periods when credit had become overstrained, the general outcome was such as to maintain values with an uncommon degree of steadiness and it was currently noted by brokers that there had been evidence of an unusual degree of support on all occasions when distinct reaction in favorite shares took place. Good business during the first six months of the year tended strongly to maintain the general level of stock prices, while some exceptional dividend distributions, such as the 40 per cent stock dividend of U. S. Steel, likewise helped to keep values up. Unusual business profits in the case of a few concerns, such as General Motors and certain of the companies allied with it, succeeded in helping the generally strong tendency up to the end of June. During the second half of the year, exceptionally easy money with a 3½ per cent rediscount rate at the Federal Reserve banks, and a very large amount of interior bank funds in the New York market for lending on call, likewise tended to maintain the level of prices that had already been scored during the first half of the year.

Reaction in some industries, illustrated by poor railroad earnings, tended to reduce quotations in those departments during the last quarter of the year, a situation which was prevalent particularly in the coal and oil groups of shares. This, however, was partly offset by improvement in certain other groups, such as the coppers which were aided by distinct advances in the price of copper metal, and in a number of the public utilities which were likewise unusually prosperous. Toward the close of the year, the increasingly poor showing among industrial earnings at large was a depressing factor, while an element of strength was found in the unusual number of extra dividends or dividends at a higher rate which were declared by a very widespread group of companies drawn from many different lines of industry.

It should be added that the last quarter was also witness to depression in the prices of some industrials and particularly of certain companies, due to reduction or passing of dividends, although these instances were decidedly less numerous than those of increase or extra distribution. A factor which tended to emphasize the larger distribution of funds was found in the opinion, widely entertained, that Congress was likely to adopt a measure for the taxation of undistributed surpluses.

NEW ISSUES. New issues during 1927 proved to be exceptionally numerous, both of foreign

and of domestic securities. There was also unusual activity in refunding and in remodeling the capital structure of various corporate enterprises which had retained the power to call in old outstanding issues of stocks and bonds. This activity was the direct result of the lowering of rates of interest which as always tended to raise the value of existing fixed rate issues and thus to enable borrowers to get funds at decidedly more economical figures than had previously been feasible. The fact that a great many concerns were already well financed and did not find it necessary to enter the market left the field comparatively clear for new flotations embodying in many cases the results of mergers, reorganizations, and undertakings of kinds which, in some instances at least, had not previously been deemed eligible for corporate organization. Additional to these elements in the case was the fact that in many instances railroads, which, as is well known, had for a long time past been unable to place stock on the market and had financed themselves largely through the issue of bonds, found it needful to obtain funds for new construction and succeeded in doing so by placing on the market either common or preferred shares.

According to the compilations of the *Journal of Commerce* of New York, the new and refunding issues of 1927, classified by type of issue and arranged to show division of the securities as among industries, were as shown below in the accompanying table.

Dividends on industrial shares, as reported for the year, were \$1,585,475,000 as compared

with \$1,189,550,000 in 1926, while steam railroad and traction dividends were \$474,800,000 as compared with \$439,810,000 during the preceding year. The year was characterized by a very large number of extra and stock dividends. Studies made on this subject showed a total number of extra dividends in the course of the year amounting to not less than 500.

Special attention should be given to issues of foreign securities in the American market during 1927. According to private estimates, the total volume of such issues, including both long and short term securities, was above \$2,000,000,000, while bonds alone accounted for about \$1,644,000,000 of this sum. The issues were made in behalf of governments and firms in all parts of the world but about \$885,000,000 represented European issues, while about \$122,000,000 originated in Central American countries and \$475,000,000 in Canada. While these issues were generally made at a necessarily higher rate than was borne by domestic issues, many of them represented loans of satisfactory character and in other cases the bonds, although open to doubts arising out of the political surroundings of the issuers, were in other respects of high grade character. The steadily increasing volume of such issues, however, naturally involved anxieties with respect to the balance of trade and the possibility of collecting the indebtedness as time passed and obligations matured. The table on the following page, issued by the Department of Commerce in August each year for the year preceding represents the so-called "balance sheet of the United States".

NEW AND REFUNDING SECURITY ISSUES, 1927 AND 1926
(Grand totals exclude real estate issues)

	1927	1926	Change
Railroads:			
Bonds	\$685,406,500	\$267,732,000	+ \$417,673,500
Notes	100,102,000	83,562,000	+ 16,540,000

^a Not an export. Entered in credit column as a deduction from the merchandise debit.

^b Net sum (compiled and estimated) made available in foreign countries on account of publicly offered and privately taken foreign loans and direct American investments abroad, after deductions for refunding, for underwriters' commissions and for bond discounts.

^c Some of these foreign securities are known to have been acquired earlier in 1926; so they are not exclusively "previous American investments abroad."

^d Observe that imports (receipts) of gold and currency appear in the debit column, while all other entries in the debit column are, predominantly, cash payments; the credit column contains similarly divergent entries.

MOVEMENT OF GOLD. During the year 1927, movements of gold into and out of the United States and into and out of our ownership continued to be unusually large. The Secretary of the Treasury estimated the changes of ownership at close to \$500,000,000 (combined exports and imports including ear-marked gold) al-

though the net result of the year's operations was to cut the supply of gold on hand by only about \$151,000,000. The gold actually shipped abroad was sent in some considerable measure as a result of arrangements for the supplying of specie for bank reserves in countries where stabilization of currency or restoration of the

gold standard was under advisement, while in other cases the shipments grew out of differences in the exchange position which made it profitable to send gold simply as a matter of business routine. A good deal of gold was sent to the Orient, including India and the Dutch East Indies as points of destination while still more was sent to England, Holland, the Scandinavian countries and others. Mr. Mellon, Secretary of the Treasury, in his annual report referred to the credits negotiated with foreign countries with the reserve system as being an important cause of the gold movement. Among such credits were those promised to Poland, Italy, one or two of the South American countries, and to France on a tentative basis, while there had already been commitments to England, Belgium and several other countries. In the following table the distribution of gold exports is briefly reviewed:

FOREIGN GOLD

[Shipments definitely known as reported by the Federal Reserve Bank since Jan. 1, 1927, to Dec. 31, 1927. (000 omitted)]

Country	Imports	Exports	Balance
Argentina	\$61,390	\$61,390 ^a
Belgium	1,000	1,000 ^a
Brazil	34,175	34,175 ^a

Uruguay	2,000	2,000 ^a
Not stated	13,316	10,257	3,059

^a Excess of exports.

COMMODITY PRICES. The principal commodity prices during the year 1927 followed a rather more favorable course than in the preceding year, especially in so far as they represented agricultural commodities. Wheat which had seemed early in the year to be in danger of turning out a short crop actually did produce (taking winter and spring combined) about the same amount as in the previous year, but the product was better distributed and prices maintained a more regular course with lessened fluctuation though better on the whole for the farmer than in any recent crop season. Wheat (No. 2 red) was however quoted at the close of 1927 at approximately \$1.40³/₄ @ \$1.50³/₄ a bushel (Chicago) while at the opening of the year the price was approximately \$1.53³/₄. Cotton on the other hand was decidedly above the level of 1926, due to the decided shortening of crops which had occurred and was also very much less erratic and fluctuating in its movements. At the opening of the year the quotation of middling upland had been approximately 13c. a pound, but this figure was raised to 20c. at the close of 1927 while the carryover had been distinctly reduced through substantial mill buying in addition to the shortening of the actual output.

The year was also favorable from a price

standpoint in connection with animal industry. Family beef which had been \$22 a hundred pounds at the opening of January was quoted at \$33 at the end of the year although mess pork which had been quoted at \$35.50 a hundred at the beginning of 1927 was \$32 @ \$34 at the close. Similar changes occurred in other phases of the farming industry. On the other hand prices of imported commodities such as rubber, sugar, coffee, and the like, showed distinct tendency to decline, as the result in part of changes in foreign methods of control of values, but also as the result of changes in domestic demand, the automobile industry for instance being decidedly a less heavy buyer than had been the case during 1926.

FOREIGN EXCHANGE. Due to the efforts at stabilization which had been vigorously prosecuted by a number of countries during 1925 and 1926, the 12 months of 1927 were a period of very much less disturbance in the foreign exchange field than had been true on any recent occasion. There was a smoothing out of the curves of exchange quotations and a lack of speculative excitement which had not prevailed, for a long time. Interest of course naturally centred around the French franc, in the European field, there being doubt as to whether the Poincaré government would be able to stick to its policy of holding the quotation level. Substantial success was however attained in its effort, the franc varying during the year not more than five points between highs and lows for the entire 12 months, starting early in 1927 at about 3.03c. and closing the year at 3.04c. Marks, under the policy of pegging which was still pursued by the reparations authorities in Berlin, showed at no time any material change in quotations. Italian lire which had manifested in the spring of the year a considerable disposition to erratic fluctuation with a low of about 4.21c. were artificially pegged at a figure around 5¹/₂c. at about the end of June. Later on the Mussolini government announced its adherence to a plan of complete stabilization with the lira rigidly maintained at 5¹/₂c. Actual quotation at the end of December was 5.28c. Temporary stability had thus been insured but time had not yet been afforded for a complete test.

Polish exchange which had been erratic in the early months of the year tended to become quieter and firmer after the more or less successful flotation of the Polish loan on an international basis during the spring of 1927. British sterling tended to be weak during the early months of the year, ruling around \$4.85, but gradually increased in value until toward the close of December it reached a level which made the gold exports from the United States fairly worth while, with a quotation of \$4.88 at the end of December.

Dutch exchange ruled strong, practically throughout the entire 12 months, Holland succeeding in restoring in part her gold circulation and exacting gold from the United States toward the end of the year. The final quotation of the guilder was 41.50c. as against 39.99c. twelve months earlier.

Scandinavian quotations were relatively inactive and steady with a tendency to the movement of gold into both Norway and Denmark.

In the South American field the notable event of the year was the preparation for stabilization of the Brazilian milrêis around a quotation of

11.87½ cents with the aid of substantial exports of gold from the United States. The most interesting development in the Oriental field was the effort to give greater stability to the Japanese yen as recovery from earthquake conditions steadily proceeded and as actual progress was made towards overcoming the effects of the serious epidemic of bank failures during 1926. The yen however continued to fluctuate and reached a quotation at the close of 1927 of 46.44 cents as against 48.77c at the opening of the year.

Indian rupees showed decided strength practically throughout the year, while preparations for currency reform in India tended to draw specie from abroad. The quotation of the rupee at the close of December was at 36.87c (cables) as against 30.60c at the beginning of the year.

In general the status of exchange conditions at the close of the year was regarded as far more normal and satisfactory than for a long time past although the outcome of the French elections in the spring of 1928 was naturally awaited with some anxiety because of the possible change in party control which might be produced at that time.

MONEY RATES. The year 1927 was a year of exceptionally low money rates and generally "easy" money. So far as Reserve banks were concerned, the same stability which had been characteristic for a couple of years continued to prevail. The rate at all Federal Reserve banks except New York was 4 per cent from Nov. 3, 1925, to July 28, 1927, inclusive. The New York Bank maintained a 4 per cent rate except for the period Apr. 23, 1926 to Aug. 12, 1926 inclusive, when a 3½ per cent rate was effective. Shortly after the change in rate had been effected by the Reserve Bank of New York on July 28, 1927, cuts to the same level were made throughout the system, the first reduction in line with that of New York being at Kansas City on July 29, while the last to fall in line was Minneapolis on September 13.

The effort made by the Federal Reserve Board to enforce a general cut in rates aroused very widespread dissatisfaction throughout the Reserve system and gave rise to the impression that there was a concerted effort to force down rates throughout the country. This was sharply denied. Out of the controversy grew the general discussion of rates which occupied financial attention during the remainder of 1927. In the course of the discussion, D. A. Crissinger, Governor of the Federal Reserve Board, retired from office and was succeeded by R. A. Young, formerly Governor of the Reserve Bank of Minneapolis. In defense of the low rates in the United States, it was contended that they were necessary to protect the interests of the Bank of England and assist its effort to move steadily toward the reestablishment of the gold standard. In criticism of the low rediscount rates was cited the fact that their tendency was to enlarge unduly stock market speculation and to bring about an unwarranted expansion of bank credit.

Rates in general likewise showed stability. The call rate fluctuated between 3½ and 4½ per cent throughout most of the year, and the efforts of the money committee of the Exchange were generally directed toward equalizing the supply of brokers' loans in the market, and to offset withdrawals from the interior, by providing for additions originating with New York banks. Fluctuations beyond the limits named

were accordingly temporary although a figure of 5 per cent was reached in December and a figure of below 3½ had occasionally been touched in midsummer. Throughout the country at large, rates continued easy, with comparatively little change during most of the year. Farmers on the whole found borrowing rather cheaper than in the past and the maintenance of a low rate of interest at western Reserve banks was defended on the ground that it was helpful to the agricultural population in moving crops. Rates as stated by the Federal Reserve Board for interior centres however were steadily high if (as already pointed out) not as high as in former years. According to the Board's compilations, they varied from 4½ to 8 per cent.

In the agricultural territory, some disturbance was caused as a result of misfortune attending three Farm Land banks, headed by the Kansas City Joint Stock Land Bank. These difficulties naturally led to the growth of an impression that farm loans were less reliable than formerly, and consequently to some tendency to an increase in rates. These, however, were sporadic and relatively minor movements. In the investment field, the actual yield in bonds and preferred stocks tended steadily to decline and at the end of the year was seldom more than 4½-5 per cent for securities that were regarded as favorites or especially sound. Bonds had been high at the opening of the year but, if anything, continued to advance somewhat and on the average to yield a lower rate of return as the season advanced. Preferred stocks and the better grades of common stocks in some cases reached unprecedented figures toward the close of the year. Without any definite change in business prospects which would warrant such increases. The alteration was accordingly attributed to changes in the investment value of money, as a reflex of the very low rediscount and call rates which had been established in the Reserve system and in the open market. In fact, the prevailing ease and abundance of bank loans was by many reckoned the outstanding feature of the year's operations.

FINE ARTS. See PAINTING AND SCULPTURE.

FINK, BRUCE. American botanist, died at Oxford, Ohio, July 10. He was born at Blackberry, Ill., Dec. 22, 1861, and graduated from the University of Illinois with the degree of B.S. in 1887. From 1887 to 1892 he was principal of various high schools, and in the latter year became professor of biology in Upper Iowa University, where he served until 1903. In the meantime he had received the degrees of M.S. from the University of Illinois in 1894, A.M. from Harvard University in 1896, and Ph.D. from the University of Minnesota in 1899, and had carried on research work at the University of Chicago in 1903. He was professor of botany at Grinnell College, 1903-06, when he went to Miami University in the same capacity, holding that chair at the time of his death. He was a member of the Minnesota Botanical Survey, 1896-1903, and in 1906 was in charge of botany at the University of Washington Marine Station. He was associate editor of *Micologia* from 1903, president of the Sullivant Moss Society, president of the Iowa Academy of Science in 1904, president of the Ohio Academy of Science in 1912,

and a member of many learned and other societies. He was the author of: *Töbacco*, a book on the tobacco problem which passed through four editions; *The Lichens of Minnesota* (1910); *Laboratory Exercises in Plant Physiology and Ecology* (1911); and many botanical papers, including a series on the classification and nature of lichens. He was botanical editor of the *Ohio Journal of Science*, and was engaged at the time of his death on a manual of the lichens of the United States.

FINLAND. An independent republic of Europe; formerly a grand duchy of the Russian Empire; an independent republic since 1917; bounded on the east by Russia, on the north by the Arctic Ocean and Norway, on the west by Sweden and the Gulf of Bothnia, and on the south by the Gulf of Finland. Capital, Helsingfors.

AREA AND POPULATION. The total area exclusive of water is 132,642 square miles; population, according to the census of 1920, 3,364,807; estimated Dec. 31, 1925, 3,526,359. In 1925 the rural population made up 83 per cent of the total. The movement of population in the same year was: Births, 78,260; deaths, 47,493; marriages, 22,103; emigration, 2490. The principal towns with their populations in 1925 were: Helsingfors, 211,691; Åbo, 61,031; Tammerfors, 51,717; and Viborg, 48,367. The Evangelical Lutheran religion is that of the national church to which the bulk of the population belongs, but freedom of worship is granted to all.

EDUCATION. For elementary education there were (1925) in the country 4434 elementary schools, with 228,801 pupils; 1710 lower elementary schools, with 54,612 pupils; and 867 infant schools under the superintendency of the church with 95,035 pupils. In the towns there were 1352 classes of higher elementary schools, with 41,842 pupils. For secondary education there were 112 lycées, leading to the university, with 2293 teachers and 34,230 students; 61 middle schools with 569 teachers and 8396 pupils; eight training colleges for elementary school teachers, with 117 teachers and 1521 students; six for infant school teachers, with 460 students; 52 high schools for the people with 341 teachers and 2492 students. There are three universities: One at Helsingfors with 298 teachers and 3319 students in 1926; two at Åbo; one Swedish, with 33 teachers and 157 students; and one Finnish, with 23 teachers and 188 students. There is also a great variety of agricultural, horticultural, forestry, industrial and other technical schools. In 1920 only 0.7 per cent of the persons who had reached their fifteenth year could neither read nor write.

PRODUCTION. Agricultural pursuits form the chief occupation of the people of Finland, although the cultivated area only covers 6.1 per cent of the land. The principal crops of 1925 were as follows: Rye, 578,846 acres, yielding 347,575 tons; barley, 271,587 acres, 140,802 tons; oats, 1,072,414 acres, 586,559 tons; potatoes, 166,772 acres, 723,138 tons; hay, 2,447,186 acres. The butter production in the same year was 17,905 tons. The total land under cultivation was 5,269,511 acres. The livestock census in 1925 showed 401,664 horses, 1,870,603 horned cattle, 1,451,084 sheep, 11,767 goats, and 378,383 pigs. The forests are a great source of wealth, Finland being better off in that respect than any country in Europe except Russia. Fin-

land had, in 1925, 3217 large factories, employing an aggregate of 114,005 workers, and yielding an aggregate product of 10,126,000,000 marks. The three leading groups from point of view of output were wood industries, paper factories, and iron and mechanical works.

COMMERCE. No later statistics on commerce were available for individual items than those given in the preceding *YEAR BOOK*. Imports for 1926 totaled 5,659,600,000 Finnish marks and exports 5,633,300,000, reversing a balance of trade which had been favorable in 1924 and 1925. The leading imports were cereals, colonial produce and spices and metals; the leading exports, timber, pulp and paper, and food obtained from animals.

FINANCE. Closed accounts of the state budget for 1926, including the supplementary estimates, disclosed a balance slightly above the estimated budget. The final returns totaled 4,076,600,000 marks against the estimates of 4,017,700,000 marks. Ordinary revenues were higher by nearly 100,000,000 marks and extraordinary by nearly 9,000,000 marks. The final balance was accomplished through resort to loans and also to the treasury reserve, but the amount taken from the latter was lower by 38,000,000 marks. Ordinary expenditures were higher than the estimates by 53,000,000 marks, and extraordinary by 7,000,000 marks. The Finnish budget for 1927 as passed by the diet on Dec. 20, 1926, authorized a total expenditure of 3,779,700,000 marks and a total revenue of 3,589,200,000 marks. The budget is balanced by recourse, in the amount of 190,500,000 marks, to the cash reserve of budget surpluses returned in previous years. Anticipated revenues were higher by 440,700,000 marks than the corresponding estimates for 1926, and expenditures were increased by 366,000,000 marks. The surplus estimated from the ordinary budget is more than absorbed by the increased expenditure in the extraordinary budget.

On Dec. 1, 1926, the foreign debt totaled 2,350,300,000 marks and the internal debt amounted to 528,600,000 marks or a total of 2,878,900,000 marks (\$103,100,000). The entire debt is funded. The budget expenditures in connection with debt service were greatly increased for 1927, showing a total of 505,000,000 marks against 250,400,000 in the 1926 budget. In addition to the interest payments on the various loans, the budget for 1927 carried the amount of 217,400,000 marks for payment of principal in addition to the interest on the 6½ per cent loan of 1921, which accounts for the large increase in the amount for debt service.

COMMUNICATIONS. The preliminary report of the Finnish State Railway Administration for 1926 showed net profits amounting to 131,000,000 marks, as compared with 163,000,000 marks for 1925. The decrease is due to an increase of 83,000,000 marks in ordinary expenses. The length of the Finnish railways at the end of 1926 totaled 4561 kilometers, of which 194 kilometers represented double track. Rolling stock in operation comprised 558 locomotives (533 in 1925); 1210 passenger cars (1122 in 1925); and 18,389 freight cars (17,804 in 1925). Passengers carried numbered 21,784,300, yielding total receipts of 247,086,100 marks, as compared with 21,434,900 passengers and receipts of 240,303,000 marks in 1925. Income from freight traffic reached 509,915,200 marks as compared with 460,121,200 marks in 1925.

The mercantile marine of Finland on Jan. 1, 1926, aggregated 4865 vessels of 480,994 net registered tons, and consisted of 541 sailing vessels of 83,302 tons; 566 steam vessels of 105,307 tons; 97 motor boats and 3661 lighters. The shipping entering the ports of Finland represented 7682 vessels of 3,885,730 tons; cleared, 7318 of 3,800,825 tons.

GOVERNMENT. According to the constitutional law of July 17, 1919, Finland is a republic. Executive power is vested in a president elected for six years by the votes of the citizens and in a ministry appointed by him but responsible to the house of representatives; legislative power in a house of representatives consisting of 200 members chosen by direct and proportional election, all male and female citizens who have reached their 24th year possessing the right to vote. President of the Republic in 1927, Dr. Lauri Relander, elected Feb. 16, 1925. The Council of State as appointed Dec. 13, 1926, was as follows: Prime Minister, Vaino Tanner; Foreign Affairs, Dr. V. Voionmaa; Finance, Dr. A. Ryoma; Interior, R. Itkonen; Defense, K. Heinonen; Justice, V. Hakkila; Education, Dr. J. Ailio; Agriculture, M. Pekkala; Communications, V. Vuolijoki; Commerce and Industries, V. Hupli; Social Affairs, Dr. J. Helo; Minister without Portfolio, M. Paasivuori.

HISTORY. For the election of Finland to a position of non-permanent member of the council of the League of Nations, consult article on LEAGUE OF NATIONS. Finland enjoyed a prosperous and quiet year, no untoward incident being reported in the press.

FIRE ARMS. RESTRICTING SALES OF. See CRIME.

FIRE INSURANCE. See INSURANCE; FIRE PROTECTION.

FIRE PROTECTION. In 1927 according to the monthly record of fire losses maintained by the *Journal of Commerce*, New York, it was noted that the improvement in the burning ratio started about September, 1926, had continued almost uninterruptedly until the close of 1927. Some of the insurance company executives attributed this to the burning out of the "moral hazard" lines, the better housekeeping in industrial risks and in no small measure to the check in the premium grabbing policy of the companies themselves, which made it difficult for the unscrupulous to secure over-insurance. The three-year monthly loss table follows:

	1925	1926	1927
January	\$41,210,400	\$41,118,750	\$37,910,600
February	32,472,000	30,983,750	26,285,000
March	33,346,600	42,854,600	26,807,600
April	37,696,800	52,408,400	39,720,000
May	29,170,800	32,784,200	20,718,000
June	23,650,800	28,676,000	25,481,200
July	29,622,000	31,728,400	24,248,600
August	23,348,750	27,888,400	24,299,800
September	25,396,250	19,309,000	21,875,000
October	23,991,250	14,877,000	22,326,600
November	30,320,000	26,724,400	18,992,200
December	43,275,000	43,757,600	31,935,400
Total	873,500,550	893,010,500	820,595,600

While the year 1927 was considered a good year by comparison with the smallest fire losses since 1919, yet property to the aggregate value of \$320,595,600 was destroyed by fire. During the year there were no less than 3764 outbreaks of fire, each of which resulted in property loss of \$10,000 or over.

These figures vary somewhat from those of the

Committee on Statistics and Origin of Fires of the National Board of Fire Underwriters which are given herewith for a period of years.

FIRE LOSSES BY YEARS

1926	\$560,548,624	1900	\$160,929,805
1925	559,418,184	1899	163,597,830
1924	549,062,124	1898	180,598,905
1923	535,372,782	1897	116,354,575
1922	506,541,001	1896	118,737,420
1921	496,406,012	1895	142,110,233

* Estimated from Records of the Actuarial Bureau.
* Actual figures recorded.

During 1927 there was a more general awakening of commerce and industry in the matter of reducing the enormous fire waste which occurs annually in the United States and which is indicated in the accompanying tables. The matter of fire protection in its larger aspect was being discussed largely along economic lines, and it was here that the greatest advances were made. In municipal fire departments there was a general betterment and also in fire prevention and fire inspection services for a number of cities, but the latter conditions were far from ideal, though showing an improvement over previous years. It was realized by such organizations as the National Fire Protection Association that what was needed was a campaign of education bringing home to the various interests, from important large commercial organizations to the individual householder, that increased costs of taxes and maintenance were due in no small measure to the fire problem.

This did not merely concern insurance premiums, but the fact that the reduction of taxable values in cities by the burning of buildings increased real estate taxes. Also in the case of a public utility, a conflagration or other

large fire removed a large number of customers. Accordingly, the most important campaign in progress in the field of fire protection in 1927 was the sending of expert fire engineers to various cities to study the fire hazard and bring it to the attention of local authorities and business interests.

There were numerous cities in the United States where various business blocks furnished a potential hazard which might develop into a devastating fire and practically wipe out the commercial section of the city. The fire engineers would chart these areas of danger, would suggest to the municipal authorities the need of restrictions, and to the owners or to the town commercial organization, the necessity of immediate protection in the form of automatic sprinklers, additional fire walls, and the protection of window openings. In some cases local chambers of commerce paid for the expenses of these surveys and they adopted measures leading to the demolition of abandoned fire traps and the protection of risks that could not be immediately eliminated by adequate extinguishing systems and fire barriers. In these surveys stress was laid upon proper housekeeping and cleanliness secured by use of local fire departments for inspection service and the development of improved civic responsibilities.

From 1924 to 1927 the engineers of the National Fire Protection Association visited more than 80 cities and in a large number of cases the fire losses have been materially reduced.

FIRES, FOREST. See **FORESTRY.**

FISHER, SYDNEY GEORGE. American lawyer and historian, died at Essington, Pa., February 22. He was born at Philadelphia, Pa., Sept. 11, 1856, and graduated at Trinity College in 1879. He then studied law for two years at Harvard, and was admitted to the bar at Philadelphia in 1883. The Western University of Pennsylvania conferred on him the degree of L.H.D. in 1902, and he was made a Doctor of Laws by Trinity in 1902 and by the University of Pennsylvania in 1914. He devoted much of his time to writing on historical and civic subjects. His letter to the *Nation* (New York), July 30, 1880, began the movement which established the civil service reform societies throughout the United States. Among his books are: *The Making of Pennsylvania* (1896); *Pennsylvania, Colony and Commonwealth* (1897); *The Evolution of the Constitution of the United States* (1897); *Men, Women and Manners in Colonial Times* (2 vols., 1898); *The True Benjamin Franklin* (1899); *The True William Penn* (1900); *The True History of the Revolutionary War* (1902); *The Struggle for American Independence* (1908);

The True Daniel Webster (1911); *American Education* (1917); *The Quaker Colonies* (1918). He wrote many articles on field sports and other subjects of natural history and outdoor life.

FISHES. See ZOOLOGY.

FISK, WILLARD CLINTON. American lawyer and soldier, died at Jersey City, N. J., June 16. He was born in New York City, Mar. 26, 1856, and was educated at Hasbrouck Institute, New York University, and the Columbia Law School. He was admitted to the New Jersey bar and was in practice in Jersey City for the greater part of his life. He was private secretary to Governor Leon Abbett, 1884-87, and later was a member of the New Jersey Riparian Commission. Joining the Seventh Regiment of the New York National Guard in 1874, he served through all ranks and grades, being commissioned colonel in April, 1916, and commanding the regiment in active service on the Mexican frontier. When the old Seventh Regiment became the 107th U. S. Infantry in the World War, he went to France as its commander, but ill health, due to labors and exposure, compelled him to return with an honorable discharge from the service.

FISK UNIVERSITY. A coeducational institution for colored people at Nashville, Tenn.; founded in 1866. It consists of a college, a music department, and a graduate department. The total enrollment of 561 for the autumn of 1927-28 included 200 men and 361 women. Enrollment in the music department was 110. The faculty numbered 40 and there were 20 administrative officers and assistants. The library contained approximately 21,750 volumes. The productive funds for 1927-28 amounted to \$1,286,164.68, and the income to \$328,677.02. Thomas Elsa Jones, Ph.D., was president; Ambrose Caliver, M.A., dean; and Paul W. Gordon, treasurer.

FITZPATRICK, FREDERICK F. American manufacturer, president of the American Locomotive Company, died at Larchmont, N. Y., November 16. He was born near Peterborough, Ont., June 9, 1866, and after studying at St. Joseph's Academy at Chillicothe, Mo., entered railroad service as a telegraph operator. He was promoted through various grades to that of assistant to the manager of the Missouri Pacific in 1898. He became St. Louis representative of the Charles Scott Spring Company, which was merged with the Railway Steel Spring Company in 1902. In 1905 he was made general sales agent, with headquarters at New York, and in 1907 was elected vice president in charge of sales. In 1910 he was elected president, and continued in charge of the affairs of the company until 1926, when he was made chairman of the board and succeeded William H. Woodin as president of the American Locomotive Company after the Railway Steel Spring Company had been amalgamated with that organization. He was active in railway manufacturing interests, being at the time of his death president of the Montreal Locomotive Works, Ltd., the Canadian Steel Tire and Wheel Company, the American Locomotive Sales Corporation, and the Richmond Locomotive Works, a subsidiary of the American Locomotive Company. He was also a director of the American Brake Shoe and Foundry Company, the American Car and Foundry Company, the American Car and Foundry Securities Company, the Safety Car Heating and Lighting Company, the Super-Heater Company, and several

saving banks and insurance companies. At the time of his death he was vice president of the Railway Business Association.

FIUME, FYOMÉ. A small state consisting of a single city, whose independence was acknowledged by the Treaty of Rapallo between Italy and Jugoslavica, Nov. 12, 1920. After a brief and tempestuous career it was turned over to Italy by a subsequent treaty with Jugoslavica, Jan. 27, 1924. Area, about eight square miles; population at the census of 1921, 84,686.

FLAX. The flaxseed production of thirteen reporting countries for 1927 was estimated by the International Institute of Agriculture, Rome, as 9.8 per cent above their yield in 1926 and 9.1 per cent above their average production for the five years 1921-1925. The yield of these countries, including the United States, was estimated at 51,667,000 bushels in 1927 and at 47,069,000 bushels in 1926. The yields in 1927 of the more important producing countries furnishing data were estimated as follows: Lithuania 1,561,000 bushels, Poland 2,716,000 bushels, Canada 4,735,000 bushels, and India 16,280,000 bushels. The United Socialist Soviet Republics, the leading flaxseed producing country of the world, recorded a yield of 780,038,000 bushels in 1926. Argentina produced 89,092,000 bushels and Uruguay 1,970,000 bushels in the crop year 1926-27. For the crop of 1927-28 Argentina increased its area, 5.7 per cent over that of the year before and 35 per cent over the average area for the five years 1921-1925.

Estimates published by the Department of Agriculture placed the flaxseed production of the United States for 1927 at 26,583,000 bushels, or 7,248,000 bushels above the production of 1926. In both years 2,907,000 acres were devoted to the crop but the average yield per acre in 1926 was only 0.7 bushels while in 1927 it was 9.1 bushels. The average farm price on Dec. 1, 1927, was \$1.857 per bushel and on this basis the total value of the crop was \$49,373,000 while the corresponding price the year before was \$1.94 per bushel and the total crop value \$37,510,000. Of the production in 1927 of the nine States reporting 97 per cent was produced in four States of which the yields were as follows: North Dakota 10,184,000 bushels, Minnesota 7,343,000 bushels, South Dakota 5,940,000 bushels, and Montana 2,438,000 bushels. The average yields per acre were 8.2, 9.7, 10, and 10.2 bushels respectively. During the calendar year 1926 the United States imported 15,041,000 pounds of linseed oil and 22,500,000 bushels of flaxseed to meet the linseed oil requirements. Exports of flaxseed products for the year ended June 30, 1927, consisted of 609,520,000 pounds of linseed cake, 15,601,000 pounds of linseed meal, and 2,738,000 pounds of linseed oil.

The estimates of flax fibre production in 1927 reported to the International Institute of Agriculture, Rome, by some of the leading fibre producing countries were as follows: Poland 125,443,000 pounds, Belgium 116,167,000 pounds, Lithuania 85,407,000 pounds, France 48,579,000 pounds, Latvia 42,636,000 pounds, and Czechoslovakia 28,234,000 pounds. The North of Ireland in 1926 produced 13,498,000 pounds and the Irish Free State 2,567,000 pounds. The United

Socialist Soviet Republics, which produce over half of the world's supply of flax fibre, yielded 780,038,000 pounds in 1926. The United States imported 5000 tons of manufactured flax fibre during the fiscal year ended June 30, 1927. Flax in the United States was grown principally for its seed as a source of oil for painting and the manufacture of linoleum, imitation leather, soap and other substances, while flax straw was utilized only to a limited extent in the manufacture of commodities and was largely a waste product; but efforts were being made to extend its use to making binder twine, insulating material, fibre board, paper, rope, etc.

FLEA HOPPER. See COTTON.

FLEMING, JOHN DONALDSON. Dean of the University of Colorado Law School, died at Denver, Colo., August 8. He was born in Elizaville, Ky., Sept. 16, 1851, and graduated from Centre College, Danville, Ky., in 1875, graduating in law at the University of Louisville in 1879, and taking a special course in law at the University of Virginia. He began the practice of law at Leadville, Colo., in 1879, and from 1880 to 1882 was financial manager of the Robert E. Lee Mining Company. He was elected mayor of Leadville for the term of 1882-83, and served as city solicitor, 1885-86. From 1889 to 1893 he was United States district attorney for Colorado by appointment of President Harrison, and in the latter year resumed private practice in Denver, Colo. In 1903 he became dean of the law school of the University of Colorado, and in 1913 became also Thompson professor of law, holding both positions at the time of his death. Centre College conferred on him the degree of LL.D. in 1910. He specialized in laws concerning irrigation, water rights, mines and mining.

FLEMMING, JAMES KIDD. Former Premier of New Brunswick, died at Woodstock, N. B., February 10. He was born in Woodstock, Apr. 27, 1868, of Irish parentage, and was educated at the common schools and the provincial normal school. After teaching school for two years, he entered upon commercial life, becoming a lumber manufacturer and merchant. He was an unsuccessful candidate for the New Brunswick legislature in 1895 and in 1899, but in 1900, standing as a Liberal-Conservative, he was successful, and was reelected in 1903, 1908 and 1912. He served as provincial secretary and receiver general in the Hazen administration, 1908-11, and in the latter year became premier of New Brunswick, serving until 1916. He was at the same time minister of lands and mines. In the general election of 1912 he secured 46 out of the 48 members. He received the honorary degree of LL.D. from New Brunswick University in 1913. He was president and manager of Flemming & Gibson, Ltd., engaged in the lumbering business. His name figured in the Maine senatorial contest of 1926, when it was charged that Senator Arthur R. Gould, the Republican candidate, had offered a bribe of \$100,000 in connection with a railroad contract in 1913, when Mr. Flemming was premier. This charge was denied by both Senator Gould and Mr. Flemming.

FLERS, flar, ROBERT DE LA MOTTE-ANGO, MARQUIS DE. French dramatist, essayist and critic, and member of the French Academy, died at Vitel, France, July 30. He was born at Pont l'Évêque, Nov. 25, 1872, a grandson of Eugène de Rôzière, who had been a member of the In-

stitute and a senator, and a great-grandson of Charles Giraud, also a member of the Institute and a minister of public instruction. He was educated at the Lycée Condorcet, and, taking degrees in law and in letters, became a dramatic critic for *Liberté*, *Figaro*, and other papers, being literary editor of *Figaro* for several years. His work, *Vers l'Orient*, was crowned by the French Academy, and his other essays included: *Entre Cœur et Chair*; *Essais de Critique*; *Ilseé*, *Princesse de Tripoli*; *Histoire de la Courtisane Tara et de son Singe Vert*; and *La Petite Table*. His plays written in collaboration with G. A. de Caillavet included: *Le Cœur a ses Raisons*; *Les Sentiers de la Vertu*; *L'Ange du Foyer*; *Miquette et sa Mère*; *La Chance du Mari*; *La Montausier*; *L'Amour Veille*; *L'Éventail*. With Emmanuel Arène he wrote *Le Roi*, the king referred to being Edward VII of Great Britain; *Le Bois Sacré*; *L'Âne de Buridan*; *Papa*; *Prime-rose*; *L'Habit Vert*; and *Venise*. With Etienne Rey he wrote *La Belle Aventure* and *Monsieur Bretonneau*. In collaboration with G. A. de Caillavet he wrote: *Les Travaux d'Hercule*; *Chonchette*; *Le Sire de Vergy*; *Monsieur de la Palisse*; and *Pâris ou le Bon Juge*, the music being written by Claude Terrasse. He also wrote, with Caillavet, the opéras comiques *Fortino* and *Béatrice*, with music by A. Messager. In collaboration with F. de Croisset he wrote *Le Retour* and *Les Vignes du Seigneur*. He married the daughter of Victorien Sardou, the playwright. Flers was elected in 1920 a member of the French Academy, from which his *Prime-rose* and *L'Amour Veille* received the Toirac prize. He was made an officer of the Legion of Honor in 1913, and, serving during the World War, received the Croix de Guerre with four citations, and the Grand Cross of the Crown of Rumania. He was the president of the International Confederation of Authors' and Composers' Associations, which met in Rome to examine copyright laws, with the purpose of standardizing them.

FLOODS. The disastrous floods of 1927 over the central and southern parts of the Mississippi basin assumed the proportions of a national calamity, the depressing effects of which were destined to be felt for many years. All previous records for Mississippi floods were broken; the great flood of 1922 now takes second place, while that of 1882 stands third.

The lower Mississippi River normally begins to rise about the first of each calendar year; the increasing flow either passes off harmlessly or else culminates in a flood, according to circumstances. All the great floods of the Mississippi have occurred when a flood in the Ohio River has been augmented by subsequent heavy rains, coming in time and distributed over the central and lower valleys of the Mississippi basin; the inflow from the distant Rocky Mountain headwaters of the great drainage system is unimportant, and the influence of melted snow likewise seems to be negligible.

The flood of 1927 really began during the second week in August, 1926, when general rains set in over the region extending from eastern Kansas and eastern Oklahoma east-northeastward throughout the Ohio valley. By the end of August the soil over this extensive area was well saturated; and the continuance of heavy rains through September and early October resulted in floods over much of the territory, those in the Neosho Valley of Kansas and in

the lower Illinois Valley being the greatest on record; the Ohio River did not go into flood, but reached high stages.

During October and November, 1926 (normally the months of lowest water in the rivers) nearly all the main and tributary streams below the mouths of the Platte and the Des Moines were high above the normal stages for the season. With the rivers still high, a period of excessive rains set in about December 15 over the Ohio Valley and the tributary basin to the south; the December rains were especially heavy over Kentucky and Tennessee, and resulted in a record flood in the Cumberland River, a great flood in the Tennessee River, and large rises in the Green and the Ohio.

Moderate to heavy rains the latter half of January, 1927, over the Ohio Valley started a flood wave in the Ohio which continued downriver to New Orleans, reaching that place in 38 days; this was the first of a series of flood waves that passed down the river during the period from January to June, 1927, due to heavy rains in the middle drainage area. The Mississippi River went into flood in February; while the Ohio, Yazoo, Ouachita, and Red Rivers remained at high stages during January and February.

Heavy rains in March over the Missouri, Mississippi, and Ohio basins, together with moderate rains over the basins of the Arkansas and the Red, caused a general rise of the Mississippi below the mouth of the Missouri, and sent the Ohio into flood again below the mouth of Green River. April showed a general excess of rainfall over the entire drainage area of the Mississippi, especially over the Missouri basin. As a result of the March and April rains, a catastrophic flood occurred in the lower Mississippi Valley; the Missouri and Ohio rose; the Green, Wabash, St. Francis, Black, White, Ouachita, and lower Red went into flood; and the Arkansas had the greatest flood since 1833.

The occurrence of great crevasses in the levees in Arkansas, Mississippi, and Louisiana prevented the lower Mississippi River from attaining the stages that would otherwise have been reached; and on April 25, the rise at New Orleans was halted by dynamiting the levee at Caccarnvon, fourteen miles below the city.

During May, June, and July there was a very slow general recession; but heavy rains caused supplementary rises in May and again in June, which resulted in flood stages again being attained at many places, and a great deal of crop land that had been planted was reinundated. At Baton Rouge, La., the river did not fall below flood stage until July 14; and the last overflow water did not pass into the Gulf of Mexico until after Aug. 1, 1927.

The total area of lands overflowed was estimated by officials of the U. S. Weather Bureau to have been 28,573 square miles, of which about one-fourth was crop land; 214 lives were lost in the lower Mississippi basin, and (in May) 94 in the mountain districts of Kentucky, Virginia, and North Carolina. It is difficult to determine the monetary loss, but careful estimates place it as \$284,117,631 (exclusive of most railroad losses), though this was almost certainly 25 per cent short of the actual.

The progress of the several flood waves was accurately forecast by the Weather Bureau, and warnings were issued one to two weeks or more

in advance. The most original service was furnished when the necessity arose of forecasting the depth of the wave of crevasse water that passed overland through the Atchafalaya Basin to the Gulf; timely warnings were given of the flooding of parts of the Atchafalaya Basin that never before in the 200 years since the settlement of the region had been reached by flood waters. The Weather Bureau warnings were the means of saving many lives, and over \$30,000,000 worth of property, besides aiding greatly in the relief work, and were warmly commended by many individuals, corporations, and other organizations.

NEW ENGLAND AND EASTERN NEW YORK FLOODS. During the night of November 2, meteorological conditions suitable for the occurrence of heavy precipitation began to form over the northeastern United States, and by the evening of November 3 torrential rains had fallen over eastern New York and western New England. Heavy rains continued during the night of November 3 over the Hudson valley and Western New England; and as they moved on to Maine, Quebec, and Western New Brunswick, light rain continued to the west and south. As an inevitable consequence, disastrous floods occurred in the Hudson Valley, virtually all of Vermont, New Hampshire, Massachusetts, and western Connecticut; and lesser floods were experienced in Western Maine, Eastern Connecticut, and Rhode Island. The flood was most severe in the Winooski valley of Vermont, where the loss of life and destruction of property were so vast as to mark the disaster as the greatest in the history of the valley.

So heavy was the rain that the floods reached destructive proportions some hours before the rains had ceased; and most unfortunately they occurred during the night over much of the region. A remarkable feature was the rapidity with which the rivers rose; there was no time for preparation except in the lower Connecticut valley, and in many places there was no time for escape. Considering the comparatively small area, the loss of life and of property in the floods was staggering.

In the drainage basins of the Winooski and Connecticut Rivers, the foundation for the flood was laid by moderately heavy rains in October which saturated the soil and filled the streams; after the heavy November rains, the waters rose to unprecedented heights. About 90 per cent of the drainage basin of the Winooski and its tributaries (comprising about 1000 square miles) is within the hills, mountains, and valleys where eight or more inches of rain fell on November 3 to 4; the length of the river proper is about 60 miles, and the discharge at the mouth reached about 100,000 second-feet. About eight feet of water covered the entire business district of Montpelier, Vt. Further damages resulted from subsequent rises after heavy rains, on November 17 and December 1.

At White River Junction, Vt., the Connecticut River rose nearly 30 feet in 24 hours. On the Androscoggin River, the flood was the highest known at many points. The runoff in the Hudson valley from the eastern tributaries was unprecedented; the U. S. Geological Survey reported a discharge of 29,700 second-feet for the Hoosic River near Eagle Bridge, N. Y., a runoff of 58 second-feet per square mile; for Poestenkill Creek, near Troy, N. Y., the discharge

was 7150 second-feet, a runoff of 81.3 second-feet per square mile.

According to the best information available, 88 lives were lost, of which 63 were in Vermont; of the latter, 48 occurred in the Winooski valley, Waterbury alone having 21. The property losses exceeded \$32,600,000, in addition to heavy railroad losses. Traffic was not restored on the Central Vermont R. R. until the following February.

FLORIDA. POPULATION. A State census was taken in 1925. The result showed a total population of 1,263,549, compared with 968,470 by the Fourteenth United States census of 1920, an increase of 295,079 in the five-year period. The estimated population of the State on July 1, 1927, was 1,363,000. The capital is Tallahassee.

AGRICULTURE. The following table gives the acreage, production and value of the principal crops in 1926 and 1927:

Crop	Year	Acreage	Prod. bu.	Value
Corn	1927	573,000	7,449,000	\$7,226,000
	1926	551,000	7,714,000	7,097,000
Potatoes	1927	29,000	3,045,000	5,633,000
	1926	24,000	2,832,000	8,496,000
Sweet potatoes	1927	29,000	2,668,000	2,268,000
	1926	28,000	2,800,000	3,500,000
Cotton	1927	66,000	17,000 ^a	1,624,000
	1926	105,000	82,000 ^a	1,632,000
Tobacco	1927	8,800	8,228,000 ^b	2,880,000
	1926	6,000	5,808,000 ^b	2,195,000
Peanuts	1927	44,000	28,160,000 ^c	1,042,000
	1926	39,000	26,520,000 ^c	1,193,000
Hay	1927	99,000	67,000 ^c	1,209,000
	1926	86,000	61,000 ^c	1,322,000

^a bales, ^b pounds, ^c tons.

MINERAL PRODUCTION. The production of phosphate rock yielded in 1925, the latest year of available statistics, more than half of the total value of the State's mineral product, and in the production of this substance Florida maintained the lead among the States. Production was, in quantity, 2,020,964 long tons in 1925 and in 1924, 2,432,581 short tons; in value, \$8,789,070 in 1925 and in 1924, \$8,017,470. Stone was produced in the amount of 4,026,790 short tons in 1925 and of 2,973,360 short tons in 1924; in value, \$4,087,107 in 1925 and in 1924 of \$2,942,778. Fuller's earth and sand and gravel were produced in 1925 in value totals in each case in excess of \$1,000,000. The mineral production of the State totaled, for 1925, \$16,650,659; for 1924, \$13,120,295.

FINANCE. As reported by the U. S. Department of Commerce, payments for maintenance and operation of the general departments of the State government in the fiscal year ending June 30, 1926, were \$10,151,395; their rate per capita was \$7.87. They included \$810,947 apportioned for education. Totals not included above, of \$634,617 for interest payments and of \$9,283,932 for permanent improvement outlays, brought the aggregate of State expenditure to \$20,069,944. Of this \$310,130 was paid by State government agencies to other State government agencies for services rendered; and \$8,318,230 was for highways; for maintenance, \$1,014,591 and \$7,303,689 for construction. Revenue receipts were \$28,687,860; or per capita, \$22.24. Of their total, property and special taxes yielded 31.6 per cent, attaining a per capita rate of \$7.03. Earnings

of departments and compensations paid the State for officials' services supplied 7.1 per cent of revenue; 52.1 per cent was derived from sale of licenses, chiefly on incorporated companies and on motor vehicles, and from a tax on sales of gasoline. Net State indebtedness on June 30, 1926, was \$90,575, or \$0.07 per capita. Property subject to ad valorem taxation had a total valuation of \$620,902,028. State taxes levied were \$6,545,894, or \$5.07 per capita.

TRANSPORTATION. The total of miles of railroad line in the State on Jan. 1, 1927, was 5533.16. There were built in 1927, according to the *Railway Age*, 124.48 miles of first track and 6.30 miles of second track.

EDUCATION. The creation by the Legislature (see *Legislation*, below) of a considerable educational equalization fund made the State a prospective substantial participant in the support of public schools within its territory. The school population of the State as estimated in 1927 was 450,000, approximately. There were enrolled in the public schools, in the scholastic year 1926-27, 369,732 pupils. Of these 38,280 were in high schools. Expenditures for public school education totaled \$37,754,888. Salaries of teachers averaged \$120 a month.

CHARITIES AND CORRECTIONS. Institutions of the State devoted to the care or custody of individuals included a State hospital, prison farm, industrial school for boys, industrial school for girls, farm colony for the feeble minded and epileptic, and school for the deaf and blind. The number of patients in the State hospital for mental disease on Jan. 1, 1927, according to statistics of the U. S. Department of Commerce, was 2585; the number admitted to the hospital for the first time for treatment, in the course of 1926, was 1024.

LEGISLATION. The State legislature, which convened in April, enacted a law designed to rearrange the financial structure of the Everglades Reclamation District and to provide means for completing the drainage of the Everglades. The issue of \$20,000,000 bonds of this district, in addition to bonds already issued, was authorized. The State Internal Improvement Fund, recruited from the sale of State land in the Everglades, was devoted to the service of the indebtedness of the reclamation district, and buying in the Everglades lands sold for taxes. Additional legislation was pledged, as obligatory under the statute, if such legislation should become necessary to assure bondholders of the security of the district's debt. It was provided that the Internal Improvement Fund trustees might, when buying in lands for taxes, employ any funds to be appropriated for that purpose, but the statute did not make any actual appropriation to meet such a contingency, or to meet debt service on the bonds in the case that the resources of the fund should at any time become insufficient. A bill to prohibit the teaching of the theory of evolution in any school, college or university of the State was presented in the Legislature; the president and faculty of Rollins College presented a petition against the bill. It later failed of passage. Provision was made for State aid to the common and higher schools, out of revenue derived from ad valorem taxation, gasoline taxes, and interest on State funds on deposit.

POLITICAL AND OTHER EVENTS. The extension of the Seaboard Air Line railroad system from Palm Beach to Miami, a distance of some 70

miles, was formally opened January 8 and the West Coast extension to Naples was opened shortly after. Economic conditions in the State were on the whole much less troubled than in 1926, immediately after the halt in speculative land development, but in March several banks in the Palm Beach area suspended, owing to difficulty in realizing on resources. Oil speculation occurred in the Spring near Palm Beach, but drilling did not yield important evidences of petroleum. The State Supreme Court decided adversely to the practice of the pari-mutuel betting system at horse races and dog races in Florida, in a decree of March 9. In an attempt to seize and lynch a man arrested for murder a mob at Tampa fought with sheriff, police and militia for several hours on the night of May 30, there being one killed in the affray and 18 wounded.

OFFICERS. Governor, John W. Martin; Secretary of State, H. Clay Crawford; Treasurer, J. C. Luning; Attorney-General, Fred H. Davis; Comptroller, Ernest Amos; Superintendent of Public Instruction, W. S. Cawthon; Commissioner of Agriculture, Nathan Mayo.

JUDICIARY. Supreme Court: W. H. Ellis, Chief Justice; Associate Justices, James B. Whitfield, Armstead Brown, Glenn Terrell, Rivers H. Buford, L. W. Strum.

FLORIDA, UNIVERSITY OF. A State institution of higher education at Gainesville, Fla.; founded in 1905. In the autumn of 1927 there was an enrollment of 2001 men, distributed as follows: agriculture, 127; arts and sciences, 603; engineering and architecture, 296; law, 248; pharmacy, 65; teachers, 259; business administration, 355; graduate school, 58. There were 1228 enrolled in the summer session. The faculty numbered 150, not including student assistants and research men. In 1927 the financial condition was as follows: maintenance fund, \$762,321; annual endowment, \$10,000; value of grounds and buildings, \$4,290,000. The library contained 52,500 volumes. The president, Albert Alexander Murphree, LL.D., died suddenly on December 20.

FLOTATION. See **METALLURGY.**

FLYING, FLYING BOATS, ETC. See **AERONAUTICS.**

FLYNN, EDMUND JAMES. Canadian jurist and former premier of Quebec, died at Montreal June 7. He was born in Percé County, Gaspé, Quebec, Nov. 16, 1847, and was educated at Quebec Seminary and Laval University. He was admitted to the bar in 1873 and was made queen's counsel in 1887. From 1878 to 1900 he was a member for Gaspé in the Quebec Legislative Assembly as a Liberal-Conservative. He represented Nicolet, 1900-04, and contested the County of Quebec in 1891, and Dorchester in 1908, for the House of Commons. He was commissioner of crown lands, 1879-82, and minister

of railways and solicitor-general, 1884-87. He was minister of crown lands, 1891-96, and prime minister, 1896-97. From 1897 to 1905 he was leader of the opposition. He became professor of law at Laval University in 1874, and later dean of the law faculty. In 1914 he was appointed to the superior court of the province, and in 1920 became puisne judge of the court of appeals of the court of King's Bench. In 1878 he received the degree of LL.D. from Laval University.

FOOD AND NUTRITION. **FOOD PRICES.**

United States. The index number for wholesale prices of food reported by the Bureau of Labor Statistics, U. S. Department of Labor (*Mo. Labor Rev.*, vol. 24, p. 196) was 96.5 for September and 100 for October, 1927, as compared with 100.8 for October, 1926, according to the revised index number (1926=100). *Bradstreet's* food index number based on the wholesale prices per pound of 31 articles used for food was \$3.38 for the week ended December 24, as compared with \$3.35 for the preceding week, and \$3.48 for the week ended Dec. 23, 1926. The Bureau of Labor Statistics logarithmic curve of retail food prices based on 43 articles of food was slightly lower throughout the year than corresponding points on the 1926 curve. The retail prices on October 15 showed an increase of 1 per cent or more over the figures of Oct. 15, 1926, in 8 of the 43 foods listed in these calculations, a decrease of 1 per cent or more in 14, and practically no change in 21. The increases were in oranges, butter, cheese, and in all of the beef cuts listed, and the principal decreases in pork products, hens, fresh and storage eggs, coffee, prunes, and bananas. The average cost of all the foods listed was nearly 2.5 per cent lower on Oct. 15, 1927, than on Oct. 5, 1926, but about 1.5 per cent higher than on Sept. 15, 1927, and more than 50 per cent higher than Oct. 15, 1913. A protest against the high cost of beef was issued by the City of Boston Hotel Association, on December 10, in the form of a resolution requesting hotel patrons not to order beef until the "price and quality return to normalcy."

Other Countries. The general trend of retail food prices throughout the world may be seen from the accompanying table compiled from data reported in the *Federal Reserve Bulletin* of December, 1927. The index numbers, which had been constructed by the various foreign statistical offices, were based on the prices of a number of articles of food weighted according to different standards, but all with one exception referable to the original pre-war basis of 100. Increases of 5 points or more are shown in Austria, Belgium, Bulgaria, and Germany; decreases in France, Italy, Norway, Russia, and India; and very little change in the remaining countries.

NUTRITION INVESTIGATIONS. *Irradiation and the Antirachitic Vitamin D.* Probably the most spectacular discovery of the year in this field was that the antirachitic properties acquired by certain inert foods on suitable exposure to ultra-violet rays are due to the activation of ergosterol, a substance which is usually present in cholesterol as an impurity in the proportion of about 1 to 2000 parts, and which, after separation from cholesterol, acquires such potency on irradiation that a dose of only 0.0001 mg. daily has sufficed for the prevention or cure of rickets in rats. A significant feature of this discovery is that it is the outcome of cooperative research carried on in three countries—by Windaus in Germany (*Chem. Ztg.*, vol. 51, p. 113), Rosenheim and Webster in England (*Biochem. Jour.*, vol. 21, p. 389), and Hess in America (*Jour. Amer. Med. Assoc.*, vol. 89, p. 337). Although irradiated ergosterol is so extremely potent, doses 10,000 times greater than what is at present regarded as an effective dose produced no ill effects in rats. Irradiated ergosterol has likewise been tested on babies. György (*Klin. Wchnschr.*, vol. 6, p. 580) reported favorable results in the treatment of 25 babies from 2½ to 14 months of age, with doses of 1 to 8 mg. daily. Beumer and Falkenheim (*Klin. Wchnschr.*, vol. 6, p. 798) reported rapid healing of rickets in children from 3½ months to 2 years of age following treatment with from 2 to 3 mg. daily.

Tisdall and Brown (*Amer. Jour. Diseases Children*, vol. 34, p. 742) found that in the latitude of Toronto the sun's rays during the hours of from 11 A.M. to 1 P.M. produced a slight but definite antirachitic effect on rats during December, January, and February, and that about the first of March there was a definite increase in this effect, continuing until in April and May the antirachitic effect of the sunshine was approximately eight times as great as in December, January, and February. The remarkable increase in activity of the sunlight in the spring months was apparently due not so much to an increase in the amount of the ultra-violet rays of the length present in sunshine in winter as to the presence of rays shorter than those found in winter. They also found (*Amer. Jour. Diseases Children*, vol. 34, p. 737) that the antirachitic effect of "sky shine" (reflected rays from the sky and clouds) is from one-half to two-thirds as great as that produced by direct sunshine, showing that some benefit results from being out of doors even in the shade. They were of the opinion that little benefit can be obtained during the winter months from sunlight through various forms of special glass claimed by manufacturers to be capable of transmitting the antirachitic rays of sunshine. In the latitude of Toronto the use of such glass is probably of value, however, during the cool days of early spring. Bundesen, Lemon, Falk, and Coade (*Jour. Amer. Med. Assoc.*, vol. 89, p. 187), from readings of calibrated photographs of the solar spectrum taken daily in Chicago from November, 1926, to May, 1927, concluded that under the most favorable conditions comparatively little ultra-violet radiation of known physiological value appears in the sun's rays during the winter months in that city.

Vitamins F and G. Studies reported from various laboratories during the year confirmed the theory that vitamin B is composed of at least two separate substances, the antineuritic vitamin

and another substance thought by many to be responsible for the prevention and cure of pellagra. Since a combination of both of these factors seems to be essential for the growth-promoting function hitherto ascribed to vitamin B, Sherman (*Jour. Chem. Ed.*, vol. 3, p. 1240) suggested that the name vitamin B be retained for the mixture of the two factors as existing in food materials and other plant and animal tissues, and that the antineuritic vitamin be named vitamin F and the other factor vitamin G. Other suggestions as to appropriate names were made by various workers in the field, but this would appear to be the most logical in that it follows the alphabetical sequence which has become the custom in vitamin nomenclature and, moreover, is of peculiar significance in that by coincidence the letters F and G are the initials of the investigators most closely associated with the two factors—Funk for the antineuritic and Goldberger for the pellagra-preventive vitamin.

A beginning was made in the determination of the relative amounts of vitamins F and G in various sources of vitamin B. Salmon (*Jour. Biol. Chem.*, vol. 73, p. 493) found the green leaves of velvet beans to be richer in vitamin G than F, and the same variety of velvet beans to be richer in F than G. This suggests that seeds and leaves supplement each other as sources of the vitamin B complex. Chick and Roscoe (*Biochem. Jour.*, vol. 21, p. 698) found brewers' yeast to be a rich source of both F and G and wheat embryo rich in F but deficient in G. Whole wheat was reported by Sherman and Axtmayer (*Jour. Biol. Chem.*, vol. 75, p. 207) to be relatively richer in vitamin F than in G, and skim milk richer in G than in F. Macy et al. (*Jour. Biol. Chem.*, vol. 73, pp. 188, 203) also found cow's milk to be richer in G than in F, but concluded that human milk is richer in F than in G. Sufficient evidence was at hand to indicate that many food materials hitherto considered to be more or less deficient in vitamin B were in reality comparatively rich in either vitamin F or G and require supplementing by materials rich in the other of these factors rather than in the vitamin B complex.

If, as is generally conceded, pellagra is caused by a deficiency of vitamin G, further information on the distribution of this vitamin in common food materials, and the best means of conserving it in the preparation of food for the table is of great practical importance. Burton (*Jour. Home Econ.*, vol. 20, p. 35) found that much of the vitamin B in turnip tops and collards, widely used in the South, is lost when these green vegetables are cooked in large amounts of water and the water discarded as is the custom, but that very little loss takes place when they are cooked in a small amount of water which is not discarded. As was to be expected, there was a marked increase in pellagra during the spring and summer in the area overflowed by the Mississippi River and its tributaries, and, according to Goldberger and Sydenstricker (*U. S. Pub. Health Rpts.*, vol. 42, p. 2706), an increased prevalence in 1928 was to be looked for as a result of economic conditions "unless some important mitigating factor or factors intervene." As a temporary relief measure large quantities of yeast, known to be rich in the pellagra-preventive vitamin, were sent to the flooded area.

Attempts to Alter the Composition of Milk Through Feeding. With breast milk or cow's milk as the principal food of babies and young children, the possibility of increasing its content of indispensable factors is one which is receiving considerable attention. Sure (*Jour. Biol. Chem.*, vol. 74, p. 55) found that considerably larger amounts of vitamin B are required for lactation than for growth, and that this seems to be due in part to the inability of the mother to transfer sufficient vitamin B from her food to the milk. A much smaller amount of a vitamin B concentrate was required to complete the lactation period of rats satisfactorily when some of the vitamin was given directly to the young instead of all of it to the mother. Sure suggested (*Jour. Amer. Med. Assoc.*, vol. 89, p. 675) that a large proportion of infant mortality due to gastrointestinal disturbances may be the result of vitamin B deficiency remediable by administering some source of vitamin B as a routine measure in the same manner that orange juice is now used as a protective measure for scurvy and cod-liver oil or egg yolk for rickets. Evidence has been reported by McCollum et al. working with rats (*Amer. Jour. Diseases Children*, vol. 33, p. 230) and by Welch with human subjects (*Bul. Johns Hopkins Hosp.*, vol. 40, p. 244) that cod-liver oil administered to the mother affords a slight protection to the young against rickets.

Cows stall-fed on the usual grain mixture, alfalfa hay, and silage were reported by Hughes and coworkers at the Kansas Agricultural Experiment Station (*Jour. Biol. Chem.*, vol. 71, p. 300) to furnish milk with as high a content of vitamin C as pasture-fed cows. This was thought to indicate that the vitamin C content of the ration has no effect on the vitamin C content of the milk produced, but in a similar study by MacLeod (*Jour. Amer. Med. Assoc.*, vol. 88, p. 1947) the uniform content of vitamin C throughout the year in the milk of cows stall-fed on a ration of mixed grains, alfalfa hay, corn silage, and beet pulp was attributed to the vitamin C content of the silage used.

Considerable interest was shown during the year in the demonstration at the Pennsylvania Agricultural Experiment Station that cows do not appear to require vitamin B, but are able to synthesize it in their rumen and transfer it to their milk in appreciable amounts. Previous evidence that synthesis of vitamin B in the digestive tract is a common occurrence would seem to indicate that cows and other ruminants are not unlike other species in their vitamin B requirement, but that through their peculiar digestive apparatus conditions are particularly favorable for the synthesis of vitamin B by bacteria and utilization of vitamin synthesized.

At the Wisconsin Agricultural Experiment Station, Elvehjem, Herrin, and Hart (*Jour. Biol. Chem.*, vol. 71, p. 255) found it impossible to increase the percentage of iron in cow's milk by the use of liberal amounts of easily assimilable sources of iron in the ration and concluded that "the percentage of iron in the milk seems to be an established amount for any specific animal and cannot be varied even by drastic changes in the iron content."

The Dietary Treatment of Anemias. Continued success attended the treatment of pernicious anemia by liver feeding as recommended during the previous year by Minot and Murphy. In a report of a continuation and extension of this

treatment (*Jour. Amer. Med. Assoc.*, vol. 89, p. 759) it was announced that in a total of 105 patients treated from three months to three years with a diet furnishing about 200 gm. of liver daily there had been only three deaths, one accidental and the other two from causes other than anemia, and that in all but six of the patients the red blood cells had been maintained at a level of 4,000,000 or more per cubic millimeter except for temporary drops always associated with partial or complete omission of the prescribed amount of liver. Minot and coworkers (*Jour. Biol. Chem.*, vol. 74, p. ixix) succeeded in separating from liver a nonprotein fraction which in doses of only a few grams has given results comparable with those obtained from 200 gm. or more of whole liver. Although the chemical nature of the active portion of the liver has not been determined, it appears probable that it is specific for pernicious anemia in somewhat the same manner that insulin is a specific for diabetes. Just as insulin treatment must be accompanied by a carefully selected diet, so, according to Minot and Murphy, must treatment for pernicious anemia with the liver concentrate be accompanied by a well-balanced, adequate diet. Koessler and Maurer (*Jour. Amer. Med. Assoc.*, vol. 89, p. 768) were still of the opinion that the fat-soluble vitamins are a factor of primary importance in blood regeneration. There had been a tendency to apply the liver treatment indiscriminately to all forms of anemia, but as Brill suggested in reports of 10 cases of pernicious and four of severe secondary anemias treated by the Minot-Murphy dietary method (*Jour. Amer. Med. Assoc.*, vol. 89, p. 1215), it was quite probable that only pernicious anemia was benefited by this specific substance in liver.

Considerable confusion existed in the field of experimental anemia and its dietary treatment. This was attributed by Robschit-Robbins and Whipple (*Amer. Jour. Physiol.*, vol. 83, p. 76) chiefly to differences in the experimental conditions in the various studies reported, particularly the use of different species of animals and of different methods of producing anemia. Their own studies of the ability of various materials and iron compounds to regenerate blood hemoglobin in severe experimental anemia induced in dogs by bleeding (*Amer. Jour. Physiol.*, vol. 79, pp. 280, 271, 280; vol. 80, pp. 391, 400; vol. 83, pp. 60, 76) led them to conclude that the favorable action of such materials as liver, kidney, and spleen was not attributable solely to their iron content, and that iron salts might be more or less effective, depending upon the nature of the food material with which they are fed. Rose (*Amer. Jour. Pub. Health*, vol. 17, p. 89) reported that the simple difference of an egg a day in the diet of two groups of comparable children resulted after a considerable time in improvement in hemoglobin and red cell count and in general physical condition. Liver in amounts furnishing the same content of iron per week brought about a more rapid but less permanent increase in hemoglobin. This difference led to the suggestion that the iron in the egg is efficiently utilized, but has no special stimulating effect over the blood-forming organs, while the liver exerts a special stimulating effect.

High Cereal Diets. The emphasis during recent years on the vitamin and mineral constituents of the diet led somewhat to the disparagement of the relatively inexpensive high calorie foodstuffs,

the cereal grains, but Cowgill (*Jour. Amer. Med. Assoc.*, vol. 89, pp. 1770, 1930) showed in experiments on rats that when suitable supplementary foods were used not only whole grain cereals but certain of the milled wheat breakfast food products might be fed in amounts furnishing as much as 84 per cent of the calories of the diet with excellent growth, reproduction, lactation, and general physiological condition, and that even with 93 per cent of the diet furnished by whole grain cereals results approximating those of current normal standards are possible. The supplements first used were commercial meat residue as a supplementary source of good protein, dried cooked liver, a salt mixture, and cod-liver oil, together with 15 gm. of fresh lettuce per rat per day. Later still more simple diets were used in which the cereals were supplemented only by whole cooked egg, cane molasses, and the same amount of fresh lettuce as in the first study. Indications were obtained that in this mixture the cereal should not represent more than 65 per cent of the entire calories. This is, however, a much higher proportion than in the ordinary American diet, and corresponds more closely to the average Chinese ration. It should be noted that no milk was included in any of the diets used.

FOOT AND MOUTH DISEASE. See VETERINARY MEDICINE.

FOOTBALL. With approximately 30,000,000 spectators and \$50,000,000 in gate receipts, college football in 1927 seriously challenged professional baseball as America's national sport. A new world's record for attendance was set at Soldiers' Field, Chicago, on November 26, when 117,000 persons witnessed the gridiron clash between the teams of Notre Dame and Southern California universities. The new \$2,000,000 stadium erected at the University of Michigan to seat 86,000 was filled to capacity three times during the year. There were many unusual features of the 1927 season which served to increase the general interest in football. The new rules affecting the lateral pass, muffed punts and shift and huddle plays and the placing of the goal posts ten yards back from the scoring line appeared on the whole to work satisfactorily, although it was possible that the posts eventually might be returned to their former location.

A threatened break in relations between the United States Military and Naval Academies and the barring of Bruce Caldwell, Yale star, on the eve of the Princeton game because of ineligibility afforded themes which were widely discussed wherever football fans congregated. Non-scouting agreements also came in for their meed of criticism or praise.

Opinions as to which was the most powerful eleven in the college world as usual varied widely. Each section of the country had one or more outstanding teams, although astounding "upsets" marked the season. In the East it was generally agreed that Pittsburgh, Yale, the U. S. Military Academy and Washington and Jefferson deserved top ranking. The University of Pittsburgh went through its schedule without suffering defeat, as did Washington and Jefferson, but the latter was not called upon to face such strong opponents as the former. Yale's only reverse came early in the season at the hands of the University of Georgia, whereas the U. S. Military Academy bowed to the Elis alone.

In the Middle West the top-notch elevens were Illinois, Michigan, Minnesota, Missouri, Nebraska and Notre Dame. The South produced such sterling aggregations as Georgia Technology, Georgia, Vanderbilt and Tennessee. In the Southwest appeared the Texas Aggies and Southern Methodists, while in the Far West there were Stanford, California and Southern California.

The usual crop of All-American teams was harvested at the close of the season, the players to receive the widest recognition being Welch of Pittsburgh, Cagle of the United States Military Academy, Hake and Smith of the University of Pennsylvania, Oosterbaan of Michigan, Joesting of Minnesota, Smith of Notre Dame, Raskowski of Ohio State, Drury of Southern California, Bettencourt of St. Mary's, Hunt of Texas Aggies and Mann of Southern Methodist.

A summary of the games played by the leading colleges follows:

Pittsburgh 48, Thiel 0; Pittsburgh 33, Grove City 0; Pittsburgh 40, West Virginia 0; Pittsburgh 32, Drake 0; Pittsburgh 23, Carnegie Tech. 7; Pittsburgh 52, Allegheny 0; Pittsburgh 0, Washington and Jefferson 0; Pittsburgh 21, Nebraska 13; Pittsburgh 30, Penn State 0.

Yale 41, Bowdoin 0; Yale 10, Georgia 14; Yale 19, Brown 0; Yale 10, Army 6; Yale 19, Dartmouth 0; Yale 30, Maryland 6; Yale 14, Princeton 6; Yale 14, Harvard 0.

Army 18, Boston University 0; Army 6, Detroit 0; Army 21, Marquette 0; Army 27, Davis-Elkins 6; Army 6, Yale 10; Army 34, Bucknell 0; Army 45, Franklin and Marshall 0; Army 18, Notre Dame 0; Army 13, Ursinus 0; Army 14, Navy 9.

Washington and Jefferson 14, Waynesburg 0; Washington and Jefferson 15, Western Maryland 6; Washington and Jefferson 31, Bethany 0; Washington and Jefferson 19, Carnegie Tech. 6; Washington and Jefferson 14, Lafayette 0; Washington and Jefferson 33, Thiel 0; Washington and Jefferson 0, Pittsburgh 0; Washington and Jefferson 19, Bucknell 3.

Illinois 19, Bradley 0; Illinois 58, Butler 0; Illinois 12, Iowa State 12; Illinois 7, Northwestern 6; Illinois 14, Michigan 0; Illinois 14, Iowa 0; Illinois 15, Chicago 6; Illinois 13, Ohio State 0.

Minnesota 57, North Dakota 0; Minnesota 40, Oklahoma Aggies 0; Minnesota 14, Indiana 14; Minnesota 38, Iowa 0; Minnesota 18, Wisconsin 7; Minnesota 7, Notre Dame 7; Minnesota 27, Drake 6; Minnesota 18, Michigan 7.

Notre Dame 28, Coe 7; Notre Dame 20, Detroit 0; Notre Dame 19, Navy 6; Notre Dame 19, Indiana 6; Notre Dame 26, Georgia Tech. 7; Notre Dame 7, Minnesota 7; Notre Dame 0, Army 18; Notre Dame 32, Drake 0; Notre Dame 7, Southern California 6.

Missouri 18, Kansas Aggies 6; Missouri 7, Nebraska 6; Missouri 18, Washington 0; Missouri 9, Southern Methodist 32; Missouri 34, Northwestern 19; Missouri 18, West Virginia 0; Missouri 18, Iowa State 6; Missouri 7, Kansas 14.

Georgia Tech. 7, Virginia Military Institute 0; Georgia Tech. 18, Tulane 6; Georgia Tech. 13, Alabama 0; Georgia Tech. 18, North Carolina 0; Georgia Tech. 7, Notre Dame 26; Georgia Tech. 0, Vanderbilt 0; Georgia Tech. 28, Louisiana State 0; Georgia Tech. 19, Oglethorpe 7; Georgia Tech. 12, Georgia 0.

Professional football failed to make expected progress in 1927, poor weather conditions resulting in the majority of the clubs losing large amounts of money. The New York Giants won the National Professional Football League championship rather handily, the Chicago Bears being second.

FORD, HENRY. See AUTOMOBILES; JEWS.

FORDHAM UNIVERSITY. A Roman Catholic institution for higher education at Fordham, New York City; founded in 1841. It is the largest Catholic educational institution in America, and is under the Society of Jesus. The enrollment for 1927-28 totaled 7585 students, including 904 in the teachers' college and 385 in the graduate school, and a distribution among the other colleges as follows: law, 1504; pre-law, 570; college, 1343; business administration, 152; pharmacy, 551; social service, 299; preparatory work, 561. The registration for the summer school of 1927 was 1316. There were 200 faculty members. The endowment fund on June 30, 1927, amounted to \$106,040. There were 100,000 volumes in the library. A new building was completed in September, 1927, which provided for a new biological laboratory and lecture rooms, as well as more classroom space for about 800 additional students of the college department. President, Reverend William J. Duane, S.J., Ph.D.

FOREIGN POLICY ASSOCIATION. See INTERNATIONALISM.

FORESTRY. The age-old and universal question of the effect of deforestation on floods was brought acutely to the front by the great Mississippi floods of 1927. Forest authorities generally conceded that forests cannot be expected to prevent floods but that they can materially lessen their destructiveness by slowing down the run-off of surface water. On the upper tributaries of the Mississippi River there are vast areas of forest land which have been practically denuded by wasteful methods of cutting and subsequent fires. These areas now offer practically no resistance to the rapid movement of surface water. The United States Forest Service realizing the significance of the situation conducted a survey of the Mississippi drainage basin to determine the areas where forests or other vegetation might

be expected to exert a beneficial influence on the flow of water.

FOREST LEGISLATION. The substantial and widespread progress of the forestry movement in the United States was indicated in the activities of various State legislatures. Florida, South Carolina, and Delaware provided for the establishment of State forestry departments under the guidance of trained foresters. To further the growing of timber, California, Louisiana, Minnesota, and Wisconsin amended their constitutions so as to permit changes in the manner of taxing forest land. Louisiana and Minnesota progressed even further and passed laws putting these amendments into actual operation. Modification of the forest taxation laws was proposed in other States but failed of ratification. It is now quite generally accepted that relief in taxation on growing forests will greatly encourage planting on cut-over lands. Several of the States, Pennsylvania, Washington, Minnesota, and New York, appropriated money for the purchase of State-owned forest lands. Laws in respect to forest fires were also strengthened in several States; California, for example, limited the hunting season on deer, closed certain areas to campers, and made fire building on posted areas a misdemeanor.

THE NATIONAL FORESTS. According to the Report of the Forester, United States Department of Agriculture, the net area of the national forests at the close of the fiscal year June 30, 1927, was 158,800,425 acres, a very slight net increase, 41,214 acres, during the year. Nevertheless, actual changes were much larger than indicated. Eliminations by proclamation or executive order totaled 531,263 acres and additions 743,415 acres. Transfers by acts of Congress from the national parks to the national forests, or vice versa, accounted for the balance. The cash receipts from the national forests for the fiscal year again exceeded \$5,000,000; those from grazing fees showed a considerable increase, while timber sales declined. Satisfactory and noteworthy progress was made in the construction of roads and trails in the national forests, both with a view to affording facilities for recreation seekers and for aid in fire fighting and silviculture.

FOREST FIRES. With the statement that "never before have men been presented with such a forest fire problem as is confronted in America," W. B. Greeley, Chief Forester of the United States Forest Service, urges in his annual report that fire control be considered an important part of technical forestry, calling for special study and the development of technical methods and appliances which will facilitate control. After eight years of experience the United States Forest Service reported that aircraft had not proved as satisfactory in detecting fires as was primarily anticipated. Lookouts on towers and high points have proved much more effective, but aircraft have, however, been useful in reconnoitering large fires.

Rainy conditions in many parts of the United States in 1927 helped to reduce materially the forest fire hazard. Severe electrical storms in midsummer in California, Oregon, and Washington resulted in severe losses, but in Montana and northern Idaho, usually a region of great hazard, fire losses were practically negligible on account of abundant rains. Southern forests suffered severely from early spring fires, but, all con-

sidered, 1927 was rated as a fortunate year from the forest fire standpoint. Evidence was obtained to indicate that the widespread dissemination of knowledge on the danger and seriousness of forest fires was exerting a beneficial effect on campers and other users of the forests.

LUMBER PRODUCTION. Preliminary estimates obtained in late December from the National Lumber Manufacturers' Association of Washington, D. C., indicated a sharp decline in lumber production in 1927 as compared with 1926 and the post-war years. This situation was not unexpected, due to the slowing down in building activities, and is believed to mark a return to normal rather than to indicate any outstanding depression.

THE ALASKAN FORESTS. The United States Forest Service in its annual report announced the sale of two large Alaskan pulpwood tracts, one located near Juneau and the other near Ketchikan, containing together approximately 1,670,000,000 cubic feet and each estimated to be capable of supplying a large pulpwood plant for 50 years. Roughly estimated, there was believed to be sufficient timber in Alaska to support at least five large mills in perpetuity, and, what was even more important, there was adequate water power for these operations. The immense pulpwood resources of Alaska may be expected to offset largely the rapidly declining supply in the United States. It is estimated that probably at least five years will be required to get the mills into operation so that the shipping of pulpwood may become an actuality. Tests at the Forest Products Laboratory, Madison, Wis., showed Alaska woods to possess equal strength to those of the same species grown elsewhere.

BARK BEETLES. Sporadic but severe outbreaks of bark beetles continued to menace certain of the national forests. Control operations, which consisted of felling the trees and removing or burning the bark, were successfully employed in outbreaks in Montana and Colorado. Injury was generally most severe in trees ripe for cutting.

RESEARCH. Interest in forestry research continued to centre in the establishment and development of the regional experiment stations, nine of which have been authorized in the last few years by acts of Congress. By order of the Secretary of Agriculture the new Ohio-Mississippi Valley station was located at Columbus, Ohio, with a view to serving the timber growing interests in that great central region where the farm woodlot is often the major forestry enterprise. Logging and milling studies conducted by the Forest Products Laboratory at Madison, Wis., indicated that cutting in the northern hardwoods region of trees less than from 12 to 14 inches in diameter is frequently unprofitable. The minimum diameter returning a profit was apparently 18 inches. An astounding variation was found in the amount of waste left after logging by different companies operating in the Douglas fir regions of the Northwest, the range being from 7000 to 52,000 board feet per acre.

MISCELLANEOUS. Forestry had a part in the first International Congress of Soil Science held in Washington, D. C., June 13-22. Two sessions were devoted to forest soil problems, with interesting papers presented by investigators from various parts of the world. Interest was so keen that it was decided to establish a permanent section of the congress for forest soils. At the invitation of the United States

Chamber of Commerce a conference of representatives of wood-using industries and of forest owners was held in Chicago on November 16-17 to encourage private enterprise in the commercial growing of timber. It was quite generally accepted that timber growing is waiting largely on the remodeling of the taxation laws of most of the States. Taxes levied on the crop rather than on the land would encourage timber production and would greatly stimulate private planting. The large way in which certain States have embarked in forest seedling growing was shown in 20,000,000 trees distributed by New York in 1926 and an equal number available in Pennsylvania for 1927. The establishment of a national arboretum within the District of Columbia was authorized by Congress in the spring of 1927 and would provide for the assembly of the most complete collection of trees on the North American continent. On April 11 the new Australian Forestry School located at Canberra, the new capital of the commonwealth, was opened to students. The forestry building itself is a museum being constructed and furnished throughout with Australian timbers. Charles Lathrop Pack gave \$130,000 to Cornell University for the endowment of a research professorship in forest soils. Mr. Pack had already established himself as a patron and friend of forestry by notable gifts to the Yale Forest School, the New York State College of Forestry, and the University of Washington.

NECROLOGY. George Bishop Sudworth (q.v.) Chief of the Office of Dendrology, United States Forest Service, died May 10 at the age of 62 years. Among notable contributions from his pen are, *Forest Flora of the Rocky Mountain Region* and *Check List of the Forest Trees of the United States*. Charles Sprague Sargent (q.v.), Professor of Arboriculture in Harvard University and head of the Arnold Arboretum, died March 22. Among his many works, *A Manual of the Trees of North America* stands out from the forestry viewpoint.

FORMOSA or TAIWAN. An island belonging to Japan off the Chinese province of Fukien; formerly belonging to China but ceded to Japan, May 8, 1895. Area, 13,888 square miles; population, according to the census of 1920, 3,654,398; estimated in 1924 at 4,041,702. There were 183,317 Japanese and 31,273 foreigners on the island in 1923. Capital, Taihoku, with a population of 180,362 in 1922. Other large towns are Tainan, Kagi, and Taichu. In 1924 there were 131 primary schools for the instruction of Japanese, with 740 teachers and 23,785 pupils; and for the instruction of the natives there were 515 schools with 5149 teachers and 219,472 pupils.

Formosa produces in commercial quantities nearly every tropical, subtropical, and temperate zone product. The island supplies all the world's Oolong tea and produces nearly all the world's natural camphor. The sugar industry, however, is the most important. The production of raw sugar amounts to more than 1,000,000,000 pounds annually. The entire output is shipped to Japan, with the exception of that used in local consumption and an inferior grade shipped to China. The production of tea averages about 21,000,000 pounds annually, of which the United States takes about 10,000,000 pounds. The yield of rice is over 25,000,000 bushels. The indigo, hemp, pineapple, grapefruit, papaya, peanut,

bean, and cereal industries are also important producers. Gold, silver, and copper are mined in considerable quantities, and coal and sulphur are exported. The exports in 1925 were valued at 47,986,437 yen and the imports at 56,489,060 yen. The revenues and expenditures have grown enormously under Japanese rule and at the present time amount to about 100,000,000 yen annually. The budget has never shown a deficit. Revenues for the fiscal year beginning Apr. 1, 1926, were estimated at 99,775,266 yen, of which the taxes provide 15,554,947 yen. Government monopolies and receipts from the railroads and from other government property total 74,952,387 yen, and miscellaneous receipts provide the remainder. The principal expenditures are for communications and transportation, for the management of the government's monopolies, for forestry, and for maintenance of various administrative bureaus. The island is under a governor-general, who is supported by a well-organized force of Japanese police. Governor-general in 1927, Mitsunoshin Yamakami.

FORT STANWIX. See CELEBRATIONS.

FORTY-EIGHT, COMMITTEE OF. A political and educational movement whose platform is the abolition of the unjust economic advantage by which a small group controls natural resources, transportation, industry, and credit. It is composed of representatives from the 48 States of the Union, from which it derives its name. The principles advocated are the public control of natural resources, public ownership of railroads, governmental banking, and equal rights for all citizens. During presidential and congressional elections, pamphleteering is carried on in order to present information relative to domestic economic issues which are subjects of controversy or contest. The Committee also assists in the formation of progressive parties in the various states. During the year 1927 the Committee gave special emphasis to its educational programme, conducted by its National Bureau of Information and Education. Membership in the committee or party is on a dues-paying basis, and the amount of the monthly payment is left to the discretion of each enrolling person. National headquarters, 15 East Fortieth Street, New York. The officers for 1927 were: J. A. H. Hopkins, chairman of the executive committee; Howard R. Williams, vice chairman; Melinda Alexander, secretary; Charles H. Ingersoll, treasurer.

FOSTER, HERBERT DARLING. American educator, died in Cornwall, England, December 28. He was born at West Newbury, Mass., June 22, 1863. After graduating at Dartmouth College in 1885, he studied at Harvard where he received the degree of M.A. He also did graduate work and conducted researches in history in several European universities, and was honored by the University of Geneva, Switzerland, with the degree of Litt.D., in 1909. He taught English and history, 1885-88, and organized and conducted the department of history of the Worcester, Mass., Academy, 1888-91. From 1893 until his death he was professor of history at Dartmouth. Professor Foster was on a sabbatical leave in England at the time of his death, which was sudden. He conducted educational work for the American Expeditionary Forces, in France and Germany, in 1919, successively as acting director of the College of Letters and Sciences, head of the department of

history of the American Expeditionary Forces, at Beaune, France, and director of instruction in history. He was a fellow of the Royal Historical Society of England, and edited several works on history and the teaching of that subject.

FOX, SIR FRANCIS. British engineer, died at London, England, January 7. He was born in 1844, the son of Sir Charles Fox, and began his career as an engineer in 1861 in his father's firm, Sir Charles Fox & Sons. Later, with his elder brother, he became a member of the firm of Sir Douglas Fox and Partners, which was engaged in the execution of important engineering works, especially railways and tunnels. In 1882 he was invited to become engineer to the Manchester, Sheffield and Lincolnshire Ry., afterwards the Great Central and then merged in the London and Northeastern group. In London he was engineer in the construction of the Great Northern and City tube railway, and also of the lines from Charing Cross to Hampstead and Highgate. He was concerned with the construction of railways in Canada and in South Africa and in that of the bridge over the Zambezi at Victoria Falls. He was appointed by the Federal Government of Switzerland, on the nomination of the British government, as a member of the committee of three experts on tunneling for the construction of the Simplon Tunnel through the Alps.

In his later years. Sir Francis Fox was frequently called upon as an expert in the matter of the preservation of cathedrals and other ancient buildings, utilizing the grouting machine which had been employed with success to fill in with cement the voids outside the cast-iron segments of the London tube railways. This was used at Winchester Cathedral, 1905-12, and also at Canterbury and Lincoln, as well as in various other parts of Great Britain. In 1912 he was called upon to report upon the condition of St. Paul's Cathedral, London, and descended in diving dress, proving the existence of quicksand some 40 or 50 feet below the surface at a point near the cathedral. In 1912 he was made a knight. He was a member of the Institute of Civil Engineers. He wrote extensively, his publications including: *River, Road, and Rail*; *Sixty-Three Years of Engineering Science and Social Work*; *The Mersey Tunnel*; *The Simplon Tunnel*; *The Cape and Cairo Railway*; and *The Saving of Winchester Cathedral*. In 1919 he contributed to the *Geographical Journal* an article in which he stated that the construction of a tunnel under the English Channel presented few, if any, difficulties.

FRANCE. A republic of western Europe, lying between 42°20' and 51°5' N. latitude and 7°45' and 4°45' W. longitude. Capital, Paris.

AREA AND POPULATION. The area before the War was 207,064 square miles; total area in 1927, 212,659 square miles. The additions obtained under the Peace Treaty, and corresponding to Alsace-Lorraine under the German Empire, comprise the new departments of Bas-Rhin 1848 square miles; Haut-Rhin, 1354 square miles; and Moselle, 2403 square miles. According to the census of 1926, the population was 40,743,851, but not including the military and naval forces and the crews of merchant ships abroad. The exclusions numbered 178,534 in 1926. The population in 1921 was 39,209,518. The cities with a population of over 200,000 at the census of 1926 were as follows: Paris 2,871,-

429; Marseilles, 652,196; Lyons, 570,840; Bordeaux, 256,026; and Lille, 201,921.

According to the London *Times*, the vital statistics of France for 1926 showed in many respects a remarkable correspondence to those of England and Wales. The population of France was stated at 40,745,000; that of England and Wales in the same year was estimated at 39,067,000. In France there were 766,226 births; in England and Wales, 694,126. Marriages in France numbered 346,126; in England and Wales, 279,321. The French marriage and birth rates were respectively 17 per 1000 and 17.8 per 1000; the same rates for England and Wales were 14.3 per 1000 and 17.8 per 1000 population. France therefore had a slight advantage, both in the relative number of persons married during the year and in the relative number of births.

On the other hand the French infant death-rate compares unfavorably with that of England and Wales. There were in France, during 1926, 74,608 deaths of infants under one year of age, as against 48,503 reported deaths of infants under one year of age in England and Wales. Thus the infant death-rate per 1000 births stood in France above 80, whereas in England and Wales it was 70. These figures do not, however, do justice to the efforts which the French government was making to rescue and preserve infant life. In the year 1913 the infant death-rates of France and England and Wales were respectively 112 and 108. The disorganization caused by the War imposed a severe handicap upon the efforts of the French, and this handicap remained, to some extent. In spite of the War, in spite of the invasion of her provinces, and the inevitable dislocation of her sanitary services, she had succeeded, since 1913, in reducing her infant death-rate from 112 to 83 per 1000 population.

EDUCATION. Elementary instruction is free and compulsory between the ages of six and 13. According to the latest available statistics, those for 1924-25, there were 3736 public and private infant schools, with 366,797 enrolled pupils and 81,026 public and private primary schools with 3,827,765 enrolled pupils. Secondary education is provided by *lycées* supported by the state, colleges supported by the communes, and free schools supported by private individuals and associations. Higher education is provided by the state universities, special schools under the direction of the state, and various private schools and faculties. The accompanying tables from the *Statesman's Year Book* for 1927 show the seventeen universities of France with the date of their founding and the number of students on July 31, 1925, as well as the number of students by faculties for 1923, 1924, and 1925.

Other institutions dependent upon the ministry of public instruction include: Collège de France; Museum of Natural History (which gives instruction in the sciences); Practical School of Higher Instruction, with its seat at the Sorbonne, offering courses in history, philology, and science; *École des Beaux Arts*; and various others. Dependent upon the other ministries are various institutions of technical instruction, including schools of commerce, agriculture, mines, forestry, military and naval sciences, etc., and finally, there are numerous technical schools of a lower grade dependent upon the ministry of instruction.

PRODUCTION, ETC. Crops in 1926 in most cases were poor in quality and hardly 75 per cent of the normal in yield, owing to excess moisture and pests in the spring, followed by a drought not broken until October. Compared with 1925, the yields fell short by 25 per cent in wheat and rye, almost 35 per cent in potatoes, 20 per cent in sugar beets, and 40 per cent in most fruits. Inasmuch as the French people are great bread eaters, it naturally follows that the chief grain crop is wheat. The most productive regions of wheat are those to the west and the country around Paris. In the valley of the Rhône and the region to the southwest hard wheat is cultivated for the most part. Barley is produced especially in the west, above all in the departments of Côtes-du-Nord, Eure, and Ille-et-Vilaine, and Mayenne. Rye is cultivated chiefly in Brittany; oats in the centre and northwest; corn in the departments of Landes, Basses-Pyrénées, and Haute-Garonne.

The potato is especially cultivated in the districts of the west and central regions; also in Brittany and in the departments of Corrèze, Creuse, Dordogne, Jura, and Haute-Loire, and in the Vosges. The sugar beet is cultivated especially in the north where there are sugar refineries. The chief industry related to agriculture is wine production. The wines include the ordinary wines of the Midi, wines of the central regions and of the departments of Gers and Basse-Bourgogne. Then there are the fine wines of the Bordelais and the famous wines of Burgundy. In 1926, the wheat production was 6,765,973 tons; oats, 5,775,450 tons; rye, 846,108 tons, and barley, 1,176,045 tons. In 1925 the production of wine was 1,473,042,000 gallons and of cider 217,338,000 gallons. On Jan. 1, 1926, the number of farm animals was: Horses, 2,880,380; mules, 188,320; asses, 272,970; cattle, 14,372,980; sheep and lambs, 10,537,020; pigs, 5,792,960; and goats, 1,377,910.

The chief manufactures are sugar, alcohol,

and the textile industry. The latest statistics for the sugar industry show 107 sugar works, employing approximately 25,000 people and producing 750,280 metric tons of refined sugar. The production of alcohol amounted to 44,264,000 gallons. The silk production amounted to 3,368,000 kilos, valued at 63,684,000 francs.

MINERAL PRODUCTION. Although mining activity is conducted along a wide variety of lines, iron ore and coal far exceed other lines in importance. The production figures for 1925 unless where otherwise noted were as follows: Coal, 52,477,972 metric tons (1926); lignite, 987,000; iron ore, 35,763,000; pig iron, 9,363,000 (1926); finished iron and steel, 4,904,000; worked steel, 8,386,000 (1926); lead, zinc, silver, 30,800; copper, 118; antimony, 3200; gold ore, 57,400 tons; manganese, 3100; salt, 1,348,200; and Alsace potash products, 1,189,100. According to the U. S. Bureau of Foreign and Domestic Commerce, in 1925 the war-damaged mines of the Nord and the Pas-de-Calais regions in France had begun to produce more coal than they did in 1913. It took, therefore, only seven years for the largest coal-producing region of France to regain its former prosperity. Production continued to increase in 1926, the total output in that year being nearly 4,500,000 tons larger than that for 1925. For the whole year of 1926 the production amounted to 52,477,972 metric tons, compared with 48,033,564 in 1925. In December, 1926, alone, 4,648,069 tons of coal were produced.

The average daily production has remained high, rising from 121,064 tons in January, 1923, to 160,445 in January, 1925; 170,048 in January, 1926; and 185,922 in December, 1926. In 1913 an average daily production of 136,147 tons was recorded. In the Basin of the Nord and the Pas-de-Calais daily production during December, 1926, reached 114,920 tons, exceeding the level of 1913 by 23,622 tons. In central and southern France the daily production of 51,715 tons in December, 1926, showed an increase of 6865 tons over the 1913 figure. Consequently the mines situated within the old frontiers furnished 166,635 tons, a daily extraction exceeding the pre-war production by 30,488 tons. The Lorraine mines furnished a supplementary production of 19,287 tons per working day, their 1926 output reaching 5,244,000 tons. The production of metallurgical coke by the ovens of the French collieries amounted to 343,783 tons in December, 1926, exceeding the monthly average of 1913 by nearly 100,000 tons. The total 1926 production of the coking plants attached to the mines reached 3,767,400 tons, compared with 2,267,464 in 1924, and 4,027,424 in 1913. The production of briquettes in December, 1926, amounted to 306,804 tons, and for the whole of the year it reached 4,102,370 tons compared with 3,653,702 in 1925.

The accompanying table shows the French production of coal, coke, and briquettes for 1926, compared with that for 1925 and 1913, as well as the foreign trade in these products.

FORESTRY. The French forests have an area of more than 24,710,439 acres, or about 19 per cent of the entire country. About 17,297,308 acres belong to private interests; 4,942,088 acres to numerous communes, and 2,471,044 acres to the national government. The annual production for construction purposes is estimated at 8,500,000

FRENCH COAL PRODUCTION AND TRADE *

Item	Coal and Lignite Metric tons	Coke Metric tons	Briquettes Metric tons
Production:			
1913	40,844,218	4,027,424

* Figures for 1926 are preliminary.

cubic feet (3,604,000,000 board feet), and for firewood at 17,000,000 cubic meters. Considering the relatively small area of France, the wide diversity of trees is surprising. Among the most useful are the resinous varieties, such as the mountain spruce of the Jura and Alps, the mountain pines of Northern and Central France, the maritime pines of Southern and Southwestern France, the Aleppo pines in Provence, and the black or Austrian pine in the Champagne region and Eastern France. Among the hardwoods, oak is the most common.

COMMERCE. The total value of exports for the calendar year 1926 amounted to 59,535,000,000 francs and imports to 59,515,000,000 francs, thus leaving a favorable balance of trade of 20,000,000 francs. The volume of imports diminished and that of exports increased only in a relatively small proportion. Imports during 1926 totaled 45,513,430 metric tons—a decrease of 1,929,820 tons, as compared with 1925; the volume of exports aggregated 32,429,146 metric tons—an increase of 2,042,029 tons, over 1925. Raw materials imported showed the largest increase in value, reaching the sum of 40,367,875,000 francs, or 10,872,365,000 francs more than in 1925; in weight, however, they decreased 1,962,088,000 metric tons, totaling 39,092,227 metric tons in the 1926 period. On the export side manufactured articles evidenced the largest increase, their value of 37,789,424,000 francs representing an advance of 8,543,519,000 francs; they were higher in quantity as well. The principal suppliers, in order of importance, were the United States, Great Britain, Germany, Belgium and Luxembourg, and Italy. The largest buyers in order, were Great Britain, Belgium and Luxembourg, Germany, the United States, and Switzerland.

The recovery of the exchange value of the franc, favorable foreign trade returns in the last half of the year, high tourist expenditures, good tax returns, progress toward a genuine budget balance, and the return of popular confidence in the government were the outstanding plus factors in the French economic outlook at the close of the year 1926.

Imports into France during the first half of

1927 were valued at 27,118,000,000 francs and represented a decline of nearly 8 per cent from the corresponding values of 1926, while exports totaling 26,952,000,000 francs gained by 1.3 per cent. The lower value of imports was due principally to the drop in their franc values resulting from the appreciation of the currency, as the quantity of merchandise imported increased by more than 11 per cent over the similar period of 1926 and reached 26,056,000 metric tons. The increase occurred in foodstuffs and raw materials, imports of manufactured articles having declined sharply. Price changes were reflected also in the higher rate of increase in exports by quantity than by values; the total 18,332,000 metric tons representing an increase of nearly 15 per cent. Exports of foodstuffs fell off while those of raw materials and, to a lesser extent, manufactured articles increased. As compared with the first six months of 1913, imports increased in volume by nearly 20 per cent and exports by more than 80 per cent.

The visible foreign-trade balance shown by the foregoing figures was unfavorable to the extent of 166,000,000 francs. While this was surprisingly low, in view of the business depression that had prevailed since *de facto* stabilization of the franc took place toward the end of 1926, it was less encouraging if the trade was considered month by month. A very heavy export surplus was registered in January, attributable largely to the filling of orders for delivery abroad that were placed before the appreciation of the franc. An adverse balance in February was more than offset by an export surplus in March. During the second quarter, however, the balance each month was adverse, that of May reaching a very high figure.

Wheat, coal, and butter imports showed a heavy increase in both volume and value during the first half of 1927 as compared with the similar period of 1926. The volume of wine imports was only slightly higher, but the value doubled, reaching an exceptionally high figure. Imports of potatoes, common woods, and building material also gained in weight and value. The principal articles of import that show lower weights and values were coffee, cacao, alcohol, textile manufactures, pearls, diamonds, raw hides, prepared skins, metals, petroleum, machinery, clothing, automobiles, rubber, paper, and sulphate of ammonia. An increase in the volume and value of exports occurred in the cases of rice, pearls, diamonds, metallurgical products, raw hides, wool, ores, building materials, yarns and fabrics, prepared or worked-up skins, and paper. Export articles showing a drop in value and volume included cereals, coal, clothing, and lingerie. Exports declared to the United States during the first half of 1927 were valued at \$91,909,000, or \$24,039,000 over the exports during the similar period of 1926. Gold shipments included in the 1927 figures were valued at \$16,795,000, whereas no gold exports were recorded during the first six months of 1926.

The probability of a reduced volume of trade between the United States and France in a wide range of American commodities, because of the changes in the French tariff established in connection with the Franco-German treaty, effective September 6, 1927, imposing on certain lines of American goods duties four times as high as those applying to competing products from Germany, England, and other countries, was avoid-

ed temporarily through diplomatic exchanges toward the close of the year. (See below under *History*.) American shipments to France in the lines subjected to the fourfold duties have amounted to well over \$10,000,000 a year. The principal classes of goods affected were: Electrical equipment, heavy machinery, light machinery, and instruments; hardware and other metal products, chemicals, leather, certain textiles, earthenware and glassware, and the range of specialty products.

By the terms of the treaty, Germany granted France the benefit of the conventional duties of the German tariff, which are those hitherto paid by the United States and other countries enjoying favored-nation treatment in Germany, and, in addition, established reductions from the former rates on a list of commodities of particular interest to France. While the favored nation treaty between the United States and Germany assured American goods of the benefit of the new reduced duties, the majority of the new German duties concerned characteristic products of France and Alsace-Lorraine, mainly agricultural products, wines, and textiles, which were not shipped in quantity from the United States to Germany. The concessions granted to German goods entering France, by the terms of the treaty, had a more important bearing on American trade. On most of the products of which she was an important producer, Germany either received favored-nation treatment on the basis of existing rates, or was accorded the new minimum duties established by the partial revision of the French tariff, which went into operation simultaneously with the treaty, and affected over 400 items. Before the War, Germany enjoyed the most-favored nation treatment in the French market, a circumstance which, especially with her nearness to the northern industrial section of France, gave Germany distinct advantages as compared with other countries. Since the War, Germany had paid higher rates of duty on most of her exports to France than were levied on similar goods from other countries.

FINANCE. In the middle of the year the U. S. Bureau of Foreign and Domestic Commerce reported that the Poincaré government had continued to press its programme of financial readjustment, in spite of less favorable conditions in industry and an uncertain outlook in some lines of taxation. The steps taken since July, 1926, had brought the country not only a return of confidence but also, at least temporarily, a stable currency—stable in fact if not in law. The maintenance of this latter condition was to be one of the great tasks of the government in the immediate future. The policy of the government as to public finance in the second quarter of 1927 showed a realization of the importance of three factors—a balanced budget, a recasting of the obligations involved in the short-term debt, and steps looking toward the adjustment of the foreign debt. Undoubtedly one of the factors which in the minds of the people had stood out most clearly as typifying the financial advance had been the progress toward a budget balanced not only in form but in fact. Hopes of this sort had been repeatedly defeated before 1926, and if a balance were to be achieved in that year it would be because of very exceptional efforts on the part of the government and the taxpaying public. A provisional balance for the fiscal

year 1926, established on March 10, 1927, put the receipts for the year at 40,450,000,000 francs and the expenses at 39,375,000,000 francs giving a nominal surplus of receipts of 1,075,000,000 francs. This figure did not include the tax increases established by the law of Dec. 4, 1925, amounting to 2,700,000,000 francs, which were turned over directly to the treasury. It did not include some 1,018,000,000 francs turned over to the amortization office nor the receipts under the Dawes Plan. Neither did the balance given above include the income from the postal, telegraph, and telephone services. If all these items were added, it was estimated that the total payments by the French people during 1926 would amount to more than 48,000,000,000 francs.

It was impossible to state with any degree of accuracy what the yield of 1927 might be. Special efforts were made to hasten tax collections, but did not meet with any special degree of success. The budget estimate for 1927 passed the parliament in its final form on Dec. 19, 1926. As adopted, expenditures were estimated at 39,541,444,000 francs and revenues at 39,728,311,000 francs, giving a balance of 186,867,000 francs in revenue.

The steps taken to bring about a real budget balance would have been of comparatively little importance had not conditions developed contemporaneously, which allowed the government to put the treasury in a stronger position. The danger that the treasury might not be able to meet the heavy maturities coming due had, in fact, been one of the weakest elements in the French financial position. That it might not meet these maturities except by new inflation had in recent years been one of the chief causes of public apprehension. The steps taken to balance the budget were in themselves measures which helped to restore popular confidence. Following the renewal of confidence, investors again came to the aid of the treasury, and their support had already enabled it to put through measures to consolidate a portion of the public debt, to rearrange the maturity dates for 1927, and in large degree to reassume its normal functions as "banker of the budget."

On June 27, 1927, M. Poincaré laid before the finance committee of the Chamber of Deputies the outline of the 1928 budget proposals. Estimated receipts were set at 42,161,000,000 francs and expenditures at 41,528,000,000 francs, leaving an estimated surplus of 633,000,000 francs. It was explained that most of this surplus, or probably about 400,000,000 francs, would be applied to salary increases for employees of the postal and telegraph services and to the cost of floating a consolidation loan of May, 1927. As compared with 1927 budget estimates, the proposals for 1928 were 2,433,000,000 francs higher with regard to receipts and 1,987,000,000 francs higher on the expenditure side. No changes were proposed in taxes already in existence, and no new taxes were proposed. However, estimates of the yields of certain taxes, principally those on sales of real estate, were reduced by 390,000,000 francs, and a further reduction of 100,000,000 was made on the estimated yield from direct taxes. The increases in expenditure, over those noted in the budget for 1927, were accounted for mainly by increases in salaries of government employees for which a sum of 1,190,000,000 francs was inserted in

the budget. New increases in military pensions would absorb 650,000,000 francs to which must be added 250,000,000 francs voted for the year 1928 and carried forward for 1928. The reduction in the length of military service, bringing with it an increase in the pay of men engaged as volunteers, accounted for a further item of 300,000,000 francs in the budget bill. In order to carry out a special programme relating to agricultural production, an additional credit of 37,000,000 francs was provided.

The budget of 1927 included a sum of 15,534,000,000 francs to take care of the consolidated debt and the long-term debt, whereas in the budget for 1928 this charge was reduced to 13,560,000,000 francs, a decrease of 1,974,000,000 francs. Of this difference, 400,000,000 francs was the result of improvement in the value of the franc, the 1927 budget having been established on the basis of 150 francs to the pound sterling and the 1928 budget calculated on the basis of 124 francs. The increase in annuities received under the Dawes plan permitted the suppression of 833,000,000 francs which was inscribed in the 1927 budget against interest and payments on the public debt. The reduction in rate of interest paid by the amortization fund on its national-defense notes did away with the budget subsidy of 490,000,000 francs granted in 1927. Furthermore there was a decrease of about 300,000,000 francs in the service of the floating debt, resulting from the repayment of the debt of the Bank of France to the Bank of England and of the treasury bonds issued in England since 1924.

SHIPPING. The maritime goods traffic in the Mediterranean ports of France during 1926 fared better than that in the Atlantic and Bay of Biscay ports. Aside from Marseilles, where goods traffic was virtually the same as in 1925, the ports in this region all registered good increases. Cette rose from tenth to eighth place among French seaports, and St. Louis-du-Rhône rose from fourteenth to thirteenth. Marseilles' lead over other French ports, while greater than in 1925, was not so great as it was prior to the War. It may be mentioned, however, that if St. Louis-du-Rhône were treated as an annex of Marseilles, as is done for the ports lying near to Rouen and Bordeaux, the ascendancy of this city would be more clearly marked. The total number of vessels entering French ports in 1926 was 24,066 of 44,372,872 tons; vessels cleared, 22,351 or 37,767,574 tons.

TONNAGE OF MARITIME GOODS TRAFFIC AT
FRENCH PORTS, 1926

COMMUNICATIONS. During the calendar year 1926, the internal waterway system of France carried 38,069,000 metric tons of freight, an

amount only 7 per cent less than the 42,039,000 metric tons carried before the War, in 1913. The growth of waterway and railway traffic in France since 1860 is outlined in the following table (supplied by the U. S. Department of Commerce), which gives the length in kilometers of the water and rail systems and the volume of traffic. The volume is stated in kilometric-tons, corresponding to the American system of traffic measurement in ton-miles; that is, the volume of freight in metric tons (2200 pounds) is multiplied by the number of kilometers (0.62 mile), it is carried. The passenger traffic of the railways is computed in a corresponding manner.

COMPARISON OF WATERWAY AND RAILWAY TRAFFIC IN FRANCE, 1860-1925
[Figures in millions, except for length in kilometers]

Year	Waterways		Kilometers	Railways	
	Kilometers	Kilometric tons		Kilometric tons	Kilometric passengers
1860.....	11,100	1,901	9,167	8,120	2,521

^b Not including Nord and Paris-Orléans railways.

^c Not including Nord railway.

RAILWAYS. The length of the principal lines open for traffic in 1926 was 25,808 miles, made up as follows: State, 5610; Nord, 2374; Est, 3116; Paris-Orléans, 4630; Paris-Lyons-Méditerranée, 6064; Midi, 2608; Alsace-Lorraine, 1402. The total receipts of all seven companies in 1926 were 12,835,240,000 francs as compared with 9,937,250,000 francs in 1925. The centenary of the first railway in France, that from Saint-Étienne to Andrézieux was celebrated at Saint-Étienne on June 12, 1927. M. André Tardieu, Minister of Public Works, took part in the ceremony, an important feature of which was the unveiling of the bust of Marc Séguin, a pioneer in the development of the locomotive. Another feature of the celebration was a procession of vehicles representing various periods in the development of transportation.

The development of electric traction by the Midi Railway was one of the most important features of the movement to reduce the dependence of French transportation on foreign coal supplies. Up to June, 1927, there had been put under electric operation 507 kilometers of the total 3174 kilometers projected. To this total were added about 252 kilometers between Bordeaux and Arcachon, with branch lines to certain local points. This supplemented those already electrified stretches between Dax and Toulouse and their tributaries. The third step in the programme involved electrification of a number of lines, the most important and the first to be undertaken being that of 112 kilometers from Portet St. Simon, near Toulouse, to Aix-les-Thermes. Construction in this area was being rapidly pushed. The Midi also contemplated the electrification of two other river valleys, those of the Ariège and the Tet.

At the instigation of the French government, the central managing committee of French railroads had definitely decided to install the Westinghouse airbrake system on their freight trains. These brakes had been used for some years on all passenger trains, as well as on certain spe-

cial fast merchandise trains. Ordinary freight trains were using an antiquated system by which brakes were applied simultaneously by hand, to wheels of certain cars only throughout the train. The total cost of equipping all French freight cars with Westinghouse brakes was estimated at \$82,700,000. The annual increase in cost of operation resulting therefrom was estimated at about \$3,000,000. On the other hand, the economy resulting alone from the reduction in number of employees was calculated to be more than the cost of operation. A period of five years was allowed for the complete equipping of the freight trains. In accordance with the Dawes Plan the manufacture of the new equipment was to be

distributed between French and German manufacturers.

ARMY. The French army is divided into two forces, the metropolitan and the colonial, both under the war ministry. There are three divisions of the metropolitan forces, the active army, reserves, and territorial army. The active metropolitan army on a peace basis in 1926 numbered 216,801, including an air force establishment of 32,886. Enlistment for the metropolitan army is regulated by the law of Apr. 1, 1923, and is on a compulsory basis but liberal exemptions are allowed. Service in the active army is for 1½ years but in 1926 it was being reduced gradually to one year. Starting in 1927 service began at the age of 21. The colonial army is distinct from the metropolitan army and is made up partly of white troops and partly of colored troops. In 1926 the white troops numbered 59,000, the Foreign Legion, 10,000, and the colored troops, 180,000, making with the metropolitan army a total peace strength of 734,813. The reserves and territorial army are divided into units corresponding to those of the active metropolitan army. The gendarmerie, a police force recruited from the army but concerned with civil functions, numbered 26,856 in 1926, about half of whom were mounted. See **MILITARY PROGRESS.**

NAVY. For an account of naval conditions in France, see **NAVAL PROGRESS.**

GOVERNMENT. Under the French constitution, the president is the executive, assisted by a cabinet responsible to the Chamber. The legislative power is vested in a parliament or National Assembly, composed of a Senate and a Chamber of Deputies. The president, elected by the National Assembly by an absolute majority of vote for seven years, chooses his own cabinet; ordinarily, but not of necessity, selecting from among the members of the two chambers. The Senate is made up of 314 members aged not less than forty years, and elected by an electoral college for nine years; the Chamber of Deputies is made

up of 580 members elected by direct popular vote for four years.

The president of the republic in 1927 was Gaston Doumergue, elected June 13, 1924. The ministry, appointed July 24, 1926, was composed as follows. Prime Minister and Minister of Finance, Raymond Poincaré; Deputy Prime Minister and Minister of Justice, Louis Barthou; Interior, Albert Sarraut; War, Paul Painlevé; Marine, Georges Leygues; Foreign Affairs, Aristide Briand; Colonies, Léon Perrier; Public Instruction and Fine Arts, Edouard Herriot; Public Works, André Tardieu; Commerce, Maurice Bokanowski; Agriculture, Henri Queuille; Labor, Hygiene, Assistance, and Social Provision, André Fallières; Pensions, Louis Marin.

HISTORY

SITUATION AT THE BEGINNING OF THE YEAR. Although the Poincaré government came into power with the express understanding that it was to stabilize the franc, the entire year passed without any such move taking place, despite the fact that virtual stabilization occurred at the approximate rate of 25 francs to the dollar. Poincaré's failure legally to stabilize the currency met with severe criticism on the part of the Radical Socialist members of the National Union cabinet, although they continued to support his government because he continued to follow the foreign policy of Briand, a policy aimed toward international peace. Many of Poincaré's own followers bitterly attacked him for continuing to support the attitude of Briand toward international affairs and the League of Nations in particular, but the premier met these critics with the reply that it was only by giving Briand free rein that the cabinet was able to stand. There is little doubt that many times Briand's conciliatory policy toward Germany and his proposal to abandon the Rhine territory to Germany irked Poincaré as well as his followers.

The position of Briand and his party in the cabinet was considerably strengthened by the senatorial elections held on January 9. The Right parties to which Poincaré naturally adhered gained three seats and lost nine, while the Radical Socialists gained twelve seats and lost six. Taken as a whole the election was a strengthening of the Left parties in the Senate at the expense of the Right and Centre. Fernand Bouisson, a Socialist, was elected President of the Chamber of Deputies and Paul Doumer, a staunch supporter of Briand, was elected President of the Senate.

Poincaré's strong support of his foreign minister resulted in the Left supporting his position with regard to the stabilization of the franc. When questioned in the Chamber concerning his programme the premier stated that "We will do everything in our power to maintain the franc stable at between 122 and 123 to the pound sterling." This is a rate of approximately 25 to the dollar which prevailed throughout the entire year. Although this statement was very indefinite it did have a good effect on general business conditions which were in a serious slump. The effect was especially good when the government was able to meet all its financial obligations and accumulate foreign credits of sufficient size to be a vital factor in any stabilization scheme.

About the middle of February the premier stated that stabilization at that time was absolutely impossible and that he could not tell whether it would be possible during the lifetime of the ministry. "Those who say it can be done now are either rash or unaware of the difficulties in the way of the measure. Legal stabilization is much more difficult than *de facto* stabilization. Furthermore, even if I had plans I would not divulge them, for the only way to avoid speculation is to leave everybody in complete ignorance." Many observers were of the impression that Poincaré was very desirous of pushing the franc much higher than 25 to the dollar before stabilization took place. Naturally this latter procedure would be very welcome to the banking and creditor class and very unwelcome to the debtor class. In post-war Europe the phenomenon was repeated time and again when the question of stabilization arose, the creditor class demanding a return to pre-war value and the debtor class stoutly defending further inflation and objecting to any move that would make them pay back in a currency that had a greater purchasing power than it had had at the time it was borrowed.

THE DAUDET AFFAIR. During the summer a considerable flurry was caused in French politics by the so-called Daudet affair, which arose from the statement of Léon Daudet, the leader of the Royalist Party and editor of *L'Action Française*, that his son, who was found dead in a taxicab in 1923, had been assassinated by the police. Daudet was sentenced to five months' imprisonment for defamation because of this statement, but refused to surrender. He locked himself in his offices with almost 100 followers and it was not until the police had surrounded his "fortress" and turned fire hoses on the royalist supporters that his capture was consummated after a four-day siege. Thirty persons were injured in the mêlée.

Quite obviously the imprisonment of Daudet would give him all the attributes of a martyr, and the government determined to commute his sentence and free him on Bastille Day (July 14). The government's plan went awry, however, when Daudet by a clever trick escaped from Santé prison and disappeared as effectively as though the earth had opened and swallowed him. This Daudet affair was merely a ripple on the surface of French politics and is told here merely as one instance of the troubles of the Poincaré government. The premier was continually attempting to smooth out difficulties with one group or another that supported his government, and was always able to secure a vote of confidence whenever he asked for one, chiefly because no single party or any other group of parties was strong enough to undertake the task of struggling with the "battle of the franc."

LEGISLATION. Several important acts of legislation were passed by parliament before it adjourned for the summer session in July. One measure reorganized the army and provided for the reduction of the length of service from one and a half years to one year. Another measure, which caused the government a great deal of trouble, was the civil list bill which raised the salaries of state employees. The occasion for the government's concern was the demand on the part of the Left that the bill should be retroactive from Aug. 1, 1926. While Poincaré

recognized the justice of this demand he stoutly denied that the government had the financial means necessary to carry it out and it was only by threatening to make the matter a question of confidence in the government that he was able to carry his point.

The most important act was probably the one concerning electoral reform, a subject that had been under debate for several months. The measure as finally passed provided for the dividing of the country into 612 election districts, each one to elect a deputy. Another provision was that on the first ballot a candidate to be successful must have an absolute majority of all votes cast as well as a number of votes equal to one-fourth of all the voters on the district list. In case a second ballot is necessary, however, a nominal majority of the votes cast would elect. This new method was merely a return to the *scrutin d'arrondissement* from the *scrutin de liste*. The *scrutin d'arrondissement* is considered far more democratic than the *scrutin de liste* and is the method used in the United States for the election of members of the House of Representatives.
